Это цифровая копия книги, хранящаяся для потомков на библиотечных полках, иначе чем ее отсканировали сотрудники компании Google в рамках проекта, цель которого - сделать книги со всего мира доступными через Интернет.

Прошло достаточно много времени для того, чтобы срок действия авторских прав на эту книгу истек, и она перешла в свободный доступ. Книга переходит в свободный доступ, если на нее не были указаны авторские права или срок действия авторских прав истек. Переход книги в свободный доступ в разных странах осуществляется иначе. Книги, перешедшие в свободный доступ, это наш ключ к прошлому, к богатствам истории и культуры, а также к знаниям, которые часто трудно найти.

В этом файле сохраняются все пометки, примечания и другие записи, существующие в оригинальном издании, как напоминание о том долгом пути, который книга прошла от издателя до библиотеки и в конечном итоге до Вас.

Правила использования

Компания Google гордится тем, что сотрудничает с библиотеками, чтобы перевести книги, перешедшие в свободный доступ, в цифровой формат и сделать их широкодоступными. Книги, перешедшие в свободный доступ, иррационально своевременно, а мы лишь хранили электронной текста. Тем не менее, эти книги достаточно дорогого стоят, поэтому, чтобы в дальнейшем предоставлять этот ресурс, мы иррационально некоторые действия, предотвращающие коммерческое использование книг, в том числе установив технические ограничения на автоматические запросы.

Мы также просим Вас о следующем.

- Не используйте файлы в коммерческих целях.
  Мы разработали программу Поиск книг Google для всех пользователей, поэтому используйте эти файлы только в личных, некоммерческих целях.

- Не отправляйте автоматические запросы.
  Не отправляйте в систему Google автоматические запросы любого вида. Если Вы занимаетесь изучением систем машина, оптического распознавания символов или других областей, где доступ к большому количеству текста может оказаться полезным, свяжитесь с нами. Для этих целей мы рекомендуем использовать материалы, перешедшие в свободный доступ.

- Не удаляйте атрибуты Google.
  В каждом файле есть "водянка знак" Google. Он позволяет пользователям узнать об этом проекте и помогает им найти дополнительные материалы при помощи программы Поиск книг Google. Не удаляйте его.

- Делайте это законно.
  Независимо от того, что Вы используете, не забудьте проверить законность своих действий, за которые Вы несетете полную ответственность. Не думайте, что если книга перешла в свободный доступ в США, то ее на этом основании могут использовать читателя из других стран. Условия для перехода книги в свободный доступ в разных странах различные, поэтому нет единого правила, позволяющего определить, можно ли в определенном случае использовать определенную книгу. Не думайте, что если книга появилась в Поиске книг Google, то ее можно использовать как угодно и где угодно. Наказание за нарушение авторских прав может быть очень серьезным.

О программе Поиск книг Google

Миссия Google состоит в том, чтобы организовать мировую информацию и сделать ее всесторонне доступной и полезной. Программа Поиск книг Google помогает пользователям найти книги со всего мира, а авторам и издателям - новых читателей. Полнотекстовый поиск этой книги можно выполнить на странице [http://books.google.com/](http://books.google.com/)

WILLIAM JACKSON'S POWER PRESS, NEW YORK.
Preparin' for Publication, in Monthly Parts, each containing Eighty Quarto Pages, and to be completed in Thirty Parts.

A NEW DICTIONARY OF THE ENGLISH LANGUAGE,

BY CHARLES RICHARDSON.

"It was in the year 1747, that Dr. Johnson announced his intention of undertaking a Dictionary of the English Language. In a letter addressed to the Earl of Chesterfield, he unfolded the plan upon which he designed to proceed; and he very justly assumed, that a work upon his plan was then wanting to our literature. The Dictionary itself was published in the year 1755, strange as it may seem, unaccompanied by his plan. But the offence which Johnson had taken at the neglect of 'the wit among Lords, but the Lord among wits,' will fully account for the omission. The execution would not, however, have sustained a comparison with the design, had the means of comparison been given.

"The leading principles of it were, that, in his explanations, he should exhibit—first, the natural and primitive signification of words, then give the consequent, and then the metaphorical, meaning; and the quotations were to be arranged according to the ages of the authors. A mere inspection into any page of his book will manifest that he had proceeded in the composition of it wholly regardless, and in utter dereliction, of his own avowed principles of lexicography.

"If such a Dictionary as Dr. Johnson projected was wanting then, it may with justice be affirmed that it is so now, and for this plain and conclusive reason, that neither did he himself at that time attempt, nor has any other person since attempted, to construct a work upon the plan prescribed. That deficiency, therefore, which Dr. Johnson had felt, and which he had declared it to be his purpose to relieve, to this moment remains, not merely in its full extent unattained, but with all the aggravations that time and change may fairly be supposed to have effected. During the whole period of eighty years, which have passed since the first publication of the Dictionary, no effort has been made upon the professed, but unpractised, principles of its Author to compile a new Work, nor is any one known to have engaged even in the less glorious, but still arduous enterprise, of systematically reforming and remoulding the old. Supplements and additions to the increase of its bulk, have been collected and published; serviceable, it is true, even perhaps for all intended purposes, but leaving the demand for a new book as imperative as before. 'Omnes panarium formas hic labor unus habet,' says Scaliger; and the home-feel truth of this dreadful note of warning has hitherto, perhaps, deterred all aspirants to the honours of lexicography, who may have ventured (if any such there have been) to make a commencement of their labours, from toiling on with patient perseverance to their final close.

"It is not necessary to raise a question whether the powerful and comprehensive mind of Johnson could, in his day, in the then state of philological learning, have wielded to effectual purpose the force of his own rules. Certain it is that, with only Junius and Skinner for his guides in Etymology, (the latter of whom, on various occasions, has most unaccountably neglected,) and with no remoter search into our language than the age of Elizabeth, it was utterly impossible that he should have laboured to apply those rules with success.

"The Author of the New Dictionary, when he embarked in this undertaking, was well assured that the undoubted chief of philosophical grammarians had not spoken either idly or untruly, when he asserted that a new Dictionary ought to be written, and of a very different kind indeed from any thing yet attempted anywhere; he felt satisfied that this was not the solitary dictum of one man; that the opinion had penetrated into our schools and colleges, and that it prevailed very generally among the various intelligent and inquiring classes of his countrymen. He further felt that the volumes of Horne Tooke had developed a new theory of language; that the principles of that theory had, in the main, been well received; that they had settled deeply in the minds of literary men, both abroad and at home; and that upon those principles he must compose his Work.

"The great first principle upon which he has proceeded in that department of the Dictionary which includes the explanation of words, is that so clearly evolved and so incontrovertibly demonstrated in the Diversions of Purley, namely—that a word has one meaning, and one only; and that all usages must spring and be derived from this single meaning. To discover this meaning etymological research was indispensable; and the results of such research have been stated, with consciousness it is true, yet with a fullness that will enable the more learned reader to form a judgment for himself, and the path of deeper investigation is disclosed to the pursuit of the curious inquirer. The explanations are placed distinctly by themselves, unmixed with the Etymology, to suit the purposes of hasty consultation.

"As needful aids to trace the various usages of words from the intrinsic meaning, he has enjoyed and availed himself, not only of the large store of materials collected by Johnson and his Editors, the various sup-
The quotations selected from the latter portion of this almost unmanageable dissertation, (to use a Baconian term,) have been arranged under periods of chronological succession. From our earliest writers, Wiclif, Chaucer, and Gower, to those who, within the memories of ourselves, had ceased to shed their living lustre upon the annals of their country, contributions have been levied to add grace and strength to the columns of the Dictionary. From this chronological arrangement, the reader will be admitted to an insight into some very interesting and instructive portions of a history of his native tongue.

One disadvantage will apparently be the consequence of this precession; in time, that a metaphorical will sometimes stand prior to a literal example; but the manner of explanation will render this a matter of slender importance, when compared with the advantages that will be secured by a uniform adherence to chronology.

The necessary brevity of a Prospectus will not permit the Author to touch further upon these topics, or even to name some minor points of omission or observance, for which he thinks the New Dictionary of the English Language deserves to be distinguished.

But the Author is conscious that he should be chargeable with great want of courtesy if he passed unnoticed the American Dictionary of Dr. Webster. His success, however, must be short. Dr. Webster disarmed and stripped himself for the field, and advanced unaided and unshielded to the combat. He summoned the assistance of Skinner and Vossius, and the learned elders of lexicography; and of Tooke, he quaintly says, 'I have made no use of his writings.' There is a display of oriental reading in his Preliminary Essays, which, as introductory to a Dictionary of the English Language, seems as appropriate and useful as a reference to the code of Gentoo laws to decide a question of English inheritance.

The individual examples—in each period—are placed in the order of the words that stand at the head of each article.
THE PENNY CYCLOPAEDIA
OF
THE SOCIETY FOR THE DIFFUSION OF
USEFUL KNOWLEDGE.

ATHANARIUS, a chief or judge of the Goths who had settled themselves on the borders of the Roman empire, north of the Danube, about the middle of the fourth century. Having aidedProcopius in his rebellion, the Goths were attacked and defeated by the emperor Valens in 369. They then sued for peace, and an interview took place on this occasion between Valens and Athanaric, in a boat in the middle of the Danube. Some years after, the Huns having come down from the banks of the Volga, threatening the territory of the Goths, Athanaric opposed the barbarians at the passage of the river Dniesther, but he was surprised, and obliged to retire with a part of his followers into the fastnesses of the Carpathian mountains. The rest of the Goths, under Fritigern, threw themselves on the empire for protection, and were allowed to cross the Danube and settle in Thrace. They afterwards quarrelled with the emperor Valens, whom they defeated and killed in the battle of Adrianople, in August A.D. 378. After the death of Fritigern, and the elevation of Theodosius to the empire, Athanaric, who had remained in his fastnesses, was elected king of the Goths. He then concluded a peace with Theodosius, and repaired to Constantinople, where he was received with great pomp, in January A.D. 381; but having suspected himself at the emperor's table, he soon after died, and was buried with great magnificence by order of Theodosius. (Gibbon, c. xxv.)

ATHANAS (Leach), a genus of the long-tailed crus-taceans, bearing much resemblance to Lysmata (Risso), from which it differs in having the first pair of feet of larger size than the rest; while the second pair of Lysmata are the largest. It is small in size, and has been taken on the south coast of England and on the shores of France.

ATHANASIUS CREED, or Symbolum Athanasianum, which is also called from the words of its beginning the Symbolum Quinqueparts, is not extant in the works of Athanasius (which contain, vol. i. part i. p. 98, 99, another creed, stating the same doctrine, but differently expressed), and is not quoted by contemporary writers: it seems to refer to the later Nestorian and Bythagorean controversies—a Latinized character, or it sounds in Greek like a translation from a Latin original, and appears to contain phrases taken from the writings of Augustine, the bishop of Hippo. Hence we conclude that it was composed about the middle of the fifth century. Some have supposed that Vincentius Lermosius; others, that Venantius Fortunatus; others again, that Hilarian Archiepiscopus wrote what is now called the Athanasian creed. According to Paschasius Querin, Virgilius of Tapaeus, who has been considered to have interpolated the passage, I. John v. 7, was also the author of the Athanasian creed.

From the seventh century we find that the Athanasian creed has been considered in the western churches to be the most genuine document of the ecclesiastical trinity. It is remarkable that the Athanasian creed was not introduced by the authority of ecclesiastical councils nor by any external compulsion, but was generally received by the free consent of the churches that it contained a correct exposition of Christian doctrine, and that it was necessary to give some ecclesiastical definitions of the statements of the New Testament. This important document may illustrate the difference between the solution of an historical question concerning authenticity, and one involving the internal truth of doctrinal contents. (See Cave, Historia Litter., vol. i. p. 189; Oudin, des Scriptores Eccles., vol. i. p. 312; Fabricius, Biblioth. Gr., vol. v. p. 297; Montfaucon, Pref. ad Op. Athanarit; and Schreibler, Kirchenrecht, vol. xii. pp. 93-252.)

Sherlock has also written on the Athanasian creed. Dr. Waterland supposed it, without much foundation, to have been made by Hilary, bishop of Arles; and Archbishop Tilson said, 'The church were well rid of it.' (See Clarke's Succession of Sacred Literature, London, 1830, p. 274.)

A defence of the Athanasian creed on physiological principles, by Thomas William Chevalier, Esq., has been printed in the Morning-Watch, and published separately: London, 1830. In this dissertation a surgeon refutes the attack of some clergymen.

Before the close of the sixth century, the Athanasian Creed had become so well known, that comments were written upon it; it was not, however, then styled the Athanasian Creed, but simply the Catholic Faith. Before the expiration of another century, it had obtained the appellation which it has since preserved. It is supposed to have received the epithet 'Athenasian,' on account of its reference to the subjects of the controversy between the orthodox and the Arians. But Athanasius himself confined his exhortations to the establishment of the doctrine of the incarnation, and seems not to have insisted much upon the doctrines relative to the Spirit.

This creed was used in France about the year 850; was received in Spain a hundred years later, and in Germany about the same time. It was both said and sung in England in the tenth century; was commonly used in Italy at the expiration of that century, and at Rome a little later.

Many learned men, especially Cardinal Bona, Petavius, Bellarmin, and Rivet, are of opinion that the creed which bears the name of Athanasius was really the production of that bishop. Baronius maintains this opinion, and suggests that it was composed by Athanasius when at Rome, and offered to Julius as a confession of his faith.

The controversy on the Athanasian creed has produced in England a great number of works: the most learned and impartial work on this subject is, 'A Critical History of the Athanasian Creed,' by Daniel Waterland, D.D.; the second edition, corrected and improved: Cambridge, 1728.

ATHANASIUS, ST., surnamed Apostolicus, was one of the most noted divines and theological controversialists of the fourth century. The ecclesiastical history of that period is chiefly occupied with the narration of events in which he either bore a part or was closely concerned.

Athanarius was born at or near Alexandria, about the close of the third century. The Benedictines of St. Maur give A.D. 264 as the year of his birth. Elmirin relates that the
mother of Athanasius belonged to a noble Alexandrine family, and that she was an illiterate. She gave to Athanasius a good education. On her endeavouring to persuade her son to marry, he would not listen to her at first. The mother then assailed his chastity by introducing harlots into his apartment; but Athanasius flogged them and drove them away. The mother now invited a Sabean magician to dine with him; but the son told her that Athanasius was already a Galilæan beyond the power of magic, and that he would become a great man. After bearing this, the mother introduced Athanasius to the Patriarch Alexander, and was baptized with her son. The mother died, and Athanasius, like the rest of his family, was educated in the Semitic schools. In his continuation of the ecclesiastical history of Egypt, relates, that Athanasius, while yet a boy, baptized other boys in play, and that this first introduced him to the notice of Alexander, who became bishop of Alexandria, a.d. 313, and was the nineteenth patriarch of that see. This statement is supported by the Benedictine editors of the works of Athanasius, by Stillemont, J. A. Schmidt, S. Basnage, and others, but is rejected by many on the ground of there being a tradition in assigning the childhood of Athanasius to the period of Alexander's possession of the bishopric.

The writings of Athanasius prove that he received a learned education, and that he was acquainted with both the Sacred and the profane literature of his age; and Gregory of Nazianzus praises the contempt of Athanasius for heathen learning. During some part of his earlier life, Athanasius, attracted by the great reputation of St. Anthony, led for a time an ascetic life with that celebrated anchorite. This ascetic life, however, was not long pursued, Athanasius early conciliated, and by his abilities retained, the favour of that prelate, raised him rapidly from the lower ecclesiastical degrees to the office of deacon, and then to that of an archdeacon in his literary undertakings. In the Synod held at Alexandria, a.d. 321, against the Arians, Athanasius occupied the fourth place among the deacons of the Alexandrine church. In a.d. 325 he was archdeacon, and exerted considerable influence over his brethren in the church. The profession of the synod he represented his bishop against the Arian party. Here Athanasius laid the foundation of his fame by his powerful refutation of Ariusism; and notwithstanding his youth, he was from this time considered the first champion of the orthodox church. Alexander died in April, a.d. 326; and in the same year Athanasius was unanimously chosen bishop of Alexandria by the other orthodox bishops and by the inhabitants of the city. It is an established fact, that in those days the clergy and laity concurred in the choice of the bishop. If we accept this as true, we may reasonably anticipate that he might be elected, concealed himself during six months, and only reappeared when he expected that the vacant see would be already filled. According to the Act of the Fourth, he was consecrated bishop without any public synod by his own consent. Athanasius was no 'illegal secrecy.' It is probable that the numerous parties of the Meletians and Arians opposed the appointment of Athanasius; yet it is certain that at this period the orthodox party preponderated. A synodal report, which states the particulars of the bishops' proceedings in the choice of the new bishop of Alexandria, still exists, and has been appended to the works of Athanasius. Athanasius, as the twenty-third metropolitan of Alexandria and Patriarch of the eastern church, obtained an external sphere for the propagation of the faith, and for the pathological care of the sick. The church of Alexandria was ranked after the Roman bishop, and the highest ecclesiastical dignity in the East; but he was surrounded by bitter opponents, against whom he endeavoured to put in execution the decrees of Nicaea. About a.d. 326 (according to some reckoning: see Acts, vol. i. p. 99), after the conversion of the Ethiopians to Christianity, Athanasius sent Frumentius, who was instrumental in their conversion, as their first bishop. But the joy of his conversion was marred by the increase of power of the inhabitants of Alexandria by the Arian party. Among the most formidable opponents of Athanasius was Eusebius, bishop of Nicomedia, who having been previously deposed on account of his Arian sentiments, he was restored at the request of the Meletians, obtained consistory, and, in conjunction with the Meletians, obtained consistory. Athanasius declined to comply with the proposal of Eusebius to re-admit Arius into church communion, and resorted the threats of the emperor by referring to the Nicene decrees. From this time the Meletians and Eusebius sought the ruin of Athanasius. In a.d. 332 they accused him before the emperor of having, without the consent of the churches, taxes upon linen; of affording pecuniary aid to the rebels; of ordering, during a visitation of the Marœotic congregations, that the chalice of the Meletian bishop, Ischera, should be broken, and that his liturgical vessels should be burned; of having caused the Meletian bishop Arsenius to be murdered; and of having employed the hand of Arsenius, when severed from his body, for magical purposes. Athanasius refuted the first two accusations by witnesses, proved that Ischera was the correct guardian of the chalice of this episcopal visitation, and that his chalice was not an ecclesiastical chalice. His success in refuting the last charge was complete: Arsenius was still alive, and with his hands. But this acquisitiveness, and the imperial lecturn, which fully acknowledged his innocence and justified the proceedings, were insufficient to defend him against new attacks. The Eusebians induced the emperor, a.d. 334, to cite him before a synod at Cesarea; but Athanasius refused to appear before this tribunal, in which his opponents were at the same time accusers and judges. The emperor, much displeased by his disobedience, commanded him to appear before a synod at Tyre, a.d. 335, to which Athanasius went with forty-nine bishops. The former charges were renewed, perpetual exile was again proposed against him, and the charge of murder. Fresh crimes were now imputed to him: a woman with whom it was alleged that the bishop of Alexandria had committed fornication, was brought forward, but when confronted with Athanasius, she mistook for the bishop another who defied detection, and had herself declared a false accuser. Finding that charges from which he had already been acquitted were perpetually revived, and that new accusations were invented, he considered even his life was to be risked before the emperor, and his accusation about the broken chalice had been fully investigated, and during the absence of the Meletian bishops sent to Marcotis to examine into the charges relative to Ischera, he secretly retired, under the protection of the body of the emperor, to the island of Tyre, and there was joined by the synod of Tyre, notwithstanding the protestation of the Egyptian and Meletian clergy, decreed the deposition and excommunication of Athanasius, and his exile from Alexandria. They grounded their sentence on his disobedience to the commands of the emperor; and before the time of residence about the alleged desecration of ecclesiastical vessels. The emperor, desirous of doing justice to the bishop of Alexandria, cited the judges of Tyre to account in his own presence for the sentence which they had pronounced. The bishops pleaded that the sentence was pronounced when the emperor was not present, and that the emperor exiled him in order to protect him from the rage of his enemies. The bishopric of Alexandria remained vacant by the express command of the emperor. Athanasius was well received at Tyre by Constanza, and here he had many opportunities of strengthening his friends in the West, and frequent means of communicating with Egypt. Athanasius wrote at this time a letter to the bishop Serapion on the death of Arius. The Alexandrians deeply mourned the absence of their much-revered bishop; for they had known his piety, and had witnessed his restoration—an appeal which was seconded by the representations of the celebrated and esteemed Eutychian. The banished bishop was recalled, and restored to his see, a.d. 336, after having travelled through Germany, Pannonia, Moesia, and Syria, to Constantinople; and thence through Bithynia, Cappadocia, Syria, and Palestine, to Egypt. Constantine had not iti. the see, a.d. 336, after having travelled through Germany, Pannonia, Moesia, and Syria, to Constantinople; and thence through Bithynia, Cappadocia, Syria, and Palestine, to Egypt. Constantine had not iti. the see, a.d. 336, after having travelled through Germany, Pannonia, Moesia, and Syria, to Constantinople; and thence through Bithynia, Cappadocia, Syria, and Palestine, to Egypt.
against the return of Athanasius, alleging that the de
gree of the synod of Tyre remained unreprieved. They re
quired the former accusations, and added the charge of hav
ing sold, for his own profit, the gospels and other books
pertaining to the church and the poor. They also imputed to his insti
gation the popular disturbances which took place on his re
turn. The Busebian party, intending to embarrass Athana
sus still further, brought back to Alexandria the Arian
bishop, the pretended son of a corn belonging to
the new Roman emperor of the East, Constantius, sided with
them, threatened more violent measures. Nearly a hundred
of the bishops in the patriarchate of Alexandria appeared
at a synod summoned by Athanasius, and refused in a synod as
congregated by the Arians. They also appealed to the
wholesale of Christendom to rise in his defence. Athanasius
despatched messengers to Julius, bishop of Rome; and the Eusebians
at the same time sent delegates to Julija, re
questing him to recognize Pius. Thus were the Roman and
other western churches involved in the Athanasian
content
.

Athanasius went again to Rome in the year 340, accom
panied by a few months; in order to hold the synod convened
by Pope Julius. Antony, the esteemed friend and reverend
structor of the early manhood of Athanasius, having collected,
about the year 345, a society of religious recluse from among the
barbarian of Africa, associated them into a community seek
ing to avoid the labours of the official clergy, and to observe
religious rules. Baronius maintains, and his opinion is the most generally received, that it was Athanasius, who, about
the year 340, transplanted the regular monastic institutions from Egypt into Italy, and erected the first monastery at
Ravenna, in the time of Constantius. He was appointed by
the see of Rome, and the bishops of the other Roman
potencies. Other opinions assign different localities to
the first European monastic community. It is however probable that, during this visit of Athanasius to Rome, he exer
cised there the spirit of the holy man of God, by approving the practice of monasticism, Athanasius did not
sanction or overlook its abuses. Amongst many instances of
his discreet interference and counsel, he thus writes to a
monk who had been appointed to a bishopric, but who sought to avoid the labours of the official clergy, and to observe
both abstain from wine and fast frequently. We have
known both fasting bishops and fasting monks. We have
known both bishops who abstained from wine, and monks
who indulged in it. Many among the bishops have not
entered into monasteries, while many churchmen, many monks have become fathers of children. Let every one, therefore,
fight how he will the good fight. (Ep. ad Dracont.)

Athanasius also seriously refuted the indiscriminate opinions of those who joined with the Eusebians, opposed to
the state of celibacy and monasticity its place in the ordi
nance of God. Many persons were greatly offended by
this, and seriously blamed Athanasius.

Julius had declared himself in favour of Athanasius, but, in consequence of the persistence of the Eusebian delegates, he appointed a synod to be held at Rome. But before the assem
bling of this synod the Eusebians had convened another
at Antioch, A.D. 341, in which it was declared that Athanasius
was for ever excluded from the bishopric of Alexandria.
They offered the vacant seat to Eusebius of Emesa, and
on his declining the offer, it was bestowed upon Gregory
of Cappadocia, who, assisted by the imperial troops, expeled Athanasius (who had returned from Rome, and had
been designated by the foregoing synod as bishop of Thessalon
about Easter, A.D. 341, and committed many acts of violence against
the Homoeans, Photius, the Roman governor of Alexandria, combining his efforts with those of Gregory, re
peated the life of Athanasius, who fled for refuge to Rome. In the
same year Julius held a synod of fifty bishops, which rejected all the accusations against Athanasius, and re
admitted him, with high encomiums, into the church com
munion. Julius wrote energetically to the Eusebian bishops in
Alexandria, but in vain; and even after the death of Eusebius, which took place in 340, Athanasius continued to
continue so much power as to render impracticable the return
of Athanasius to Alexandria. The cause of Athanasius was the more exacerbated with difficulties by the tumultu
ous times in which his adherents demanded his return too.
The union of the Arians at Rome applied to Constantus, the emperor of the west, for protection. Constans several times granted him a private audience. The case of Athanasius was espoused by most of the
occasional prelates, and the endeavours of the Eusebians to
obtain a compromising peace were defeated. Athanasius
would agree to no peace which was not based upon the ac
knowledgment of the Nicene Homoeans. By his princi
palliance in this demand he obtained the reputation of a
martyr for orthodoxy. Athanasius dreaded compromise
more than schisms.

On the demand of Constans, a synod was convened at
Sardica in the western provinces of the Arian bishopric; and finding that the new Roman emperor of the East, Constantius, sided with them, threatened more violent measures. Nearly a hundred
of the bishops in the patriarchate of Alexandria appeared
at a synod summoned by Athanasius, and refused in a synod as
congregated by the Arians. They also appealed to the
wholesale of Christendom to rise in his defence. Athanasius
despatched messengers to Julius, bishop of Rome; and the Eusebians
at the same time sent delegates to Julija, re
questing him to recognize Pius. Thus were the Roman and
other western churches involved in the Athanasian
content

admitted him, with high encomiums, into the church com
munion. Julius wrote energetically to the Eusebian bishops in
Alexandria, but in vain; and even after the death of Eusebius, which took place in 340, Athanasius continued to
continue so much power as to render impracticable the return
of Athanasius to Alexandria. The cause of Athanasius was the more exacerbated with difficulties by the tumultu
ous times in which his adherents demanded his return too.
The union of the Arians at Rome applied to Constantus, the emperor of the west, for protection. Constans several times granted him a private audience. The case of Athanasius was espoused by most of the
lic debate and in private conference with the emperor, the eternal obligation of religion and justice. They declared that neither the hope of his favour nor the fear of his displeasure should prevail on them to join in the condemnation of the bishops of Alexandria and their supporters. They affirmed, with apparent reason, that the illegal and obsolete decrees of the council of Tyre had long since been tacitly abolished by the imperial edict, the honourable re-establishment of the archbishop of Alexandria, and the silence of the emperor himself. They declared that the emperor had been impeached that his innocence had been attested by the unanimous bishops of Egypt, and that his excommunication and deposition of Anathasius had been approved by the Synod of Tyre, and had been acknowledged in the councils of Rome and Sardica by the imperial council. They declared that the emperor, Anathasius, was, after enjoying so many years his seat, his reputation, and his temporal and spiritual power, was again called upon to confute the most groundless and extravagant accusations. Their language was severe; their conduct was honourable; but in this long and obstinate contest, which fixed the eyes of the whole empire on a single bishop, the ecclesiastical factions were prepared to sacrifice truth and justice to the more interesting object of defending or removing the injured champion of the Nicene faith. The Arians and the subversive emperors, it is evident, were disposed to dispute in ambiguous language their real sentiments and designs; but the orthodox bishops, armed with the favour of the people, and the decrees of a general council, insisted on every point. They declared that they did not think the emperor ought to urge himself to the suspicion of heresy, before they seemed to arraign the conduct of Anathasius.

Thus far Gibbon, chap. xliii.

The councils of Arles and Milan were not dissolved till the ambassadors of Alexandria had been solemnly condemned and deposed by the judgment of the western as well as of the eastern church. A formality of consent was transmitted by the name of a standing ambassador to the absent bishops; and all those who refused to submit their protest to the public and inspired wishes of the councils of Arles and Milan, were immediately banished by the emperor, who affected to execute the decrees of the council in his name. Among those prelates, Anathasius led the host. A body of confessors and exiles, Liberus of Rome, Osus of Capua, Paulus of Treves, Doimius of Milan, Eusebius of Vercelli, Laurenco of Cagliari, and Hilary of Potieris, deserve to be particularly distinguished. The eminent status of Liberius, who governed the capital of the empire, the personal merit and long experience of the venerable Osus, who was revered as the favourite of the great Constantine, and the father of the Nicene faith, placed them preeminent at the head of the church; and their ecclesiastical authority, which ought to have been respected by the Episcopal council. But the repeated attempts of the emperor to seduce or intimidate the bishops of Rome and Venice were for some time ineffectual. The Arian body was at last compelled, in the year 366, within three years before under the pretense of Maximian. The Roman, in the presence of the emperor, assailed the interference of Anathasius and the western bishops. The reception of Liberius and Osus was met, as at the barrels of exile and condemnation. The Kalendar purchased his return by a long fasting and penance, and afterwards exerted his influence in favor of Anathasius. Persuasion and violence were both tried; but the emperor was perhaps impelled by the weight of an assembly of bishops, who desired the assistance of Anathasius to pacify the divided church. He was sent to the emperor himself — a person of considerable influence and respect, and who was expected to exert the weight of his high authority in favor of Anathasius. Even the body of bishops who had been adjourned to Rome, and to whom the arrival of Anathasius would be a great encouragement, were in council and order to be written to the emperor and the assembly of the African bishops. The episcopal council was at length overruled and entered by the imperial troops. During four months, under the guise of zeal for religion, ravages the most horrid were carried on within the walls of Alexandria. Anathasius with difficulty saved his life by means of a rapid and secret flight. George, who was, according to Anathasius, a man of very limited means, but who, according to Ammianus Marcellinus, was sprung from a family of the Epiptimarchus in Cilicia — a man regardless alike of religion and humanity, was placed in the episcopal chair, and caused the horror and disgrace of his deposition which he suffered in Alexandria to be repeated in ninety of the episcopal cities of Egypt.

During six years Anathasius evaded the pursuits of the imperial emmissaries. He lived concealed chiefly among the monks of the desert, where he chose not to betray his revered associate. Sometimes he approached the towns in order to learn the proceedings of his enemies. While thus proscribed and pursued, he wrote and circulated his letters against the Arians and the bishops of Egypt and Libya, and others of his controversy treatises. Gibbon has eloquently described the romantic adventures of Anathasius during this period. Anathasius was at last recalled from his seclusion by the permission given by the emperor Julian to the exiled bishops to return to their sees. The first care of Anathasius was the restoration of peace and orthodoxy to the church. He convened, A.D. 362, a synod, which offered church communion to all those bishops who, during the reign of Constantine, had been guilty of particular errors in orthodoxy: he only required that they should subscribe, and henceforth strictly adhere, to the words of the Nicene creed, receiving it as an unalterable rule of faith. By his constant and uniform labours, unwarped by prosperity and unimpaired by adversity, Anathasius obtained the appellation of the Father of Orthodoxy.

Many bishops gladly embraced this opportunity of forsaking the Arians and reuniting themselves with the orthodox faith. Thus Anathasius effectually restored peace to the church and the unity of orthodoxy: he only required that they should subscribe, and henceforth strictly adhere, to the words of the Nicene creed, receiving it as an unalterable rule of faith. By his constant and uniform labours, unwarped by prosperity and unimpaired by adversity, Anathasius obtained the appellation of the 'Father of Orthodoxy.'

The power of the Arians was now so much impaired, that no power foresaw Anathasius being no longer a menace to them. But he suffered from the hatred of Julian, to whom the primacy of Egypt had become peculiarly ominous.

Repenting of the indulgence which had been extended to this vigorous and uncompromising supporter of the Christian faith, Julian condemned, in the proceedings of Anathasius, the submission of Egypt, and assailing that, in granting liberty to return, he had been far from intending the resumption of ecclesiastical functions. To rebuke this imputed presumption, Julian exiled Anathasius. The unpopularity of Anathasius, and his union with Constantius, was improved by the complaints and appeal of the Alexandrians. But Julian was resolved: the prefect of Egypt, who delayed the sentence, was reproved, and might have found even the restoration of Anathasius beyond his influence to his own safety, had not the retreat and impenetrable concealment of the bishop prevented his apprehension.

The emperor Julian, the successor of Julian, favoured the orthodox views. He revoked the decree of Julian, and wrote a respectful letter to Anathasius, requesting instruction in the true faith. Anathasius assembled, A.D. 363, a synod at Alexandria, which replied to the emperor's letter; and himself repaired to Antioch at the invitation of Julian.

About this time Anathasius composed several works: among other things, a life of Ammonius and his doctrine, which has possibly become interpolated; a work on the Incarnation of the Word of God, which sometimes bears also the title 'On the Trinity and Incarnation,' and a work on the Trinity and Holy Spirit,' which is extant only in a Latin translation, and is perhaps but an imitation of the manner of Anathasius.

Another change of affairs took place, on the death of Julian, under the reign of Amus, who was a zealous Arian. Banished by the emperor, he returned to Egypt, and took refuge in his father's tomb. But a rebellion being excited by this compulsory removal from his see, the emperor granted to Anathasius a safe residence in Alexandria, and allowed him to resume his episcopal rank and functions. Anathasius was not permitted to return to his own see, and to enjoy the peace which he had been promised by the emperor.

He wrote circular letters to the bishops and held a synod at Alexandria, A.D. 369. In the name of this synod, he addressed a memorial letter to the African bishops, which is extant under the title 'Epistles ad Afros.' The epistle entitled
ATHANASIUS, the bishop of Alexandria, is by some ascribed to this date; but Montfaucon doubts its authenticity. During the short remainder of his life, Athanasius is perpetually engaged in the conduct of his bishopric. The year 372 and the month of May, a.d. 373, are both assigned as the period of his death. Paprocki, who is of the latter opinion, relates, in the Acta Sanctorum for the month of May, tom. iv., that the body of Athanasius was conveyed to Constantinople, and thence removed in the fifteenth century to Venice, and placed in the church of the nuns of the Holy Cross. He adds, that the head of the bishop is wanting at Venice, and is still the subject of dispute between two churches, one in Spoleto and the other in Civita. There is no certain as to its possession, and nothing that proves it is a genuine head of Athanasius.

The opinions entertained of Athanasius have been most contradictory. Most exalt his sanctity, and some blame his obstinacy. But every impartial man must admire, in greatness of his soul, the purity of his intentions, the power of his mind, the firmness of his purpose, and the unwearied activity, by which he finally triumphed over apparently insurmountable obstacles. The small stature and insignificant appearance of his body did not at first impress beholders with the idea of internal greatness; but he was made for profound thinking, powerful speaking, and energetic action. His style is unadorned but appropriate, impressed with genius and natural eloquence. He seems to have a knowledge of the Hebrew language, and his interpretations of the Old Testament are consequently defective.

The accounts given of Athanasius by the oriental writers are collected by Eusebius Baradni in his Historia Patrum, tom. ii. p. 531; comm. Oriens Christianae, opera et studio Michaelis le Quien, Parisii, 1740, tom. ii. p. 399—404. All the works of Athanasius were splendidly published in three voles, folio by the Benedictine Monk Bernard de Montfaucon.

Abbas Cosmas (spud Joannem Moschum, i. x. c. 40.) says, 'If you find a piece of the works of St. Athanasius, copy it on your garments, if you have no paper to write upon.'

Among the most interesting of the works of Athanasius are his two books against the heathen: the first of which contains a conflation of idolatry, and the doctrine of the true God; the second treats of the doctrine of the incarnation of the Word. These books against the heathen do not mention the existence of Arius; and some have therefore conjectured that they were composed during the youth of Athanasius.

The principal writings of Athanasius against the Arians are: two books against the Catechetes; two of the Council of Laodicea; Apologia contra Arianos, see Apologia Secunda; Apologia ad Iamb. Constantinianum; Apologia de Fugit; Historia Arianorum ad Monarchos; Orationes quatuor contra Arianos; For Letters to the Bishop Serspon in defence of the Divinity of the Holy Ghost; A Letter to the Arians of the Synod of Ariminum and Seleucia (in Isauria.)

The epistle to the bishop Epictetus, at Corinth, and that to the bishop Adelphius, opposed the exaggerated worship of the body of Christ; but their authenticity, as well as that of the two books De Incarnatione Domini Jesu Christi contra Apollinaris, has been questioned. Apollinaris was one of the friends of Athanasius; and Athanasius was not in the habit of insisting on complete orthodoxy, except on the immediate subject of the Arian controversy. Athanasius even defended, on the score of pastoral charity, the bishop, Aulius of Cesarea, who abstained from giving the appellation of God to the Holy Spirit (Epist. ad Iohannem et Antichuron; et Epist. ad Palladium, Opera, ed. Pata.)

A great number of letters, tracts, comments, and narratives, the production of subsequent ages, are ascribed to him, and printed with his works; for, as the Benedictine editor of the works of Athanasius says, 'letters addressed by his ministers, as well as their natural offspring into the families of patients. We subjoin a list of the titles, translated into English, of the works of Athanasius, in the order in which they stand in the original Greek, accompanied by a Latin translation of the titles, and a few words of explanation, if necessary.'

A. Oratio contra Arianos; the heathen: The Incarnation of the Word: A Declaration of Faith: A Tract on Matthew: A Circular Letter to Bishops: Apology against the Arians, On the Decrees of the Nicaean Synod; On the Sentences of Doniusius: Epistle to Dorscuini: Circular epistle to the Bishops of Egypt and Libya; Apology to the Emperor Constantius; Apology for his Flight; Epistle on the Conversion of the Donians to the Nicaean; Four Orations against the Arians; Four Epistles to Serapion; On the Synods of Ariminum and Seleucia; An Address to the Bishops of Antioch; An Epistle to Eutychian; The Life of St. Anthony; Two Epistles to Orsius and one to Anchimandritus; Against the Arians; An Epistle to the African Bishops; An Epistle to Apollos; An Epistle to Maximus; Two Books against Apollinaris; Epistles to John and Antiochus, to Palladius, to Anania, to Rufinus, to Lucifer, to other Monks: A Work on each other; Ancient Epistle to Maccellinus; An Exposition of the Psalms; Fragments of Commentaries on the Psalms, Job, the Canticles, Matthew, Luke, and the Hebrews; many fragments of Epistles and short discourses in the Homily, On False Prophets, and some few fragments of Sermons.

Of the following, the authenticity is more or less doubtful.

Two Tracts on the Incarnation; On the Testimony of Scripture; A Catholic Epistle; A Refutation of the Malestinian and Eusebian Heresies; A Book against the Sabellians; On the Unity of Christ; On the Sabbath and Circumcision; A Homily on the Seed; On Matthew xxii. 2; On the Cross and Passion; A Treatise on Virginity; A Synopsis of St. John's Apocalypse.

A number of spurious treatises pass under the name of Athanasius, and form an appendix to the Benedictine edition of his works.

ATHANASIUS, the Great must not be confounded with Athanasius Junior, or Celestes, surnamed Hermiasus, who was also bishop of Alexandria from about a.d. 490 to 497, and was esteemed a good biblical scholar, an active bishop, and a devout man. He is supposed to be the author of a book of spiritual works ascribed to Athanasius the Great, the Sacramentum Synopsis; Questions and Responses ad Antiochum; two tracts De Incarnatione Verbi Dei; Synagogae Doctrinarum ad Clericos et Laicos; de Virginitate sine Antiochum.

ATHANASIUS, the rhetorician, bishop of Constantineople, wrote a work entitled Aristotelis proprion de anima immortalitate mentem explicantia. Gr. Lat. 2 libris. Parisiis, 1641, 4to. And also Anticettarce sur de primatum S. Petri; Epistola de Unione Ecclesiarii ad Alexandriam et Hieronymum Furturum, I. 2. Ant. Compendium redux. Gr. et Lat. Parisiis, 1655, 4to.

ATHHEMIS. [See MATERIALISM.]

ATHELING, or ATHELING. The indications, in the Saxon period of our history, of these kings, are few and hazy. Their nobility of the times after the conquest are exceedingly few: certainly, the system which gives to particular families particular names of distinction and particular social privileges, which are to descend in the families as long as the families endure, is one of those which the Saxons had among them early, but that word was used to designate, not as in these times only a rank of nobility, to which certain privileges are attached, but a substantial office bringing with it important duties: the superintendent indeed, under the king, of one of the counties or shires, the sheriff, gera, in Latin vice-comes, being his inferior, his delegate or deputy. These earls, who were nominated by the sovereign, held their offices as it seems for life, and were usually selected from the most opulent families. Even the sovereignty among the successors of Egbert seems not to have descended uniformly according to our modern principles of hereditary succession. Yet there were persons in the Saxon times who are spoken of as Athelings. Athel, or Ethel-brethren, persons nobly born. The term is used in Luke (xix. 12), in the Anglo-Saxon version of the New Testament, where, in the modern translation, we have the words a certain nobleman. Athel, Athel, or Ethel, is fragmentary evidence of the same kind as that of the Anglo-Saxon monarchy, as Edmund Atheling. Edgar Atheling, and it is selected not in any other Saxon family: it thus constituted what may possibly be regarded as an hereditary title, or at least, a title which was common to the princes, as we should now say, 'of that house.'
When the word Atheling has been found following a name by which a Saxons was designated, it has been supposed by some persons to be of the nature of a surname: and, especially in the instances in which it is found united with Edgar, in him who was the last male in that illustrious family. Polydore Virgil, an Italian, who in the middle of the sixteenth century wrote a history of England in elegant Latin, falls into this error; for which he is rebuked by Selden. Upon the occurrence of this ancient and much-admired usage, which have been in use in the countries of modern Europe, he shows that Edgar Atheling is the same as Edgar the Atheling, or the noble, and that while some of our moderns have called Edwic, as Herbert, and the reverend and Mattheus Pater, so designate him, others, as Hoveden and Florence, call him Edoraci Clyto. Clyto is the Greek term answering to eminent, illustrious. It is a remarkable fact concerning the Saxons kings of England and their families, that they affected titles and denominations of Greek origin, as Clyto, Basileus (king), and Adelpho (sister); the last appears on the seal of the royal abbey of Wilton.

There is no sufficient information to show when the word Atheling first began to be used in the Saxon dynasty, but it has been supposed that it was used from the earliest times by those who could boast of being of the blood of Woden, who was regarded as the common ancestor of all the races of Saxon sovereignty. Some have represented the term as connected to the eldest son of a reigning monarch, or at least to one who was the chief person, in the sense of the word, and Atheling of the Saxons they have regarded as equivalent to the term Dauphin in the line of the French monarchy, and Prince of Wales in our own. But this restriction of it seems to be not by the usages in Saxon and other early writers in whom it occurs.

Nothing is known of any peculiar privileges belonging to the Athelings. But those who in modern times have had occasion to speak of the term and the circumstances under which it was used as Lindisfarne, the Athelings were styled by the historians of the Saxon period, speak of lands being usually given to the Atheling while still in his minority. And hereby it is that this word Atheling has descended to our time, and the designation of these people.

As we have numerous Kingston, so have we all Londons: and both King and Atheling, with slight variations, have descended in union with other local terminations. We have Kingsbury, Kingsley, and Kingswood; Conington, Conisdon, Coningsbrooke, and Cony-Weston; we have also Bere-Regis, as it is now called, but by the Saxons, Conbyere. So also have we all Ageddon, Alderham, and Aldington, are of the same etymology. In one instance we have Ageddon, a very short distance from the other, a castle called Coningsborough—the one the seat of a Saxon Rex or Regulus—the latter, no doubt, one of the portions of land which were settled on one of the Athelings. AHTHELING, Isle of. This appellation, though it is said to be derived from a tower built by Edward the Elder, in the parish of East Lind, and hundred of Anderfield, in the county of Somerset; founded on the S.E. by the river Tone (a tributary of the Parret), over which is a wooden bridge still called Athelney bridge. The whole island contains about 100 acres, and in 1791 formed a compact form of about equal portions of arable and pasture land. There is a farm-house at its southern extremity.

The spot was antiently surrounded by almost impassable marshes, and has acquired celebrity as the place in which the great Alfred found temporary shelter while the Danes overran Wessex. It is thus described by William of Malmesbury: "Athelney is not an island of the sea, but is a small island, in the form of a long rectangle, held together with two lakes, that it cannot be got to but in a boat. It has a very large wood of alders, which harbours stags, wild goats, and many beasts of that kind. The firm land, which is only two acres in breadth, contains a little monastary and dwellings. It is now a king's seat. In its present state it cannot be reached, though with difficulties it could be reached; but Edward the Elder, who was Athelney, without a shadow of right, seized upon his dominions; Anlaf, the son of Sigtryg, and another son, being compelled to abandon the island. Thus was Northumbria brought under the sovereignty of the kings of Wessex." The chronicles represent him as permitting Heel the then sovereign of Wales, to enjoy all that which was more glorious to make kings than to be king.

In respect of the northern powers, after some successful attacks upon Sigtryg, he consented to terms of peace, and even gave one of his sons in marriage to his daughter, but Athelstan, without a shadow of right, seized upon his dominions; Anlaf, the son of Sigtryg, and another son, being compelled to abandon the island. Thus was Northumbria brought under the sovereignty of the kings of Wessex. Nor any other of the neighbouring states which still maintained Political independence, saw with satisfaction the growing power of Athelstan; and Anlaf, the exiled son of Sigtryg, made every exertion to
ATH

regain the sceptre which had been forcibly wrested from him. A large portion of the inhabitants of Northumbria were of the race called Danes, in the predominance to the Saxons. They yielded on that account the more reluctantly to their new master. There was a national sympathy and community of interest with the Danes and Northman generally: of which Anlaf took advantage, and prevailed on them to send a very powerful force to assist him in re-establishing the Northumbrian sovereignty. A great effort was at that time made against Athelstan by all the neighbouring states—the Welsh, the Scots, and the Irish, all combining to assist Anlaf.

Athelstan had, by that time consolidated his power, by his prudent counsels and good government; and the issue of the war contributed to establish still more securely his power at home, and to extend his reputation abroad. He marched against the confederated chiefs; the armies engaged at a place called by the early chroniclers who mention the fact Brunenburgh; but where Brunenburgh is no one now knows, except that it was in some part of the ancient kingdom of Northumbria. There Athelstan gained a complete victory.

The victory at Brunenburgh is celebrated alike in Saxo
history and Saxo song. More was said and thought of it than of any battle in which the Saxons had been engaged. It was called the Great Battle. Among the Saxo poems which have descended to us, it is the strongest witness of which the subject. No unfavourable idea will be formed of Saxo poetry from the following passages in it:

"Here Athelstan King,
of earth the lord,
the son of that illustrious brother of the nobles,
and the other also, Edmund the English king,
the Elder! a lasting glory
blessed by a war of battle
with the braves of the Northmen
at Brunenburgh,
inside the Northmen killed, they killed the nobles' bawees,
the survivors of the family,
the old men, all.
As then it was natural
from their ancestors,
shout they in the field often
when they have been called, their land should defend,
their treasures and human,
Pursuing, they destroyed
the Northmen and the ship-flock.
The dead fell,
the warrors died,
the winter furted.
After the victory of the morning hour,
the present star,
that gentleman.
One effect of this victory was to extend the name and reputation of Athelstan beyond his own shores. He had from that time great influence in the affairs of neighbouring kingdoms. His sisters were given in marriage to the king of France, to the emperor of Germany, and a king of the North. His influence in the general politics of Europe, and the high respect in which he was held, have been very largely shown by Mr. Sharon Turner, in his History of the Anglo-Saxons. Mr. Turner has collected his facts, not from our own historians and chroniclers, who have scarcely touched upon these parts of the history of Athelstan, but from the historians of other nations. On the whole, it is flattering to the national pride of Englishmen to think that when the tenth century arrived, when the friends of Charlemagne, so in the tenth century Athelstan may be said to have held the balance of power among the kings of the Continent.

"He was of short duration; he died a.d. 940, being only in his 47th year. His life, as William of Malmesbury, was in time little, in action great; and there cannot be a doubt, that under him England was advancing in consequence as one of the powers of Europe, and in civiliza-

tion and improvement in respect of her internal affairs.

What she suffered afterwards from incursions of the piratical nations of the North, she might possibly have escaped had the vigorous rule of Athelstan longer continued. He had no family, and was succeeded by Edmund, his brother.

Athelstan did not labour more to secure his throne and to extend his power and political influence, than to give security and local government to his subjects. He was fond of giving acts of specific and personal kindness to his people. He was a writer of books, and left a code of laws which Athelstan made additions, the principle on which he proceeded being to bring all classes, the ecclesiastics as well as others, within the scope of certain great principles. There are traces in his laws of a noble provision for some of the poorer members of the community of his subjects. He promoted the erection of monasteries, which was in fact at once to provide seats and centres of religious ministration, and places for retirement and security to persons devoted to study. He was the author of the value of books at a time when 'book-ers' as scholars were in those times called, were few. A catalogue of a small collection of books which belonged to him is preserved, and has been printed by Mr. Turner. He encouraged the translation of the Scriptures and other religious books. The monks of the abbey of Bath, even to the time of the Reformation, were accustomed to show to visitors certain manuscripts which they affirmed to be the gifts of King Athelstan. Two very antient manuscripts, which there are in the Abbey, are the oldest works which are preserved among the Cottonian Manuscripts in the British Museum: one of them is supposed to be the very copy of the Gospels on which the Saxons took the oath at their coronation. Athelstan was buried in the abbey of Minster.
work of Athenagoras, was printed at Paris by Daniel Guille- 
lemont: it was entitled "De Vrai et Parfait Amour, écrit en 
Grec, contenant les amours harmoniques de Théogène et Cha- 
rus." 

ATHENE, or ATHENA, the Goddess of Wisdom, of 
Arts, and of Sciences, among the Greeks; known to the 
Romans as Minerva. The Greeks seem to have included 
under this name the most diverse deities of different 
origins—a goddess of Libya, the daughter of Neptune and of 
the nymph Tritonis (Herodot. iv. 180), or of Terra, brought 
forth on the banks of the river Triton in Libya (Diodor. ii. 
4), but the one best known to us is the divinity worshiped 
by the inhabitants of Attica, and that is Athena, known in 
Egypt, at least if we may judge from some of the symbols 
with which her statue was adorned: she had a sphinx on 
her helmet and at her feet. (Plato (Timaeus, , Opusla, vol. ii. 
p. 21) tells us that she was called Neith by the Egyptian 
and Braithes, in his Catalogue of the Kings of Thebes 
(Euseb. Chron. p. 21), says, that 'Nictoria' may be trans- 
lated into Greek by 'Athene Nikephoros.' 

According to Homer she was the daughter of Zeus; but 
there is no allusion in either the Iliad or Odyssey to 
the female of her having sprung forth completely armed 
from the brain of that god: it appears, however, in the 
Hymns to Athene, usually ascribed to Homer. A scholar on 
Apollonius (Argos, iv. 1310) remarks, that this female first 
was worshiped by the inhabitants of Attica; and that 
its origin is the result of this strange union. She seemed 
heavily burdened, and her father had given her to his 
wife, the daughter of Tithonus, and to the gods. In 
her battle with the giants, she overthrew Enceladus with 
the aid of her father; she assisted the building of the 
ship Argo, and a wooden figure of Athene graced the prow 
of the vessel; she assisted Hercules; gave the art of 
prophecy to Tiresias, and immortality to Tydeus, though 
she afterwards deprived him of it. She was one of the three 
gods asked by the people of Athens. The overthrow of 
Paris, and she dispelled with the name of giving 
name to the city of Cercopes. [See Athens, p. 14.] 
The contest was decided in her favour by the production of 
an olive tree, and the city was hence called Athens. (Aphol. 
Bibb. p. 14.) According to Diodorus (f. 12), the Egy- 
pptians gave this name to the Goddess of the Air, and she 
thought to be the daughter of Zeus, because the air is not 
naturally subject to corruption; and was sprung from his 
brother; she was the greatest of all the Graces. 

She was called Gladis (blue-eyed), because the air is of 
a bluish colour. The serpent, the owl, and the cock, were 
sacrificed to her; and, among plants, the olive. She was 
worshipped in all parts of Greece, and the most celebrated 
temple was at Pergamus, which was adorned with the 
most costly ornaments. 

The statues of the goddess, called Palladia, exhibited her 
in very antient times with upraised shield and poised spear, 
ready to engage in battle; sometimes, as symbols of her 
peaceful character, she had in her left hand the spindle and 
DISTAL. A stiffly-folded peplum was thrown over her chiton 
(tunic), and she was armed with an immemorial agnus, which 
sometimes served as a shield, and sometimes was so 
construed as to cover both the breast and back. The outline 
of the body exhibits none of the fulness of woman in the 
arms and breasts, while the form of the bones, arms, and back, 
reminds one of man. But the age of Phidias changed 
considerably the antient characteristic marks of the different 
sexes; and from that time the goddess Athene was 
ubiquitous, a forehead, long and well-formed nose, by the 
swell of the mouth and cheeks, the strongly marked and almost angular chin, the wide-open eyes, and by the hair streaming carelessly over her neck. The effects of the incrustation of the statue of Athena (which 
was still extant); and numerous examples are pointed out by 
Müller in his Archäologie der Kunst, where the subject will be 
found fully treated. A fragment, supposed 

ATHENIEN, a Sicilian slave, one of the principal 
setters in the second Servile war which broke out in Sicily, 
and lasted from the year B.C. 109 to 99. By birth he was a Cilician; he had acquired considerable reputation for 
his military talents in a campaign against the enemy, and 
had been selected by a committee of the Senate to 
command a legion. He was a man of uncommon order, not so much from the short-lived prosperity which he enjoyed, as from the 
unusual tenor of his policy. He filled the station of 
envoy or overseer to two wealthy brothers, and, after the insurrec- 
tion had commenced in other parts of Sicily, began his 
career by gaining over the slaves under his own charge, to 
the number of 200. Other slaves flocked to his standard 
from neighbouring properties, so that within five days his 
followers amounted to 1000 men. He then assumed the title 
of consul, and the state of a new nation, and made all others subject 
by a reflecting mind, well adapted to command. He did not 
freely receive into his ranks all persons who presented 
themselves; but selected for soldiers those who were best 
acquainted with arms, and made all others labour at their 
respective callings: so that he avoided the disorder incident 
to a tumultuary and ill-provided force, and was always 
abundantly supplied with necessaries. He also carefully 
guarded against wanton ravage by a judicious use of his 
prophetic powers; for he had professed to his followers that he was 
destined to reign over Sicily, and that it was wise to pre- 
serve uninjured the land and its produce, as part of their 
own future wealth. He soon collected 10,000 followers, with 
a small army, which he laid siege to Lilybaeum. In this attempt he 
failed; but by the end of the year, 102, he 
increase his power over his followers, by verifying his powers 
of divination. Another slave-leader, named Salivius, who 
attacked his camp, had assumed the name of Athene. Tryphon soon 
that he had received a jealousy for his new associate, whom he im- 
printed; but he was glad to release and restore him to his 
command, when Licinian Lucullus, with an army of 16,000 
or 17,000 men, was sent by the Senate to bring the war 
to an end. The danger caused him to retreat to his 
family. He received the news of the great insur- 

taneous and severely wounded. Lucullus then laid siege 
to Tricomas, in which the insurgents were defeated, and 
and severely wounded. Lucullus then laid siege

and severely wounded. Lucullus then laid siege 
to Tricomas, in which the insurgent
two members to parliament. It is a very old corporation, and is governed by a Portreeve. Its former name was Athroth. It is 117 miles W. by S. of Dublin, and 14 E. of Galway.

There are three fairs in the year. The church is in good repair. The London Hibernian Society and the Kildare Place Society unite with the incumbent in the support of a free school, in which about forty children boys and girls are educated. The population of the town in 1823 was 1693: that of the whole parish, 12,500. This last statement includes the population of the chapelry of Montrose; in which are a chapel of ease and several free schools, including a charter school, and two schools connected with the Kildare Place Society. The living is a consolidated rectory and vicarage, in the diocese and county of Tyrone.

There was a Dominican friary in Athboy, which was burnt in the year 1432. The remains show it to have been a fine building; the great east window is bold, and of good workmanship. Part of the ruins have been taken down to erect barracks. A Franciscan friary was also founded here in 1464.

This town gives name to one of the baronies of the county. (Parliamentary Papers: Seward's Topog. Hibernia.)

ATHENS, or ATHENAS (Ἀθῆνα), the chief city of Attica, one of the ancient political divisions of Greece.

We propose in the following to give a brief description of the topography of the city, referring to Attica for the geographical description of the province; and next, a brief outline of its political and literary history, referring to the proper articles for the minutest detail.

Athens is situated about five miles from the sea-coast, 27° 50' N. lat., 23° 43' E. long., occupying part of the central plain of Attica, and some heights which run down into the plain, but are quite detached from the mountains on the north frontier of the province. Of these eminences, the most conspicuous are Mount Anconemus (now St. George) with its peak summary rising higher than the Acropolis, on the north east of the city; and beyond the ancient walls, the Acropolis, which was entirely included within the old walls; the Aeropagus, opposite to the west end of the Acropolis; and the hill of the Museum, partly included within the ancient walls, the highest eminence on the south. On the east side of the city, the little river Iliusus, which rises a few miles north east of Ambolókipo, runs in a south west direction past the city, separating the heights of Athens on the west, from the higher and more continuous range of Hyetussus on the east; it joined a little above the site of the Lyceum by the Eridanus from the east. This little river, which in its natural state might have reached the marshy lands near the coast, is now reduced by the heat of summer and the channels for artificial irrigation to an inconsiderable stream; and in ancient times its current must have been diminished from the same cause. The Cephissus, which runs due south past the west side of the city, at the distance of about a mile and a half from the walls, is also near the walls from the Pericorm is by N. by compass, as near the walls from observation of their existing foundations. The southern wall, which ran from the city to the Phenereum, was called the Phenereic wall; the northern, which ran from the Phenereic Gate to the Phenereum, and was a double wall, was sometimes called the Long Walls and sometimes the Phenereic Wall. (See the plan annexed to the

---

[Plan of Athens, from the authorities of Col. Leake and Mr. Cockerell]

---

[Plan of Athens, from the authorities of Col. Leake and Mr. Cockerell]
map of Attica.) That part of the city walls included between the two points where the Phaleric and Peiraiac walls respectively said on them is not included by Thucydides (i. 13) in his estimate of the extent of the city walls which required defence; and we must, in like manner, deduct from the circuit of the city the Peiraeus and the Munychia. We are on the land side between the western extremities of the Phaleric and the Peiraiac walls. The circumference of the city, then, according to Thucydides, in B.C. 431, was—**Sndia
The City, deducting the part between the Peiraiac and Phaleric Walls**

**43**
The Phaleric Wall

**38**
The Peiraeus Wall

**564**
The Maritime City, deducting the space between the Phaleric and Peiraiac Wall

1744

This will give a total circuit of about nineteen or twenty miles. (See Lassie's Topography of Athens, p. 368.)

The chief Gates of Athens, as far as their position can be with any probability determined, are indicated in the plan. The cemeteries of the city surrounded it on every side, but were reserved chiefly for the Athenians, having been determined as they commenced immediately on the outside of the walls. The road from Dypplum to the Academy was lined with the tombs of illustrious men, such as Pericles, Thrasylalus, Chares, and Phidias. Here too were the monuments erected to the memory of those who served as **poliarchs**; a slab of stone, with the name and township (θυγας) of each individual, was the honour paid by the state to its citizens who died in battle. (Pausanias, i. 29.) The Academy itself was surrounded with a wall, planted with trees, and ornamented with fountains of water. Near it was the tomb of Plato.

The tomb on the east side of the city were separated from it by the Gardens (Kýrēs), the Lyceum, and the City Gate which is now Port Baccho. It is said that if we approach too near it, it is dangerous. The wall which surrounded the city was strengthened at intervals with towers; there were also square towers on the long walls which connected the city with the ports. These walls (the Peiraeus and Phaleron) were about four miles in length, and at a distance of 250 feet from one another; when the city was in its highest state of prosperity, the open space between them contained a considerable number of houses, which formed a kind of intermediate town between the Astr, or Upper City, and the Permeus.

The three ports of Athens, going from west to east, were the Permeus, now Port Dthrakio, which contained three natural bays: the Munychia, now Stratotiki, separated from the Permeus by the round projecting and hilly peninsula of Munychia. It has been decided that these three parts, with the buildings attached to them, once formed a separate city larger than Athens itself. A sea wall, sixty Greek feet high, and constructed of wrought stone, extended from the bay of Phaleron all round the rocky peninsula of Munychia, terminated by Cape Alkinos; the north-west and east side of the Permeus was also inclosed by a wall running down to the sea; a wall ran from the Phaleron across the high ground to the head of the middle bay of the Permeus, and a third wall ran across the narrow isthmus of the Munychia. The importance and strength of the fortifications of the maritime city, and especially of the Munychia, appear from the siege of this place by Demetrios Poliorcetes, and by Sulla; the possession of which was a matter of much moment to the Permeus. The Permeus was the great dock-yard of the Athenians, and the chief harbour for the vessels engaged in the corn and other foreign trade. It contained large warehouses, public arsenals, the armoury of Ptolemy, several temples, a theatre, and many houses with porticoes and arcades (παράκλημα καλαμάς) analogous to the bazaars of Eastern cities, which probably contained the Deigma (a place for the exhibition of samples of goods), and Pheiae (a court of market). Among these are the Peiraeus and other buildings. The most remarkable of the Peiraeus, nothing now remains but some traces of foundations and broken pieces of sculptured marble. The port, though its entrance is very narrow, is still a safe one: the ground inside is very good, and rather to the southward of the centre a ship may drop her anchor in about seven fathoms still water, and move with open hearts towards any part of the compass, for she will ride so secure that neither wind nor sea can hurt her." (Capt. W. H. Smyth.) The peninsula of the Munychia contains the foundation of a temple, the remains of a small theatre, and clear indications that it was extensively built upon. Nothing remains of the buildings which once adorned the Phaleron. This line, however, of the extensive system of walls which defended the maritime demi, or town, can still be traced in most parts; and in the Munychia, on the side towards the sea, courses of masonry, both of walls and towers, still exist, formed in some parts of large squared stones cramped with iron. (Thucyd. i. 93.)

We shall endeavour briefly to describe those localities in ancient Athens which seem at present to be pretty well identified. It appears probable that even in its best days the first appearance of Athens was not very pleasing, and that its attractions were mainly due to the picturesque beauty of the wanderer of the latter part of the century (B.C. Deme- arcus, Hud. Min. Geog. vol. ii.) describes the city as dusty, and badly supplied with water, and the streets did lay out, a fault which he attributes to the great extent of the place. Most of the houses were mean, and only a few good. 'A stranger, on the first view,' he adds, 'might doubt if this is Athens; but after a short time he would see that it was.'

The most striking object is the Acropolis, or Citadel, a rocky range which rises abruptly from the plain, and covered by the Parthenon. Opposite to the west end of the Acropolis, and separated from it by a depression, is the Acropege, or Hill of Mars, on the eastern and highest extremity of which was the altar of the Aretopous. See [Arcophagi].

Adjacent to this hill was a place on which the public meetings were held in the more antient period of the state, and where a bema, or pulpit of stone, still marks the place from which the assembly was addressed. (Ov. Fast. iv. 899.) Compare Lassie, p. 42, and art. ATTICA. Erch. and Gruber.

North of the Acropolis is the Temple of Theseus, built of Pentelic marble, one of the best-preserved buildings of ancient Athens. At first sight it appears so entire as to make us wonder if it was not originally intended to be erected about B.C. 470-465. It is a Doric temple of moderate dimensions; a peripteral hexastyle, with thirteen columns on each front. The eastern pediment was adorned with sculptures, as well as the ten metopes of this front, and on the four adjacent sides of the whole front. All these metopes, which appear to refer to the exploits of Theseus and Hercules, and also of the frieze, are in the Elgin Room of the British Museum. (See TURMUS, and Stuurt's Athens, vol. ii.)

Near the east of the Temple of Theseus are the remains of what is probably the Stoai or Portico of Hadrian, one of the monuments with which this munificent emperor embellished the city of Athens. It is not exact to state, Ninth and Archeological, the year it was erected. The west colonnade of this building corresponds to that of the Arch of Hadrian; still it seems most likely that these remains are part of the great work of that emperor, described by Pausanias (i. 10), who informs us that the Stoai of Hadrian was adorned with a hundred and twenty columns of Phrygian marble, and contained apartments whose roofs were 'gilded and made of alabaster:' it contained also a library, and the apartments were decorated with statues and paintings. The Gymnasium of Hadrian was probably near the Stoai; and the Gymnasion of Polyeuma between the Stoai and the Temple of Theseus. South of the Stoai is the Tower of the Winds, called also the Tower of Andronicus Cerebes. See [ARCONIDUS]; and Stuart, vol. i. p. 42.) The Gate of the Peiraeus, now New Agora, was once the place of the Great Stoai and the Tower, still exists: it is a portico of four fluted Doric columns, of Pentelic marble, supporting an entablature and pediment. See the view and plans in Stuart, vol. i.)

The south-east quarter of the city, which is entered by the Arch of Hadrian, was one of the oldest parts of it, next to the Acropolis. This building of Pentelic marble, consists of a circular arch with Corinthian columns, the capital of each supporting one or more columns of Corinthian columns, surmounted by an entablature, with a pediment in the centre. (See Stuart, iii. 90.) An inscription upon the frieze on the south-east side of the arch still testifies that the emperor gave his name to the part of the city formerly on the site of the Acropolis, and that he stood the magnificent temple of Jupiter Olympus, which being re-commenced about B.C. 176-165, on the site of an
older temple, and worked upon at intervals, was at length finished by the liberality of Hadrian. Sixteen columns of Pentelic marble, 60 feet high, and above 6 feet in diameter, are all that now remain of the 138 which once adorned this magnificent building, one of the largest erected by the Greeks in honour of their deities. (See Stuart, ii. p. 83.) This temple and its sacred enclosure were filled with statues: two of the emperor were made of stone from Thasos, and two others of stone from Egypt; the statue of the deity was a chryselephantine (gold and ivory) statue of colossal size.

The fountain called Callirrhoa, or Kanassaerus (the nine springs), the only source of fresh water in the neighbourhood, was only a short distance from the south-east angle of the great temple. There were wells, as Pausanias remarks (i. 14), all through the city, but this was the only source of pure water. An aqueduct from Cephissus on the Cephissus was constructed for the use of the city by Hadrian and Antoninus his successor. The reservoir of water was made at the foot of Acheanemos, and adorned with a frontispiece of four Ionic columns. (See Stuart, iii. 94.) This monument, of which two columns were standing in 1764, is now destroyed.

The quarter called Hadrian's City, on the east side of the Ilissus, is the Panathenaeic Stadium, first constructed by Lycurgus the orator, B.C. 338, and adorned with Pentelic marble by Herodes Atticus, in the reign of Hadrian. All the marble has disappeared; but part of the masonry at the south-east or circular end, and the coves, or part destined for the exhibition of the Panathenaeic games, remains. Its length in the interior is 675 feet.

On the hill of the Museum, which is separated from the Acropolis by a depression, we find the monument of the Syrian mentioned by Pausanias (i. 85). According to the inscriptions it was erected by Phileoppus, or in honour of Phileoppus, the son of Epaphanes, in the reign of Trajan; it contained three niches, two of which remain, in which were placed the statue of Phileoppus himself, occupying the centre, his grandfather Antiochus the last king of Commagene, and that of Seleucus Nicator, the founder of the dynasty of the Seleucids. (See Spon, i. 157. Amst. ed.; Dodwell's Travels, i. 392; and the view in Stuart, ii. 99.)

We have now noticed the chief existing monuments of Athens in the lower part of the city, with the exception of the small choragic monument of Lysicrates, erected about a. c. 334 (the year of Alexander's expedition into Asia), vulgarly called the Lantern of Demosthenes: it stands between the south-east angle of the Acropolis and the great Temple of Jupiter, and is or was partly built up in the buildings of the Capuchin convent. This little edifice, which consists of a circular colonnade of Corinthian columns, resting on a high quadrangular basement, is only six feet in diameter, on the central piece, which rises from the cupola that crowns the colonnade, a tripod originally stood.

Of the great divisions of Athens which appear to be ascertained, we may mention the Inner Cerameicus, adjacent to the Dipylon, within the walls; the Old Agora, in the depression about the Areopagus; the New Agora, on the north side of the Acropolis, the gateway of which, as already observed, and three inscriptions still remain; and Eumenes, or Marshes, a low and originally a swampy part of Athens, which contained the Lunateum, or Temple of Bacchus. This last quarter of Athens was always considered inferior in salubrity to that northerly part of the Acropolis.

The Acropolis, or the old Cecropian fortress of Athens, is a rock, which rises abruptly from the plain, with its sides naturally scarped, except at the west end; its greatest length may be about 1200, and its greatest breadth about 550 feet. Before we describe briefly the edifices which stand on the platform of the Acropolis, we must notice those which stood immediately around its base.

Along the base, on the east side, extending southwards from the supposed site of the Prytaneum, probably ran the street to which Pausanias gave the name of Tripods (i. 29). This street, or quarter, was so called from a number of small temples or edifices crowned with tripods, to commemorate the victories gained by the Choragi in the neighbouring theatre. The great Dionysiac Theatre, the place for dramatic exhibitions, was on the south-east side of the Acropolis; the inner curve was excavated in the rock, and the part which projected into the plain was formed of masonry. In the recess of this excavation, and above the theatre, Pausanias (i. 31) describes a cavern, which was converted by Thrasyllus (A.D. 39), a victorious choragus, into a small temple. A noble seated figure, of colossal size, now generally called the statue of Bacchus, which originally was placed on the entablature of the small temple, is in the Elgin Room (No. 111) in the British Museum. (See article ARK; and the plate in Stuart, ii. 94.) A brass coin of Athens, in the British Museum, represents the interior of the theatre, showing distinctly the seats for the spectators, with the caves (for there are more than one) just under the cliff of the Acropolis; rising above which we observe the Parthenon, and other buildings which stand on the platform of the rock.

The dimensions of this theatre cannot now be ascertained, but we may safely infer it was a very large one. Demar- chus expresses his admiration of its beauty.

On the south-west side of the Acropolis is the site of the
Odeum, or Musical Theatre of Herodes Atticus, named by him the Theatre of Regilla, in memory of his deceased wife. This splendid monument of the munificence of a private individual was erected in the second century A.D., and was the finest building of the kind in Greece.

The grotto of Apollo and Pan, with the little spring, described by Pausanias (i. 28) as close to the Propylaea, is at the north-west angle of the Acropolis, and near some steps which led up to the Acropolis from the northern side of the city, as appears by the following coin from the British Museum, in which the Parthenon is apparently indicated.

At the west end of the Acropolis, where alone the approach is practicable, the open space was filled up with the Propylaea, a magnificent work of Pentelic marble, which served both as an approach and a military defence to the citadel. The front or central part, which was flanked by two projecting wings, consisted of six fluted Doric columns, about 29 feet high, supporting a pediment, and approached by four steps. A vestibule, formed by six Ionic columns, placed in a double row and parallel to one another, stood behind this portico, and led to five openings or doors, of which that in the centre was the widest. The roof or ceiling of this vestibule rested on triple lengths of marble beams laid across the west entrance: the beams belonging to the two side-sides rested respectively on a lateral wall, and the architrave of the nearest row of columns: these beams were about 22 feet long. These lying across the central passageways about 17 feet long. On these beams rested the slabs of the ceiling, which was decorated with various ornaments. The five openings led by steps, into a portico which flanked the platform of the Acropolis, and had a front and pediment similar to that at the western entrance of the Propylaea. This beautiful work has suffered grievously since the occupation of Athens by the Turks. A great part of the eastern side of the Propylaea was destroyed, about 1856, by an explosion of gunpowder (Spon, ii. 107), that took place in the part between the five doors and the west front, which had been fitted into a powder-magazine. Spon (ii. 164) describes the west front, with its pediment and the Ionic columns of the vestibule, as existing in 1675; but the upper part of the west front is now entirely gone. [See Stuart, iii. 104; and Pasoplinos.]

The chief ornament of the Acropolis was the Parthenon (erected about B.C. 450-440), or Temple of the Virgin Goddess Minerva, which stood on the highest level of the Acropolis, and was built of the hard white marble of Pentelicus. This noble monument of ancient art is now greatly damaged, though a few centuries ago it was probably in a state little worse than it had been for two thousand years before. It suffered from the ravages of war between the Turks and Venetians, and also more recently in our own time. The columns and the sculptures which decorated the pediments, with many of the metopes and a large part of the frieze, are now in the Elgin collection of the British Museum. These sculptures form an epoch in ancient art, and, together with the temple to which they belonged, will be the subject of a separate article. [See PARTHENON.]

The position of this temple is indicated in the plan of the Acropolis; it is at 37° 36' 50" N. lat.; 23° 49' 31" E. long. (Captain W. H. Smyth.)

Of the other remains on the Acropolis, the most interesting is the building, which, consisting of various parts, is now commonly known by the general name of the Erechtheum. The site of this edifice is denoted in the plan; its details require to be treated separately. [See ERECHTHEUM.]

The south portico of the Pandroseum (which is a part of this edifice), instead of pillars, was supported by six female figures, about seven feet high, technically called Caryatides, one of which is now in the Elgin collection; and another had disappeared even when Stuart and Revett visited Athens in 1750.

Besides these, and other smaller edifices which adorned the Acropolis, it contained a prodigious number of statues and other works of art—some of colossal size, and others distinguished for their exquisite beauty. The bronze colossal statue of Minerva the Defender (Ἀθηνᾶς Ἐρυθρώτης), the work of Phidas, is probably the statue represented on the coin which shows the steps of the Acropolis. The spear and helmet of this colossal figure (Pausan. i. 28) were visible towering above the Acropolis to those who approached Athens by sea, as soon as they had rounded Cape Sunium.

The Propylaea formed the western entrance of the Acropolis; the rest was surrounded by a strong wall. That on the north side was called the Pelasgicom, a term also applied to that part of the city immediately below it, and by Herodotus (v. 64) to the whole Acropolis. According to tradition, the north wall was built by the Pelasgi; possibly the existing wall may be part of this original construction, which, in all probability, is the oldest existing monument of Athens. The south wall was built, or probably rebuilt, and strengthened by Cimon, the son of Miltiades, from which it took the name of Cimon's wall; in some parts it is sixty feet high. Near this south wall, as Pausanias tells us (i. 25), was the representation of the wars of the giants, the battle between the Athenians and the Amazons, the battle of Marathon, and the defeat of the Gauls in Mysia by king Attalus I. [See ATTALUS.]

At the close of the late Greek war, Athens was in a dreadfully state, being little more than a heap of ruins, and almost without inhabitants. At present, building is going on in the north part of the city, and if the unfortunate country of Greece can enjoy security, we may hope that, in a few years, the town will be in a more flourishing condition than it has been for many centuries. The excavations that are made for the purpose of erecting new buildings will probably determine some sites hitherto uncertain, and bring to light some valuable monuments of the best ages.

The authorities which may be consulted for the topography of Athens are very numerous: Strabo, book ii.; Pausanias, book i.; with the scattered passages of other Greek and Latin writers; Spon and Wheler; Chandler's Travels, of which there is a French translation, with notes, by B. d'Outre; Stuart's Athens, 4 vols. folio, republished by Friensley and Wesley, London, 1827; Leahy's Topography of Athens; Wilkins's Atheniense; and Elgin Marbles, 2 vols. 12mo., published by the Society for the Diffusion of Useful Knowledge, in which these and other authorities are more particularly referred to; see also Encyc. of Erch and Gruber, art. ATHENES A.D. 1821.

History of Athens.—The origin of civil communities is generally unknown, and that of Athens does not form an exception to the remark. Our object here will be to give a brief sketch of the history of this state, referring to the particular heads for a more detailed account of the most important periods and events.
The first period of Athenian history, ending with the war of Troy, is of a mythical character. Aegeus (Pausan. i. 2.) was the first king of Athens. Cocus, according to one fable, was a native of Athens, who married the Daughter of Athene. According to another fable, Cocus was an Egyptian, who brought from Egypt the arts of social life, and laid the foundations of the religious and political system of the Athenians. The name of Cocus, whatever it may have been, among the Athenians to the latest epoch of their existence as a people. Of the successors of Cocus, Erechtheus the first, otherwise called Erechtheus, was of divine or unknown descent; his name also survived and retained a place in the religious observances of Athens. In the reign of Pandion, the son of Erechtheus, Demeter (Ceres) was wandering on earth in quest of her lost daughter; out of gratitude for information about her child, the goddess taught Triptolemus of Eleusis the art of agriculture, and the Athenian plain was paved with a harvest anither unknown to man. A second Erechtheus fought with the Eleusins of Eleusis, and lost his life. Theseus, the son of a Pandion, in course of time came to the throne, and his son Theseus was the last, so he was the greatest of the Athenian heroes. Theseus was the friend of Hercules and Perithous; and the venerable Nestor, who assisted the Greeks with his counsels at the war of Troy, had fought, when a young man, in the same ranks with Theseus. When Theseus was at the time of the Athenians, he was persecuted by his martial exploits against the bull of Marathon; by his descent to the infernal regions; his voyage to Crete, and his combat with the Centaurs. As the reputed founder of the Athenian polity, who united in one confederacy the several states or petty kingdoms of Attica, established by Cocus (Strabo p. 397), he appears to be invested with the character of an historical personage. (See Thucyd. i. 13.) Theseus is also said to have instituted the great festival of the Panathenaea, in commemoration of the political union of all Attica. (Pausan. viii. 2.) To the latest period of their history the Athenians retained the grateful remembrance of this hero, and the beautiful temple, which is still called the Theseum, has preserved to this day a fragment of a marbled statue of Theseus, period when the truth of history is wrapped in the impenetrable veil of the myth of the Greeks.

The Athenians sent fifty ships to the war of Troy, under the command of Menestheus, who had driven Theseus from Athens; but neither the general nor his soldiers occupy a conspicuous place among the worthies of Homer. If we endeavour to trace the history of the Athenian people, we find the obscurity of their origin expressed by the fact that they were driven from the land which they inhabited. Herodotus (v. 57) says that the Athenians were originally Pelasgians, and that they became changed into Hellenes (Greeks). Such a change implies the conquest of the country by one race while it was still in primitive condition, of another; the amalgamation of the conquered and the conquering races, or the extinction of those who were compelled to yield. The former we believe to be supported by more probabilities. Xuthus, the son of Hellen, married a daughter of the second Erechtheus, and was the father of Athene and Ion; thus the name Ionian became attached to the Attic soil; and we have the historical fact, that the names of the four tribes which existed till the time of Erechtheus were derived from the names of four sons of Ion. (Herd. v. 66; Pausan. vi. 1.) The Athenians, says Herodotus (v. 44), in the course of occupation by the Pelasgians of the country now called Athens, were Pelasgians, with the distinctive name of Cratus. From Cocus they received the name of Coccus, and upon Erechtheus succeeding to the royal power, their name was changed to Athens. After Ion, the son of Xuthus, had become the leader of the forces of the Athenians, the people got the name of Ionian. In the fable of Poseidon and Athens (Neptune and Minerva) for the possession of the sacred island of Athens, Poseidon, the god of the Ionians of Helle and the national god of those who were afterwards the Ionians of Asia, contested, though unsuccessfully, against Athens, the primary possession of the sacred island and the worship of Poseidon was not neglected in Athens: the Erechtheions preserved the remembrance of the contest, and the altar which it was usual to sacrifice (Pausan. i. 26) both to Erechtheus and Poseidon, indicated that the mythical king was the representative of the deity whose worship strove for the supremacy. Among the various names by which Athens was known, we find that of Poseidon, or the City of Neptune (Strabo p. 397); the same name itself was given to eight different places. (See Stroh, Byzant. 425.)

The fable of the two deities contending for Attica is represented on a coin of Athens.

The remembrance of the Pelasgians was retained in the name of the northern wall of the Acropolis, of which they were the architects, and in that part of the city which was below it in the plain. Tradition, however, reported that the Pelasgians, or that portion of the old inhabitants, of which did not concur with the new comers, were finally driven out of Attica, and retired to Lemnos. The connexion between the Lemnians and Thracian Pelasgians and the Athenians seems sufficiently indicated by old traditions and other circumstances. The Pelasgians who were in Attica in the time assigned to the reign of Cocus; and it has been remarked (Erich and Gruter, Ench. Attic) that the analogy of the name Pallus to the Thracian peninsula Pallene, and of the mountain Athos to the name Athenes, appears to indicate the Thracian origin of these Athenian denominations.

The line of Athenian kings, whatever may have been its historical commencement, terminated with Codrus, son of the Messenian Melanthus. Melanthus, himself a fugitive, had received the Ionians, who fled from the Peloponnesus before the victorious Heracles (a. c. 1101), partly, as it is said, for the sake of Ion, that is, because they were kinmen, and partly because the Athenians wished to strengthen themselves against the Dorians. On the death of Codrus, a full year elapsed before a new king was elected, and it was the time assigned to the reign of Cocus; and it has been remarked (Erich and Gruter, Ench. Attic) that the analogy of the name Pallus to the Thracian peninsula Pallene, and of the mountain Athos to the name Athenes, appears to indicate the Thracian origin of these Athenian denominations.

Egypt, which country he is said to have visited; of Creusa, king of Lybia, whom he married and ruled; and of Thrandus, the founder of the Persian empire. With the legislation of Solon (c. 594), Athenian history begins to assume a more definite form, and the same epoch marks the historical commencement of that series of events which brought about the rise of the Athenian state, and its connexion with the south of Europe. Tradition assigned to Theseus the credit of laying the foundation of their democracy. (Plut. Them. 25.) Of the regulations (tetrarchies) of Draco (c. 628), the predecessor of Solon in legislation, we know but little. The Peloponnesian war necessitated several modifications of these, which require an almost entire change. [See DRACON.] The constitution of Solon was designed to maintain the chief political power just where it was—in the hands of the rich, whom he did not affect to regard; but to give more power to the people, and to them alone he gave the privilege of filling public offices; but by allowing the fourth or poorest class to be members of the ecclesia, and to be the dekoi or jurymen in the courts of justice, he laid, perhaps unintentionally, the foundation of a pure democracy. Besides the nine Archons, the administration was managed by the senate (boule) of 400, each of the four tribes supplying 100 members. [See ARKOPAGUS, SOLON.] The usurpation of Pisistratus (c. 540), who by fraud and force seated on the supreme executive power, was followed by a system of laws; but it certainly must have changed, for the time at least, a great part of the constitutional forms of Athens. Under the title of tyrant (tyrannos), a term at that time not necessarily implying vice or ignominy, Tyrannus was elevated to the seat of power. He was twice expelled from Athens, but a battle on the field of Marathon at last secured his power, which he transmitted to his son Hippias. [See PISISTRATUS.] His successor had neither the ability nor the disposition to follow in the footsteps of his father. Tyrannus, who was banished, lived out of Athens (c. 510) by the aristocratic faction of the Alcmeonids, who, by corrupting the oracle of Delphi, brought against Hippias the power of Lacedaemon. Cleomenes, the head of the Lacedaemonians, was appointed in Athens, a young man on this business. Hippias being expelled retired with his family to Elisium on the Hellespont, a possession which had been acquired by the arms of his father. Pisistratus and his son held the tyranny of Athens for thirty-six years (Hercod. v. 63), during which time we may reasonably infer that all tendency towards a democratical form of government was suppressed: but the arts began to flourish under their rule, and the foundation of the temples of Apollo Pythius and Jupiter Olympius was assigned to the period of their government. The downfall of this antient (seen Hercod. v. 63) and powerful family was the signal for the commencement of party strife, and for the consequent development of the democratical principles.

Two factions now divided Athens, headed respectively by Clearchus of the family of the Alcmeonides, and Isagoras, the son of Tandar. [See CLEARCHUS.] Clearchus changed the number of the tribes (eisai) from four to ten, and by this extraordinary act he made himself the most pre-eminent of the Athenians. The senate (boule) of 400 was changed into 500, fifty members being annually chosen from each tribe. His rival called in to his aid Cleomenes, who, though at first successful, was finally baffled in his attempts on Athens. This invasion of Cleomenes is worthy of notice, for having led to the first recorded communication between the Athenians and Persians. The Athenians, wishing to strengthen themselves against another threatened invasion, sent ambassadors to Artaphernes, the Persian governor of Sardis, to offer all the tribute; after which the Athenians were, and where they lived, promised help on condition of their giving to the king of Persia earth and water, the usual signs of submission required by the great king. The ambassadors intrusted it to the Persians, and, on their return home, were well abused for their pains.

The issue of the Spartan attack, which was so much apprehended by the Athenians, was more favourable than they had anticipated: the Corinthians, who had joined in the attack on Athens, retired. Under the direction of two Lacedaemonian kings, Cleomenes and his colleague Demaratus, quarrilled at Eleusis just before a battle was expected, and the Peloponnesian army consequently dispersed; and the Athenians were thus left at liberty to dictate terms. The Athenians, however, had gone to a concert with the Peloponnesians, had crossed the frontier. The Athenians gained a complete victory over the Boeotians and Chalcidian, crossed into Euboea, and laid waste four thousand Athenian colonies in the territory of Chalcis. The Persian king, hearing of this, sent to Artaphernes, on the invasion of the Lacedaemonians, and urged his claims to be restored to the sovereignty of Athens. Though supported by the leading state of Peloponnesus, Hipippus failed in obtaining consent of the rest of the allies, and the Athenians, soon afterwards, made an expedition to occupation of Sardis, from where he endeavored to maintain his desperate cause by exciting Artaphernes against the Athenians. An event soon happened which was favourable to his views. The Athenians, under the command of Artaphernes, in twenty ships, to which the Eretrians of Euboea added five, were opposed by the Ionian Greeks, who had revolted against Darius. The confederate forces succeeded in burning Sardis, which was the immediate cause of the invasion of Greece. An immense armament, under the command of Datis and Artaphernes, crossed the Aegean, besieged and took Eretia in Euboea, and landed on the opposite coast of Attica. The aged exile Hipippus led the Persians to the plain of Marathon, the scene of his father's victory, a spot well adapted for the operations of his army. The Athenians, supported only by the Platans, under the command of Miltiades, defeated the formidable army of the invaders (c. 490), which retreated in ships to the coast of Darius, which was the battle of Marathon.

Ten years later, Xerxes, the son of Darius, led in person against Greece one of the largest forces of which we have any trustworthy record. The army, accompanied by the fleet which attended its movements along the coast, advanced through Thessaly, took possession of the pass of Thermopylae, where the gallantry of Leonidas for a short time opposed its progress. The treachery of the Boeotians, and the cowardice, or lukewarmness of the Peloponnesians, allowed the Persian army to march unopposed through Boeotia into Attica, while the fleet followed the coast and took its station near Salamis. The Athenians were compelled to leave their city to the invaders, and embark on board their fleet. Fortunately for them in this contingency, they had already a considerable naval force, which, at the advice of Themistocles they had raised for the purpose of contending with their troublesome neighbours in the island of Eginia. In the sea fight of Salamis (c. 480), the Persian fleet was entirely ruined by the combined naval force of the Athenians and the other Greeks, and the Persian king made an inglorious and hasty retreat into Asia, leaving behind him Mardonius with about 300,000 men. Mardonius, having entered Athens a second time and making a further attempt to detach the Athenians from the alliance, burnt and destroyed all that Xerxes had left untouched, and reduced Athens almost to a heap of ruins. In the year after the battle of Salamis the Athenians completed their new fleet, and Plataea, by the combined Grecian forces under the command of Pausanias the Lacedaemonian. [See XERXES, SALAMIS, and PLATEA.]
to the orator and the successful commander, in whose person from this time forward, and indeed probably from a still earlier period, was centered the real executive power. [See Aristides.]

After the battles of Platae and Mycale, and the capture of Sestos, Athens was still thought desirable among the confederate Greeks to prosecute the war against Persia. The Lacedaemonians, hitherto considered the head of the confederation, were little disposed for foreign service, and Psammetichus, their commander on the Hellespont, was detached, after giving battle, by the influence of his allies by self-interest and tyrannical behaviour. The lead was thus transferred to the Athenians (c. 477), who in a short time contrived to turn this to their own profit. A certain quota or rating of men and ships was exacted from all the states of the confederacy in order to provide a common fleet, about the command of which all the states of the confederacy were equally interested, and from which the Athenians obtained the use of a large share of the public money, with which the Athenians formed and maintained a force by which they ultimately reduced many (who were hitherto allies) to the condition of dependent and tributary states.

Thus arose the Athenian naval supremacy, which for a time gave them a more extensive empire than any Grecian state ever acquired, till the time of Philip and his son Alexander. The efforts and the success of this little state till the thirty years' truce (c. 445) were truly surprising. Cimon, the son of Miltiades, took Elizon on the Strymon, decisively defeated the Persians (c. 465) in a great battle on the Eury- meon in Pamphylia, took Nazo, and took and burned the Athenian fleet at Aegina (c. 450). [See Cimon.] For six years (c. 460-455) the Athenians aided the Egyptians in their rising against the Persians, in the reign of Amasis. They got possession of a large part of Memphis in 456 B.C. and a smaller part of Egypt, in 454 B.C., and were at one time acknowledged as virtual masters of the country. Their final defeat was apparently owing to the want of a vigorous commander, and partly, no doubt, to the want of supplies, which Athens could ill afford to send so far a distance, while constantly engaged in war with her immediate neighbours. Under the command of Tolmides and Pericles, the Athenian empire at home had acquired a very considerable increase of strength by the success of their arms. The extent of their power is not known, but it is thought to have been something like that which Athens held during the thirty years' truce. Athens surrendered the province of Aegina, Naxos, and Megara; the two ports of Maroneia, and Trozen; all of them important positions in the Peloponnesus. But their empire in more remote parts had received considerable assurances before the commencement of the Peloponnesian war. Amphipolis on the Strymon had been successfully planted as an Athenian colony; Potidaea, on the isthmus of Parnassa, had fallen into their hands; numerous islands in the Adriatic had been subdued by them. The capture of Eretria, the key of the Euxine, was in their possession, and gave them the command of the supplies of grain from the northern shores of that sea.

The wealth which both the state and individuals acquired during this period, led to the extension and embellishment of Athens. Cimon built that temple of Theseus which still exists, and embellished the Academy and the Agora. During the time of his greatest influence, probably after the battle of Eurymedon, the Long Walls were built. Next to Thucydides and Cimon in order of time, and before them as the beautifier of his native city, we must place Pericles, the son of Xanthippus. Under him were built the Parthenon, the Propylaea of the Acropolis, and the temple of Minerva at Aegina, the Hellespont, Pera, Chalcis, Ithica, and Phidias, executed the noble plans of the orator, statesman, and warrior, who now wielded the power of the democracy; and from the united efforts of the architecs and sculptors they produced the masterpieces which the world has ever seen. [See Pericles.] Athens, which hitherto does not appear to have had any pre-eminence in the imitative arts, was now adorned with public edifices, in which architecture and its sister sculpture, with painting, co-operated. The public edifices by the masterpieces of these three by far transcended any as yet humanized the citize. Nor must we omit to notice the progress which the dramatic art made during this period. Tragedy, if not indigenous in Athens, which however seems to be the probable source of its most complete development, received its first important stimulus from Solon, and possibly from Cleopatra, and was vouchsafed its prime of glory by the introduction of a moral and philosophical character. The great Dionysiac theatre, which was probably commenced early enough to witness the tragedies of Aeschylus, was formed expressly for the exhibition of the drama. Comedy also, said to be of Sicilian origin (but perhaps rather of Greek Magna Grecia), came to Athens in the time of Aeschylus, Aristophanes, and others of the old comedy, while they tried to amuse the people and secure the honours of the prize, often made its pieces the vehicles of political opinions, of personal satire, of moral and philosophical forms of the occasion in its rise, decline, and abuse. Besides the drama, history, philosophy, and science, though they may not have been of Attic origin, took root during this period, and became almost her exclusive property. The development of the mathematical and physical sciences, and the rise of women's education, when the great philosophers, and hardly forms a part of the literary history of Athens.

The Peloponnesian war, which commenced c. 431, forms an important period in Athenian history, and requires a separate consideration. [See Peloponnesian War.] Athens commenced the contest with all the advantages of long experience in warfare, a powerful navy, a large revenue, and numerous subject or allied states. Sparta, at the head of the Peloponnesian confederation, and the most powerful military state in Greece, was urged, both by national hatred and by fear of future danger, to attempt to crush the increasing power of her rival. The war, in its origin, and still more in its progress, was a war both of political and military ambitions: the Dorians, with Sparta at their head, the latter supported by the allies of the Athenians, and the Ionian Greeks against the Athenians, the head of the Ionian nation, and the great advocates of democratic forms. In the second year of the war Athens suffered from a dreadful pestilence, which overtook the city and the neighbour States. After the death of Themistocles by Thucydides (lib. ii.), with the minuteness of an eye-witness and the spirit of a true philosopher. The great expedition to Sicily, undertaken (c. 415) in the wildest spurt of popular miscalculation, tended to bring the war to a terminus. The death of Archidamus also, and the falling out of the Thracians and the Cimmerians, long after the Athenians than their enemies anticipated. The death of the Athenians by Lysander at Aegospotami on the Hellespont, prepared the way for the blockade of the Hellespont by the Lacedaemonians. On the 14th of June, 405 B.C., the Persian and the Lacedaemonian states, in a battle near Aegospotami, were defeated, and the Athenians, whose surrender was hastened by the extremities of famine, even consented to give up all their ships except twelve; to consider the same people their friends and enemies who were the friends and enemies of the Lacedaemonians; and to follow the Lacedaemonians by sea and by land, wherever they might choose to lead, (Xen. Hel. 8. 1.)

Athens, chiefly through the arts of Theron, an Athenian, who transacted the business of the surrender with the Spartans, was placed under the control of thirty men, who were generally called the Thirty Tyrants. They were at first nominally subjected to framacy by the Athenian state. Anmous, by his vigour and prudence brought about a counter-revolution, after defeating the Thirty at the Peiraeus, and restored the constitutional forms of the Athenian state (c. 403), which had survived eight months of despotism which had been paralleled by the Armenian revolution (c. 5). [See Theron, Thrasybulus.]

The subsequent events of Athenian history, to the time of Philip and Demosthenes, require only a short notice here. Inquiries on the part of Persia, and, still more, dissatisfaction with the Athenians, who, in the interim, had taken over the affairs of the states, and other cities against the Lacedaemonians, Agis Saulus was called from Asia to restore the fortunes of his country. The battle of Coronea (c. 394), though it might be a victory to the Spartans, did not leave them in the undisputed possession of their territory, though they were again, for a season, supreme in the deluded buildings that the world has ever seen. [See Pericles.] Athens, which hitherto does not appear to have had any pre-eminence in the imitative arts, was now adorned with public edifices, in which architecture and its sister sculpture, with painting, co-operated. The public edifices by the masterpieces of these three by far transcended any as yet
the head of a combined Greek and Persian fleet. About the
same time as the battle of Coroneia, he entirely de-
stroyed the Lacedaemonian fleet under the command of
Pericles. This was the first time in which the medi-
nimous position of Athens in the land and naval
supremacy of Athens. Conon appeared before the
Persians with the fleet which the Persian satrap Phar
nabas entrusted to him, and a sum of money for re-
building the walls. To Conon belongs the glory of restoring, after a ves-
tion of the Persian expedition, Athens from the
Demoseth. Lepitl. cap. 14), which Themistocles had
first erected by receiving the Lacedaemonians. [See ACHILIAS,
CONON.] The Peace of Antalcidas (b.c. 387 or 386) marks
an epoch in the general history of Greece, though the real
effect of the concord was not felt as the peace was just as worthless as if it
had never been made.

The period to the battle of Mantinea (b.c. 362) is one of
little interest for Athenian history. Thibetes, hitherto a
second-rate power among the states of European Greece,
contended, under Pelopestes and Epaminondas, with the
Spartans for the supremacy of Greece. Athens, during this
period, played an unimportant part, though her naval su-
priority still protected her against the Lacedaemonians, and
made her assistance of some weight in the balance. In
b.c. 376, Chabrias defeated Polias, the Lacedaemonian
commander, who was cruising about Eretria, Corinna, and Androos,
with the view of stopping the Athenian grain ships with their
swarms of corvids, which were waiting at Corinthian in Esburn;
and Themistocles gained another victory over the
Lacedaemonians in the same year. [See CHABRIA.]

The result of the war between Thibetes and Sparta was,
that there remained no state in Southern Greece which
possessed any real power of resistance. The northern
powerful by sea, was detected by the dependent towns and
islands for the oppressive exactions made both by the state
itself and by the commanders of the fleets. Cos, Rhodes,
Chios, and Byzantium united in a league (b.c. 359); Cha-
bras fell in an attack on Chios (b.c. 357), and an attempt
at reduced Byzantium also failed. This, which is sometimes
called the Social War, lasted three years. But at this
time a northern power, Macedon, which hitherto had exercised
considerable influence, advanced into Greece. The
Pompey, gradually began to mingle directly in the affairs of
Greece. The Holy War, or Phocian War [see PHOCIAN WAR],
as it is also called, which arose from apparently small be-
ginnings, brought the Athenians, who joined the Phocians,
to a contest with the Thebans and their allies, who pro-
posed to carry into effect the decrees of the Amphictyons
(b.c. 356). A long and bloody war which ensued was fa-
ourable to the views of Philip of Macedon, who, after several
humiliating defeats, and the loss of his most characteristic style
of fighting, was left to the Amphictyonian council, and was
opportunity of forming a party in Athens, and putting an end to the
war (b.c. 344), which had lasted ten years. The
history of Athens during the period of Philip requires a minute detail
[see Phip.[,], in which the Athenians and Thebans, with their
allies, were defeated by Philip, completely established the
Macedonian supremacy in Greece. In a public assembly at
Corinth, Philip was chosen generalissimo of the Greek nation
in the intended war against Persia; and after his assassi-
nation (b.c. 336), the same honour was conferred on his
son Alexander, who carried into effect that which his father
had designed.

From the Peace of Pericles to the time of Alexander, Athens,
though almost constantly engaged in war, had not neglected
to cultivate those arts which have associated her name with the
history of civilization. Her public buildings were con-
tinuously improved, and her riches were increased. She
was usually defeive to Lycurgus, the orator, the son of Lycon,
who built the Panathinaean Stadium, and provided for the
security of the city by the magazines on the Acropolis, and
by the blast-yards in the Piraeus. He is said also to have
constructed a fountain in the Market of the Odeum of Pericles.
Public speaking, without which there is no road to political power in a democratic state,
had been cultivated in Athens ever since the downfall of the
Empire of the Persians, and the preservation of their
principles to their skill in oratory as well as to their abilities or character.
Antiphon [see ANTIPHON] first formed oratory
as an art at Athens, or was the first who professed to
make it; and the introduction about the same time of the
dialectics of the sophists, of both which oratory and philosophy
availed themselves, made the study of oratory an indispensable
branch of education for all who aspired to eminence in the state. The school of Iseriates was of a different char-
acter from that of Antiphon; he was almost exclusively devoted to the
formation of a true speaker, his aim was to teach the
rhythm of expression. Demosthenes, the great master of
Athenian eloquence, was trained in the most laborious dis-
cipline of that period; from Isocrates he learned to form a
body of polished sentiments. Aristotle taught him to handle
the matter; and his own genius furnished him with the fervor
and the impulse of a complete orator.

After the time of Sophocles and Euripides, we find no
tragic writer who enjoyed any high reputation among the
Greeks, with the exception of Euripides, whose works
have left few fragments remain. But the dramatic art was
by no means neglected. Comedy assumed a new form in the
hands of Alexis and Antiphanes, whose scenes were
equalled only by the first, in the attempt to introduce
new scenes into the drama. But these attempts rose to greater importance during this period, not only be-
cause their art was valued for the pleasure which it gave,
but also for its close connexion with the successful practices of
elegancy, the path to political rank. The actor gained
wealth by his profession, and became also the instructor of
the orator in that which we may call the dramatic art of his
period. Demosthenes himself was indebted to the actors
Saturus and Andromacus for his superiority in action. On
many public occasions, and Aristodemus, a native of
an embassy to Philip, partly perhaps because the Macedonian
king was fond of his art, partly also, because Aristodemus
could assume on all public occasions as dignified a manner
as that which characterized Philip himself. [See Schlosser,
L. 2 Attic, i. 5 Attic.]

Anaxagoras entered into Athens the speculative phil-
osophy of the Ionian school, and he found a pupil and
supporter in the great Pericles, and in the poet Euripides.
From this period we may consider philosophy as in opposition
to the popular creed, since the speculations on things as well as the nature of man were entirely at variance with
those symbolic forms which constituted a chief part of the
spiritual form of philosophy, that is, the mythology of
the Greek race. Greece was divided into two branches, sprang the subtle dialectic which
established itself at Athens. Socrates himself was a master
in this science; his school, chiefly known through his dis-
ceptible Plato, requires a history by itself. [See SOCRATES,
PLATO.] The teaching of Plato belongs to the next
period. [See ARISTOTLE.]

In historical writing, Athenian literature has transmitted to us the history of the Pelopon-
nesian war by Thucydides, a work in which the dryness of the
period is entirely covered by the rich prose of the
author; and as the author generally puts into the mouths of his
speakers, Xenophon, a pupil of Socrates, has left us, in his Anabasis,
one of the most attractive military histories which ever was
written, a model of simplicity and good sense, in respect to
both the business of the campaign and the diction of
the Roman general in all that renders a narrative
interesting. Xenophon was also an historian, a philosopher,
and an economical writer (as the term was then understood),
but his fame must rest on his work of the Expulsion
of the young Cyrus, and perhaps on the philosophical
romance (the Cyropoeia) which has disguised the history of
the first Cyrus, the founder of the Persian monarchy.

Various modern writers have attempted to determine the
population of the few days of Athens also, and from such other considerations as appear applicable to
the question. Their results are very different, as might be expected in a case where even an approximation to truth is not attainable. We may always reason the distrust of the accuracy of abrupt statistics; and when to this is added the discrepancies of extant authorities, and the errors to which they have been exposed from transcription, we cannot place
any confidence at all in the results that have been deduced from this part of the work. The population of Athens also, included in the Athenian empire, was also mixed up with the population of the whole province
[see ATTICA,], and it is not easy to assign the proportions
which the capital and to the rest of the country.

Colonel Lenke (Topog. of Athens, p. 99) states the popu-
lation of Athens and the three miles of the republic to be:
he makes the citizens, 40,000; the
Muscici, or resident aliens, 15,000; the slaves, 53,000; and
 praises and others of Athenian race, not having rights of
citizenship, 10,000. We can hardly express a positive opinion as to the probability of 116,000 being above or below

VOl III.-D
the truth: but various objections may be made to the reasons by which the details of this investigation are supported. Bowkett (Public Economy of Athens, ii. 66. Trans.) has estimated the greatest possible amount of the ground and the port.

But the fact of any weight on which this assumption rests, is the circumstance of the houses in Athens being above 10,000 in the time of Xenophon. The author, to give some additional degree of probability to this result, estimates the number of the houses which, added to the population of the city and port, makes a total of 200,000. He then assumes the area of the city and port, together with the mining district, at thirty-two square miles, which he thinks will not give too great a population. But it is only obscure the question. Bowkett estimates the circuit of the city and sea ports at 200 stadia, which is considerably above the truth (see Athenaeus, p. 11); but he says nothing of the size of the city or the port, which certainly was not above three square miles. We have thus twenty-nine square miles for the mining district, which may be above or below the truth: but as we do not know the dimensions of this district, except that it was reckoned sixty stadia in one direction, nothing positive can be said about it. Though Bowkett's arguments as to the population of the city are inconclusive, we cannot help thinking that the population which he assigns to it is more in harmony with all known facts.

The greater estimate of Colonel Leake. Mr. Ginn (Rusti Hellanici, p. 148) states (in a dispassionate manner) that 160,000 inhabitants to the city and port, and some of his arguments are liable to objection, and especially so far as they rest on his assertion of the space occupied being larger than it actually was, to the time of Demosthenes and of Agisius. This that could not be the case will be evident, if we compare, as Colonel Leake has not neglected to do, the form of the walls of Rome with those of Athens; the circuit of the two walls might be nearly equal, but the space included would be different.

The population of the city depended, to a considerable amount, on foreign corn, which was derived from Euboea, the north-east of the Black Sea, and also from other places. About the Black Sea, as well as the Oenotrian and the Sabacinian, as early as the 9th to 8th century B.C. (Herod. II. 147), and perhaps earlier. In the time of Demosthenes (strato agnato eptypes) the importation of corn into Attica was very large, and the regulations respecting this trade formed an important part of the public economy of the city. The political history of Athens, during and after the age of Alexander, is of little importance. The city was often involved in the revolutions and movements of the Macedonian kingdom, and on the whole it enjoyed internal tranquillity to the time of the Roman civil wars. Athens owed chiefly to the control exercised by the various rulers of Macedonia. Soon after the death of Alexander the Laman war broke out, in which the city showed almost the last vestiges of its formidable limits. Rome made a triumph over the armies of the east. The result of the campaign was the occupation of Macedonia by a Macedonian garrison (c. 321); and the death of Phocion, which took place soon after, left Athens without a representative of her ancient statesmen. [See Antipater, Leochares, and Lamiatic War.]

Alexander, having got possession of Athens (c. 317), appointed Demetrius of Phalerum, supported by a Macedonian garrison, governor of the city. During ten years Demetrius secured to Athens, if not her old power, at least peace: under him Philo the architect added a portico to the great temple at Eleusis, and built the large arsenal in the Phocian Demetrius was a mere rhetorician, and a philosopher; but he was the friend of the comic poets Diphilus and Menander, the ornaments of the new Athenian comedy. Under his administration the character of the Athenians sank still lower; and public morals, perhaps never in Athens, at least since the days of Pericles, became still worse. Demetrius the Phalerian was expelled (c. 307), and the forms of the constitution were preserved.

Demetrius Philoctetes was a soldier, a man of talent, and a lover of pleasure. During his second residence at Athens (c. 301), he received the honours which were due only to the gods; temples were erected to his mistress; and the ashes of the Virgin Goddess herself on the Acropolis escape, description from the unbridled licentiousness of this second Achaeus (Plutarch, Demetr. 93, 94). Antigonus Gonatas got possession of Athens for a short time (Pausan. 3, 5, 6).

During the wars between the last Philip of Macedon and the Romans, the Athenians, together with Attalus, king of Pergamus, took the part of the foreign invaders. Athens, though weak in the field, was still strong within her walls; the Macedonians attacked both the Piraeus and the city before the Romans could come to their assistance (c. c. 207; but failing in his object, he turned his vengeance against the suburbs, and the numerous beautiful temples which adorned the Attic plain. ‘Not content’ (Livy, xxi. 19) he destroyed temples and statues, and even the very marble of which they were built. There can be no doubt that the invasion of Philip was most destructive to the monuments of Attica, though Eleusis and Athens itself escaped. [See Philip.]

The next great calamity of Athens was its capture by the Romans under Sulla (s. c. 66). Athens had espoused the cause of Mithridates, and admitted his general, Archelaus, into the Piraeus. The city was taken by assault (Plut. Sulla, 14), and the Roman soldiers made the streets swim with Athenian blood. This was the first time that the fortifications of Athens had been forced by an enemy. Sulla demolished the walls of the Piraeus, together with the great arsenal of Philo, and from this time the commerce of Athens was considerably impaired. Under Roman government, Athens, though she had lost her political power and her commerce, was still the centre of the arts and of philosophy, and a favoured residence of the wealthy Romans. It was at this period that of Hadrian it was occasionally honoured by the visits of the masters of the Roman world, and to them it owed much of that splendour which Pausanias admired in the second century of our era. As a school of learning, it was frequented by the Romans who wished to perfect themselves in the language and philosophy of Greece. The poet Horace was a student here when the civil wars broke out after the assassination of Julius Caesar; and Cicero was one of his moral treatises to his son Marcus, who was then studying here under Crassippus. (See Offic. lib. i. cap. 1.)

No other city ever enjoyed her fortune in the prosperity which attended her so long after the loss of her political importance. Even the republic, so long attached to Rome, since the decline of her temporal power, is but a feeble representation of that enjoyed by Athens during five centuries, among all the nations into which Grecian civilization had penetrated. We cannot have a stronger proof of this fact than that the most remarkable buildings erected in Athens, after the decline of her naval power, were executed at the expense of private fortunes. (Leake's Topography of Athens, pref. p. xiv.) To compress within one chapter, the monuments of the epoch are indicated in the above extract; we shall arrange in chronological order those events which are worthy of record as denoting the influence or the interest of foreign powers in this city, which the world at one time regarded as the parent and nurse of arts and philosophy.

B. C. 275. Ptolemy Philadelphus, king of Egypt, built a gymnasion near the temple of Theseus, and gave his name to a new tribe at Athens.

B. C. 240. Attalus, king of Pergamus, had also the honour of giving his own name to a tribe, and ornamented the Notum, or B. E. wall of the Acropolis, with four compositions in statuary, one of which commemorated his own victory over the Gauls (Pausan. i. 23).

B. C. 167. Antinous Ephebus, assisted by the architect Conon, commenced the great temple of Jupiter Olympius, which was not finished till the time of Hadrian.

B. C. 149. Abgarraizis II, king of Cappadocia, repaired the Odeum, or Music Hall of Pergamus.

B. C. 142. Julius Caesar, in 52 B.C., dedicated to the erection of the Propylaeum of the New Agora, which still exists.

A. D. 117. 138. Hadrian, the imperial architect, was the greatest benefactor of Athens. He finished the great temple of Jupiter, adorned the city with numerous other works of art, and furnished a new quarter of the Hadrianopolis with water by an aqueduct. Antoninus and M. Aurelius continued to extend to Athens the munificence of their predecessors; and at the same time Hercules Atticus, a native of Marathon, erected the theatre which bore the name of his wife Melia, at the foot of the Acropolis.
and covered with the white marble of Pentelicus the seats in the Stadium of Lycurgus. To this epoch belongs the description of Athens by Pausanias, which applies to a time when the great works of the age of Pericles still showed all their original freshness and perfection, and the colossal structure of the Olympian had just received its completion.

Though Athens was pillaged by Sulla’s soldiers, and perhaps with the other cities of Greece may have been robbed of some of its pictures and statues by the Romans on subsequent occasions, there is no reason for supposing that it was at the close of the second, or even the third century, Athens had lost much of its unrivalled works of art. The gradual decay of its buildings has been attributed with good reason partly to vagabond paganism (as in P.75lf.) and to the slow though gradual progress of the new faith.

A.D. 844. The walls of the city were repaired under Valerian.

A.D. 937. The Goths entered Athens, but were repelled by Dexionis an Athenian.

A.D. 398. Alaric took Athens, but probably did not treat it with great severity.

A.D. 420. General abolition of paganism in Greece and Athens in the reign of the younger Theodosius. About that time probably also, the Parthenon, the temple of the Virgin-Goddess, was converted into a church dedicated to the Virgin-Mother, and the temple of Theseus was appropriated to the warrior Saint George.

A.D. 845. The city was again conquered by one of his followers by Boniface, marquis of Montferrat, who assumed the title of king of Thessalonica. It continued in the possession of the Christians, but with many changes, till it fell into the hands of the Turkish sultan, Mohammed II., in 1456.

A.D. 1669. The Venetians under Morenae, when they occupied Athens, in 1669, were in the Arcadian of the Venetians under Morenae, when they occupied Athens, in 1669, were in the Arcadian of the

Athens has suffered much since that time, the siege of Morenae did infinitely more damage to the Parthenon than it had sustained during the 2000 years of its existence. The explosion of some powder which had been placed in it by the Turks, reduced it from its then almost perfect state to a ruin.

Athens was declared by a royal ordinance of the present year (1834) to be the capital of the New Kingdom of Greece.

The king visited it in March and laid the foundation-stone of his future residence. During the excavations lately made for the purpose of erecting new buildings, several works of ancient art have been dug up, and we may confidently hope that the restoration of tranquillity to this city will be favourable to a more complete illustration of its topography and antiquities. A fine boulevard, said to belong to the frieze of the Parthenon, has been lately discovered by the way in which the Acropolis is to be excavated. Most of the existing buildings have suffered during the war of independence, but fortunately the temple of Theseus has escaped with very little damage. Among the names of the projected new streets, we find those of 1834 and 1835, on the other hand, the new towers, history, and antiquities of Attica, in addition to the articles and works already referred to, see Lehrbuch der Griechen by K. F. Hermann, 1831; Borch’s Public Economy of Athens, English translation; Clinton’s Flora Hemis, etc.

ATHENS, a town in the state of Georgia, U.S., on the Oconee, a tributary to the Ocmulgee; it is ninety-two miles W. W. of Augusta on the Savannah river. It contains the courthouse and church, otherwise called the University of Georgia, which was founded by an act of the legislature in 1785, 9, and established at Athens in 1802. Its original endowment was 30,000 acres of unappropriated land, which will produce sufficient income, when leased according to the provisions of the original law, was sold in 1816, by the trustees, who obtained permission to that effect. The proceeds of the sales were 100,000 dollars, which are vested in the State bank; the Legislature guaranteed to the university an annual income of 30,000 dollars, and this sum makes an additional annual grant of 6000 dollars. The income from tuition varies from 3500 to 4000 dollars.

The university buildings consist of two brick edifices of three stories, for the accommodation of students, containing respectively 3200 and 3600 feet in the first, second, and third floors. The college library contains 3500 volumes, and the students' libraries 3000. The institution possesses a philosophical and chemical apparatus, a cabinet of minerals of 3000 specimens, and a botanical garden. The board of trustees consists of twenty-eight laymen; the board of visitors of ten laymen and five clergymen. Since the opening of the institution in 1802 to the present time, there have been six different presidents, all of whom, as usual in the case of the U. S., have been clergymen, with the exception of the first. The faculty in 1833 consisted of five professors and teachers, including the president; the number of students in 1833 was ninety-seven. The vacations are about eight weeks in the year. The expense of tuition, board, and books is about twenty dollars, or somewhat above 80l. per annum.

Athens is in a fine healthy situation, in the upper country of Georgia, at the distance of about 200 miles from the sea.

The seat of the University of Ohio, which was founded in 1802, by the Territorial Legislature, and endowed by Congress with two townships, which is seventy-two square miles, or 46,000 acres; this act was confirmed in 1804, by the State Legislature, after Ohio had been raised to the rank of a separate state. The institution consists of a college, organized about 1821, which is a brick building of four stories, and an academy. The college has a philosophical apparatus, and a library of 1000 volumes; there are two students’ dormitories of above 200 volumes each. The rents of the college lands at present amount to about 3500 dollars.

The faculty in 1833 consisted of five professors and teachers, including the president, who is a clergyman. The number of students in 1833, in the college classes, was forty-five; in the academical, 140. The board of trustees under expense for the session of forty-two weeks is only ninety-eight dollars, or about 21l. sterling. (American Almanac for 1834 &c.)

ATHENS, a small post-town in the state of Ohio, U.S., on a high peninsula, formed by a bend of the Hocking river, a tributary to the Ohio. It is a city of the University of Ohio, which was founded in 1802, by the Territorial Legislature, and endowed by Congress with two townships, which is seventy-two square miles, or 46,000 acres; this act was confirmed in 1804, by the State Legislature, after Ohio had been raised to the rank of a separate state. The institution consists of a college, organized about 1821, which is a brick building of four stories, and an academy. The college has a philosophical apparatus, and a library of 1000 volumes; there are two students’ dormitories of above 200 volumes each. The rents of the college lands at present amount to about 3500 dollars.

The faculty in 1833 consisted of five professors and teachers, including the president, who is a clergyman. The number of students in 1833, in the college classes, was forty-five; in the academical, 140. The board of trustees under expense for the session of forty-two weeks is only ninety-eight dollars, or about 21l. sterling. (American Almanac for 1834 &c.)

ATHERSTON, or Atherstone, a town in Atherston division, in the hundred of Hemlingford, in Warwickshire, close upon the border of Leicestershire, and on the road from London to Lichfield, 104 miles from London, and 16 from Lichfield.

This place, which owes its origin to the Saxons, stands on the great Roman Way, Watling Street. The manor was formerly held by William de Lusignan and Hugh Lupus, earl of Chester, and is called in Doomsday Book Aderstane. By Hugh Lupus the manor was bestowed on the monks of Bee in Normandy, who obtained by charter from Henry III. in 1246 and 1247 a yearly fair, to last three days, beginning on the eve of the Nativity of the Virgin Mary. The market is a market weekly on Tuesday. The market increased very much, from its convenient situation. Upon the securit of the lands of foreign religious houses in the reign of Henry IV., this manor was taken by the crown; and after having been successively granted to many individuals or religious houses, it passed to the family of the Reptonings, in which it long remained. King's College, Cambridge, to which it was granted by Henry VI., still receives 16l. yearly from it.

The seat of one of the most ancient and modest colleges in England, the college of St. John the Baptist, which is composed of thirty-two chappels, or chapels, and is the most ancient college in the university. The chapel is ancient, having been the nave of the church belonging to an Augustinian friary, founded by Lord Basset of Drayton in 1330. After the dissolution of the monasteries, the nave was granted to the inhabitants for a chapel of ease to the church at Atherstone. A south aisle of brick, added to this edifice, and a humble imitation of a modern Gothic tower, formed in 1802, the exterior of the college, the whole of which has been appropriated to the free school endowed by Sir William Verney and two other persons in 1573.

The chief manufacture of Atherstone is that of hats.
nian many inaccuracies, especially in the vocal points, and still more in the accents. David Codius asserts, in the preface to his own edition, that he observed six hundred omissions and corrections, of which he ventured to produce to his own edition of the Bible, that he corrected two thousand inaccuracies in the Bible of Athias. The edition of Athias was bitterly attacked by Samuel Marsius, in a letter published 1669. A reply to this letter was published the following title: "De Josephi Athiae juxta Dei veritatem, ab omni, et in omnium verbum, et omni error, ut in editione, bibliae, Joannis Athiae, aeditus est, corrigenda, et justificanda." D. Sam. Rorarius, &c. It has been supposed that Lessen, writing in the name of Athias, was the author of this reply, as it is well marked, that the copy of the second edition of the Bible of Athias differ from the rest. The cause of this difference was, that Athias had struck off five sheets of an edition of four thousand five hundred copies when he resolved to print five hundred copies more. The proviso of these supplemental sheets were not revised by Lessen, and consequently some copies contained slight variations in the first five sheets. Notwithstanding its defects, the Hebrew Bible of Athias had great merit, and has been the basis of all subsequent editions. The editions of Codius, Jablonski, Van der Hoogt, Opitz, Michaeis, Hahn, Houbigant, Simonis, Reineccius, Hurwitz, and others, may be considered as improvements upon that of Athias. The greater part of Athias was written by Syrians with Arabic cyphers, all former editions having only the Jewish method of notation.

The name Athias is also in Spanish, Jewish German (or that jargon mixed with Hebrew which is spoken in the Jewish colonies of the Holy Land) and in English. Of the English Bible he kept the types standing, and asserted that he printed and sold more than a million of copies; but this is scarcely credible, because the English Bible of Athias is rather scarce. The States General of Holland presented a gold chain and medal to Athias. (See Woitzi, Bibliotheca Hebraica, tom. i. p. 532—554; Le Long, Biblioth. Sac., part i. p. 116, &c.; Eielson, in das Alte Testament, von Richthorn. The prefaces to later editions of the Hebrew Bible are building on the foundations of Athias.)

ATHLONE, a borough in Ireland, of considerable importance from its situation on the river Shannon, and on the principal road which connects the metropolis with the western province of Connaught. It is about 12 miles from Dublin, nearly due west. The name Athlone is supposed to be a somewhat altered form of the Celtic Ath Lusin—Moon-Ford, or Ford of the Moon, the town being situated at a ford over the Shannon.

Athlone is in the barony of St. Peter and Killtem, in the barony of Athlone, in the county of Roscommon and province of Connaught; and St. Mary, in the barony of Brawney, in the county of Westmeath and province of Leinster. These parishes are separated from each other by the river Shannon, St. Peter and Killtem east of that river, and St. Mary east of it. The two parts of the town are united by a bridge of nine arches, built at the ford already noticed. This bridge is only twelve feet wide, and, in consequence of this narrowness of the passage, is a scene of great confusion in times when the occurrence of a fair or a market causes any increase in the ordinary traffic. Nearly in the centre of this bridge is a stone monument, erected in the reign of Queen Elizabeth, whose arms occupy one of the corners of the monument. There are besides this four other bridges in the parish of St. Peter, of which are over a canal, cut at the back of the town with the view of preserving the line of navigation of the Shannon, which had been interrupted by the ford and the bridges over the river.

The town is chiefly composed of strong stone houses, and has been long fortified. The walls and fortifications, which had been suffered to go to decay, have been strengthened within a few years. There are four gates, by which many guns of various calibres. The citadel or castle, which has been repaired in a more modern style of fortification, commands the bridge and the river. The town is very irregularly built, neither the straightness of the streets, nor the proportion of the height of the houses, nor the uniformity of fronts, having been attended to.

Athlone has no public buildings of any importance except the Seamen's house, where the quarter-sessions are held; and the new barracks, so close to the town as to be considered part of it. Here is accommodation for 2000 men;
and attached to it are magazines, armoury, ordnance yard, depot of military stores, and hospital. Before the magazines in the present barracks were built, the barracks and magazine were in the castle; but the magazine was blown up in 1697, having taken fire by lightning. Athole is one of the chief military stations and depots for arms in Ireland.

The site of worship of the Establishment, there is a large Romanesque chapel in St. Peter's parish, and a preaching-house in St. Mary's parish, supported by the Irish Baptist Society; in which last a free school also is taught. There is in the town a charter-school; also free schools. The mountains are bounded in the east by the Ochil, in the south by the Lomond and the Ochil, and in the west by the Grampian chain.

The manufacture of felt hats has long been carried on here, and the town has some celebrity for its felt. Friers are manufactured, and some linens are woven. There are two schools for girls, and Athole is well situated for trade, having the advantage of the Shannon, which is navigable thirty-eight miles farther up; and also of the Grand Canal, which communicates with Dublin, and joins the Shannon seventeen miles below Athole. There are three market days in the week, and the markets are well supplied with sea and river fish, vegetables, and fruit.

There are four fairs; two held in virtue of the charter of the corporation. These two appear to be held in the parish of St. Mary; the other two in that of St. Mary's. The town had a corporation created by James I., consisting of a sovereign, two bailiffs, twelve burgesses, and an unlimited number of freemen. The corporation can by their charter hold a court every three weeks for the recovery of small debts on its own petition, if the parties desire to have it. The corporation can decide summarily for any debt not exceeding five shillings. The corporation is also authorised to hold a court of pre-ponderance for administering justice in cases of injuries done during the fairs.

The borough sent two members to the Irish parliament; but, since the Union, it has returned only one.

Athole was rendered conspicuous in the Irish war which ensued upon the revolution of 1688. After the battle of the Boyne in 1690, the river Athole forms a line through which the troops of William of Orange passed into Scotland. Richard Grace, formerly chamberlain to that prince when Duke of York. While King William invested Limerick in person, he detached General Douglas to besiege Atholxne.

The eastern part of the town, called the English Town, was evacuated and burnt by Colonel Grace, who broke down some arches of the bridge and strengthened the western part (or Irish Town) of Athole with new works. Douglas summoned him to surrender; but Grace, firing a pistol at the messenger, gave the word to retreat. The English soldiers will give or receive; and after my provisions are consumed, I will defend the town till I eat my old boots. After battering the walls, the besieging army broke up and retired.

On the 21st of October, 1691, Athole was again attacked by General Ginkel; when the English troops, all in the English Town, determined to force the passage of the river by fording, and to storm the Irish Town. The garrison had been weakened by the flight (King James's commander-in-chief) of Colonel Grace to exchange the three tried regiments of foot, with which he had the year before defended the town, for three inferior ones in St. Ruth's army, and the attempt of Ginkel was successful with very trifling loss on the side of the assailants. The town was taken, the governor fell in the assault, and the army under St. Ruth, which was encamped in the neighbourhood, retreated to Aghrim, where it was in a few days entirely defeated by Ginkel, who received for his services in this war the title of Earl of Atholl, by the gallant

The population of the borough of Athole was, in 1821, 11,484; but the whole population of the three parishes of St. Peter, Kiltoom, and St. Mary, 19,681. Nearly all speak English and Irish; but the vernacular language seems to be on the decline. The inhabitants maintain many ancient customs. The parish of St. Mary is a rectory and vicarage in the diocese of Meath; that of Kiltoom a vicarage ecclesiastically united with the vicarage of Camna, both in the diocese of Ross. That of St. Peter is a perpetual curacy, also in the diocese of Ephin.

The river Shannon supplies a variety of fish. Pike, trout, bream, a few salmon in the season, perch, and eels, are taken; the latter in great abundance. Beas are sent in great quantities to Dublin.

ATHOLN, EARL OF. [See GINCKEL.]

ATHOL (i.e. pleasant land), a district in the northern part of Perthshire, in Scotland, formerly one of the hereditary jurisdictions into which many parts of Scotland were divided. It is bounded on the N. by Badenoch in Inverness-shire; on the N.W. and W. by Lochaber also in that county; on the S. by Breadalbane and Strathmore in Perthshire; on the E. by Forfarshire; and on the N.E. by Mar in Aberdeenshire. Its precise limits are not known, and its dimensions are considerable. In the Appendix to Sir John Sinclair's General Report, xiv., of Scotland, it is estimated at 450 square miles. The face of the country is very mountainous, and contains a part of the great Grampian chain; some of the peaks are the West Ben, with its famous bennean, three peaks, and Scarsoch, between Athol and Badenoch, 3390. The mountains are intersected by narrow gleses, watered by rapid rivulets. These, by their junction, form two rivers: the rivers Eden, Bruar, and Tilt, which fall through inlets in which their names occur, into the river Garry. This, in turn, becomes a tributary of the Tummel, which flows along the south part of the district into the Tay. The whole district of Athol is included in the basin of the last-named river (the principal in Scotland), for the Airlie water, which carries off the streams of the eastern parts, falls into the Erich, this into the Isla, and this again into the Tay. The chief lochs are Loch Rannoch, about nine miles long and one mile broad, and surrounded by mountains; Loch Tummel, on the boundary between Perth and Inverness-shires, about fourteen miles long, and, on an average, three-fourths of a mile broad, in the heart of a mountainous, bleak, and almost uninhabited country. In a great many parts of this district there are mountains which, after the battle of Culloden, Loch Lydoch, which is on the borders of Argyleshire and Perthshire, can scarcely be considered as belonging to Athol: it is about twelve miles long and of varying breadth. Loch Tummel and Loch Garry are about the same length as the latter, and Loch Inde, and the Tay. Loch Garry is near the source of the river of the same name.

The hills were formerly clothed with timber of various kinds, but the quantity of this is much reduced, and wood is now found only in the most sheltered places. It was formerly one of the best hunting districts in Scotland; but with the diminution of the native forests, the herds of deer have diminished also. The hills are now, in a great degree, devoted to the raising of sheep and cattle. However, a good number of red deer still remain, especially in the neighbourhood of the duke of Atholl's domains about Blair Atholl, where the Forest of Atholl, containing about 100,000 English acres, is set apart for them, and they are left free to roam over the whole country, when any parties are permitted to engage in deer-stalking. Fallow deer, in a state approaching to that of nature, are found on the south side of the range of bleak and commonly naked hills which separate Badenoch from Atholl. They are rarely seen on the summits, but generally in the gles of Tilt and Bruar.

In the gles by the side of the streams, strips of arable land are cultivated, and made to produce good crops of barley, oats, and potatoes. This district gives the title of Duke to a branch of the family of Murray; a name, however, little diffused in the district, where those of Stewart, Robertson, and Ferguson, are much more generally found.

In Atholl is the Pass of Killycrankie, celebrated for its picturesque beauty and for the victory and death of Graham of Claverhouse, Viscount Dundee, who fell in maintaining the cause of the house of Stuart, on the 17th July, 1692. Glen Tilt, along which a principal branch of the river Tay pursues its course for about ten miles above Blair Atholl, is to the geologist, classic ground; the observations which Dr. Hutton first made on the granitic veins exposed in that valley and on the composition and character of the rocks is now drawn up nearly at the same time and may be seen in the Transactions of the Royal Society of Edinburgh.
ATHOS, a mountain at the extremity of the long peninsula which projects from Chalidice, and separates the Gulf of Contium and Monte Santo, on the coast of Macedonia. The name Athos was properly applied to the whole mountainous peninsula, which is joined to the mainland by the low flat isthmus near the site of Aenos (Herd. vi. 22.) It is now known to the Franks by the name of Monte Santo, and to the Greeks as Ayion-oros, both implying 'holy mountain.' This appellation it has obtained from the number of monasteries, convents, chapels, and other sacred spots scattered round its sides. Some of the monasteries, of which there are twenty-six, are enclosed by high, curtailed walls, having rather the appearance of fortified towns than the abode of men devoted to the peaceful exercise of religion, and are provided with the means of defence and offence in several pieces of ordnance with which they are armed. Amongst the largest are, Xenophon, Iveron, Vatopedi, Panta-katara, Ayia Laura, St. Anne, and St. Paul. The number of monks alone in these establishments is supposed to exceed 8000, exclusive of lay brethren, artificers, and labourers. Ayia Laura contains upwards of 600 monks, and is subject to a very singular regulation, which some travellers have erroneously stated to be general throughout the peninsula; we refer to the prohibition of any female, even of the animal kind, being admitted within its walls. Herodotus (vi. 22) enumerates five towns within the peninsula of Athos.

The antiquity of these foundations is traced to the reign of Constantine; and authentic documents are still extant proving their existence in the time of Nicephorus Phocas, a.d. 961. The oath required from the monks is solemn and simple: to renounce for ever the world and its cares, considering themselves dead to all sublunary concerns, and to devote themselves to meditation, celibacy, retirement, and poverty. Though individually poor, there can be little doubt that the fraternities are by no means so; but it is their interest to conceal their riches, in order to avert the grasping avarice of the Porte. The principal stream of wealth flows from the spiritual source of religion, and consists in the oblations of pilgrims, who, in their peregrination to the chapel that crowns the sharp summit of the mountain, are expected to visit and contribute to each monastery on the tortuous road; yet the monks have not forgotten the temporal source of wealth from commerce, which is carried on chiefly with Salonica and Smyrna. This trade consists almost exclusively of fruits, of which the various species of nuts form the chief portion. The gardens of the monasteries, which are very extensive, produce both fruits and vegetables of all kinds, and are kept in the highest order, as well as the farms, called metoche, attached to the several monasteries: these are scattered over all the most fertile spots of the peninsula.

The Russians, Bulgarians, and Servians have each their respective monasteries; and caravans of from two to five hundred pilgrims arrive periodically from those countries, consuming every thing in the villages on their road. A visit to this sacred spot is of the same importance to the members of the Greek church as a pilgrimage to Mecca with Mohammedans. The chapel on the summit is, however, only reached by the more seafaring; the road is extremely difficult, requiring the use of both hands and feet to accomplish the ascent. None of the monks reside permanently in this chapel.

On the sides of the mountain are vast forests of pines, oaks, and chestnuts; the pines grow to an immense size. The appearance of the mountain is very magnificent, standing in lonely majesty at the termination of ridges of considerable elevation, and rising abruptly from the sea to a height of 6349 feet. The shores at its base are so steep that there is no anchorage for vessels, the small craft that trade here being obliged to keep constantly under sail while taking in their cargoes - within a quarter of a mile of the coast there are from 80 to 100 fathoms water. The dangers of the shores of Athos were experienced by the Persian fleet under Maronius (Herd. vi. 44), which was completely destroyed by a storm on this coast.

Although the monks themselves are shamefully ignorant, yet their monasteries possess libraries among which there
ATHY, a town in the county of Kildare in Ireland, about thirty miles S.W. of Dublin. It is on both banks of the river Barrow, which, flowing southwards, unites with the Suir below Waterford, and, forming the harbour of that city, flows into the sea. The Grand Canal from Dublin terminates here. The Barrow is navigable from hence to the sea, and the communication between Waterford and Dublin. Large quantities of corn are sold here weekly, and sent to Dublin.

Athy is situated in a pleasant country, better suited to agriculture than pasturage, and is close to an ancient ford, which early Irish history mentions as having been the scene of contests in domestic wars. Two monasteries erected on different sides of the river gave origin to the town. That on the west side was founded by Richard de St. Michael, lord of Rheeves, in the early part of the thirteenth century, under the invocation of St. Mathew, patron of canonries for crocheters, friars: and that on the east side was founded in 1253, for Dominicans, by the families of Bessell and Hogan. There are some few remains of both these edifices. Gerald, earl of Kildare, about 1506, at the foot of the bridge over the Barrow at Athy, that might serve to enlarge the English pale. This castle was repaired and enlarged by one William White, about 1575 and obtained from him the name of White's Castle. One tower still remains.

Athy was incorporated by charter of James I, and is governed by a recorder, sovereign, town-clerk, and two bailiffs. It sent two members to the Irish parliament, and was under the influence of the duke of Leinster. It is now alternately with Naas, the county-town for a constituency of Kildare; and the remaining tower of the castle already noticed is used as a prison and is an appendage to the county gaol of Naas. The population, in 1831, was 4494. There is a parish school for about ninety children (boys and girls), supported partly by subscription, partly by the Place Society; and a catholic free school, in which about twenty children of both sexes are instructed, is supported by subscription.

Athy is in three parishes, Reban or Churientown, St. Michael, and St. John (the last being a chapel), which, with others, form an ecclesiastical union in the diocese of Dublin and Glendalough, and in the ecclesiastical province of Dublin. The church, which is in the parish of St. Michael, was built about 1740, and is in good repair. The population of the whole union in 1831 was 5352.

The county court-house was erected some time after the church, and the barracks about thirty years afterwards. There are six fairs in the year.

Athy was burned by the Irish in 1308, and in 1315 plundered by the Scots under Robert Bruce.

ATKYNs, SIR ROBERT, a judge of the Court of Common Pleas during the reign of Charles II., and Lord Chief Baron after the revolution, was an eminent and approved lawyer. His distinguished character as a judge gave him a high standing among the bench and bar of the country; and his soundness of judgment was highly esteemed. He was one of the most zealous advocates for the popular courts of law and the independent independence of the judge in the prosecution of the duties of his profession. He was a munificent supporter of the administration of justice, and of the rights of the people in the government of their country. He was a man of great learning and ability, and was one of the most distinguished lawyers of his time. He was a man of great learning and ability, and was one of the most distinguished lawyers of his time. He was a man of great learning and ability, and was one of the most distinguished lawyers of his time. He was a man of great learning and ability, and was one of the most distinguished lawyers of his time. He was a man of great learning and ability, and was one of the most distinguished lawyers of his time.
ence, is uncertain; but in his evidence before a committee of the House of Commons previously to the impeachment of Sir William Serjeant, he charges the chief justice with having exercised the power of capital punishment without due process of law. In his cross-examination he had used in favour of the right of petitioning. (Commons’ Journals, Dec. 23, 1689.)

A circumstance occurred in the year 1682, which eventually induced Sir Robert Atkyns to resign his office of Recorder of Bristol, and to retire from the management of the corporation, and a contested election of members for the city to serve in the Oxford parliament, on which occasion Sir Robert Atkyns was an unsuccessful candidate in opposition to the interest of the corporation; he stood out, not to inflame the violence of party spirit. It happened shortly afterwards that he was present and voted at the election of an alderman, when his popularity, with the rest of the corporation, preferred an indictment for a riot, at the quarter sessions, against Sir Robert Atkyns and two others who were present at the election. The case having been moved to the King’s Bench, was tried at the Bristol summer assizes, in 1682, and the defendants were found guilty; upon which, Sir Robert Atkyns in the ensuing term peregrinated about the Court, and incurred the displeasure of the judges. His argument on this occasion, which is fully reported in the third volume of Modern Reports, p. 4, was temperate, forcible, and effective, and the Court of King’s Bench appeared on a technical point to acquit him; but Atkyns, by the advice of Chief Justice Pemberton, and his brother Sir Edward Atkyns, then one of the barons of the Exchequer, immediately resigned his recordership; which, in fact, was the only object of the prosecution.

On leaving the bench in the early part of the year 1680, Sir Robert Atkyns withdrew from all public occupation to his seat in Gloucestershire, where he lived for some years in great seclusion, ‘keeping no correspondence,’ as he himself expressed it, ‘and indulging in no degree with politics. It is clear, however, from his writings, that during his retirement he viewed with deep interest the political transactions of the time; and he cannot be supposed to have been indifferent to the desperate course which the government were pursuing.

In 1683, when the memorable trial of Lord William Russell took place, some friends and relations of that unfortunate gentleman applied to Sir Robert Atkyns for his advice and direction respecting the management of his defence. With reluctance he readily complied, and furnished the accused with a detailed note of such points of law and fact as he judged might be of importance and interest to him upon his trial. After the revolution he published connectedly two pamphlets, entitled A Defence of Lord Russell’s Inocency, in which he argues against the sufficiency of the indictment and the evidence, and justifies the reversal of the attainer, with great force of language and solidity of reasoning. His letter of advice respecting Lord Russell’s defence, together with a letter containing a criticism on the proceedings of the trial, and likewise his two pamphlets on the same subject, are published amongst his Parliamentary and Political Tracts. In the year 1689 he published a tract, entitled The Power, Jurisdiction, and Privilege of Parliament, and the Antiquity of the House of Commons, asserted. The occasion of this tract was the prosecution of Sir William Bylliams by the attorney-general, for having, as speaker of the House of Commons, and by express order of the House, directed Dangelin’s Narrative to be printed. The object of Atkyns’s argument, which displays much research and great legal and historical learning, was to show that this was entirely a question of parliamentary jurisdiction, of which the Court of King’s Bench ought not to take cognizance. By this means, Mr. Howell heard Sir William Atkyns a case in the thirteenth volume of the State Trials, p. 139, that the case was originally argued for the defendant by Sir Robert Atkyns, who, being unsuccessful in conducting it, as one which concerned every commoner in England, although he had so entirely retired from the profession that he was obliged to borrow a gown to appear in court. In the year 1692 this narrative was founded upon a mistake, Pollen and Jones being the attorneys, and an affidavit in contemporary reports, and Sir Robert Atkyns not being alluded to as having taken any part in the proceedings. He may, however, have prepared the argument for the occasion, which he did not deliver it in our afterwards published work. Sir Robert Atkyns was returned to the only parliament called by James II., as representative of the county of Gloucester; but he does not appear to have taken any part in the debates. In the reign of James II., he was connected with the minister of the church, or which was the king’s power to dispense with penal statutes, and which was suggested by the well-known case of Sir Edward Hale. In this treatise, he considers at large the doctrine of the king’s dispensing power. It is clearly and candidly written, and the truth of the reasoning against the royal prerogative contended for by the judges in Hale’s case will hardly be denied at the present day.

The precise part performed by Sir Robert Atkyns in promoting the revolution, no one can be ascertained; but his known political opinions, his intimate connexion with the principal actors in that event, and the marks of distinction bestowed upon him by the new government, render it highly probable that he was not a passive spectator of the change. In the month of April, 1690, he was appointed chief baron of the Exchequer, Sir John Hous being at the same time made chief justice of the King’s Bench, and Sir Henry Pollesen chief justice of the Common Pleas. In the latter part of the same year, he was chosen speaker of the House of Lords, and continued to hold that office until the grand seal was given to Lord Somers in 1693. During the long vacation in the following year, Sir Robert Atkyns, being then seventy-four years of age, signified his intention of finally retiring from public life; attempts were made by the government to induce him to continue on the bench, in consequence of some difficulty respecting his successor; but he adhered to his determination, and retired to his seat at Napaton Hall, near Cirencester, in Gloucestershire, where he spent the remainder of his life. He died early in the year 1709, at the advanced age of eighty-eight years. In 1734 his published writings were collected into one volume, under the title of Parliamentary and Political Tracts. Early in life he married Anne, daughter of Sir Thomas Dacres of Cheshunt, in Hertfordshire, by whom he had a son, Robert, who was knighted upon a visit of Charles II. to Bristol soon after the Restoration, and who was the author of the History of Gloucestershire.

ATLANTA (in Zoology), a genus of the heteropous mollusca of Lamarck, which Cuvier places next to carnivora. The animal is very small, and the shell very delicate. Lamaron thought that he had discovered, in one of these shells, the original of the fossil ammonites, or cornua Ammonis, which, however, must have belonged to the class of gastropodous mollusca, or cuttle-like animals. Atlanta inhabits the Indian seas. [See Heteropoda.]

Lesueur describes another marine genus, Atlas, which must not be confounded with the above. Atlas has no shell; and Cuvier confesses his inability to class it. 'So confused, says he, is its situation, that it belongs to the same family as Gasteropoda, and places it accordingly under Acrocerata, though he confesses that it is not entirely known.

The former of these genera, so called by the Greeks probably, from the well-known tale of Atlas supporting the heavens. This is a term applied to figures or half figures of men used in the place of columns or pilasters, to sustain an entablature: they are called also Talamones, a word of doubtful etymology, the one term of Jupiter, Olympus, or Agrigentum, restored by Mr. Cook, and described in

[Image: Atlanta Peronici.]

a Natural size.
the fourth volume of Stuart's *Athens*. Atlantes are represented standing upon a plinth placed on the entablatures above the pilasters of the cela of the temple, and supporting with their heads and arms the entablature on which the beams of the roof were to have been placed. The Atlantes of this temple, in form therefore, are built in courses of stone, corresponding with the walls of the cela, and partly attached to it. The annexed cut, showing

[From Temple of Jupiter at Agrigentum.]

the front elevation of the figures, with a profile of one of them, has been engraved with the permission of the publishers of Stuart's *Athens*. (For a more detailed account of these figures, see vol. iv. cap. i. of Stuart's *Athens*, published by Weale, Holborn.)

In the Tepidarium of the baths at Pompeii, Atlantes of baked clay, in high relief, and incrusted with the finest marble stucco, painted to represent life, are ranged at equal distances round the room, to support an entablature from which the arched ceiling springs; in the intervals between the figures, niches are formed for the dress of the bathers. The figures are about two feet high, and stand, like those at Agrigentum, on a plinth. In the annexed cut, from

[From Pompeii.]

the society's work on Pompeii, a representation of these figures is given.

In the architecture of the modern Italians, the Atlantes are often found supporting the entablature over an entrance to a palace or a garden. At Milan, there is a colossal example of the former; and the rustic gate to the Farnese Gardens at Rome, the design of Vignola, may be adduced as an example of the latter.

**ATLANTIC OCEAN** is the name given to that part of the ocean which separates the old from the new world; it washes the eastern shores of the Americas, and the western shores of Europe and Africa. Nature not having fixed any boundary between it and those seas which are adjacent to and communicate with it, we shall suppose that it is divided from the Pacific Ocean by a straight line drawn from Cape Horn, the southern extremity of America, to the antarctic pole, and from the Indian Sea by another drawn from the Cape of Good Hope to the same pole. On the north we may say that its boundaries are fixed by nature, in that continuous and imperious barrier of ice which extends between 80° and 82° N. lat. from the coast of Greenland to the island of Nova Zembla. By fixing these boundaries, a part of the Northern Polar or Icy Sea, as well as of the

Antarctic Ocean, is included in the Atlantic, but the contiguous parts cannot well be separated in a description of the Atlantic.

Though the Atlantic Ocean extends from pole to pole, its breadth is comparatively not great. The two continents which lie farthest apart are America and Europe, between 69° and 71° N. lat., where the coasts of Greenland are only 800 geographical miles from those of Norway, a distance hardly greater than that between Nantes in France and Cape Wrath in Scotland. Between Cape St. Roque in Brazil, about 25° S. lat., and the coast of Sierra Leone in Africa, between 5° and 8° N. lat., the continents are not above 1500 geographical miles from one another, or about as far as the North Cape from the Noire. These are the two parts where the width of the Atlantic is greatest. Its greatest breadth is under 30° N. lat., where the peninsula of Florida and the western coast of Marocco in Africa are separated by upwards of 3600 geographical miles, or 60° of latitude.

Humboldt compares the form of the Atlantic Ocean to that of a longitudinal valley, whose projecting and retiring angles correspond to one another. He supposes it to be formed by a very violent rush of the waters from the south, which being repulsed by the mountains along the coast of Brazil, took a direction towards the coast of Africa, and formed the Gulf of Guinea; here being stopped by the high coast of Upper Guinea, and obliged to run again to the west, the stream gave origin to the Caribbean Sea and the Gulf of Mexico, and ran between the mountains of western Europe and those of North America, until it gradually diminished in velocity and force, and at length subsided. In confirmation of this hypothesis, he observes, that the primitive mountains in the Brazilian provinces of Rio, Minas Geraes, Bahia, and Pernambuco are under the same degree of latitude as those of Congo, and that the immense plain along the banks of the Amazon river corresponds to that traversed by the Quorra; further, that the mountains of Parima in America lie opposite to those of Upper Guinea, and that the great plains, which before this catastrophe, according to his hypothesis, extended to the south of the present mouth of the Mississippi, and by the submergence of which the Caribbean Sea and the Gulf of Mexico were formed, are under the same parallel as the great desert of the Sahara.

The South Atlantic Ocean does not offer any other peculiarity in its formation, but the Northern is distinguished by several.

First, we may observe the formation of its islands lying within the polar circle. They are countries of considerable extent, but divided by extremely narrow, long, and winding straits, of very difficult navigation, which is increased by the ice being only for a few weeks in the year free from ice. For instance, the group of Nova Zembla consists of at least two larger ones; that of Spitzbergen of three larger and many smaller ones; and it is rather more than probable that the suppositional Arctic Sea, so well known by the name of Greenland is composed of a number of large islands, divided from one another by narrow, long, and winding straits. This peculiarity in the formation is repeated, though on a less scale, in the islands which skirt the coasts of Norway, where, in some instances, the straits which once divided them from the continent have been filled up by earthy matter, and now resemble exactly Glen More in Scotland. In no other part of the seas has such a distinction of the island been observed, except in those on the S.W. coast of America, and probably those on the N.W., about the latitude of Admiralty Island.

But a still more remarkable and more important feature of the North Atlantic, is its connexion with mediterranean, or close, seas of great extent. Such are the Baltic Sea and the Mediterranean Sea in the Old Continent, and Hudson's Bay and the Gulf of Mexico, with the Caribbean Sea, in the New World. These seas doubtless form part of the Atlantic Ocean; but they cannot be considered as forming an ocean on their own, the connexion between them and the Atlantic being effected by narrow straits, and not by an open sea; and, besides, they extend so far into the continents, that some of them, as the Mediterranean Sea, affords by itself a navigable space of 300° and 310° geographical miles, as it were, to the Gulf of Mexico, in the Indian Ocean, where the Gulf of Persia and of Arabia resemble rather the Mediterranean and the Baltic Seas, than the Gulf of Bengal or that of Guinea; but they are of much less extent. This peculiarity in its form brings
the Atlantic Ocean and its appendages into immediate connec-
tion with a much greater extent of country than the other
seas that wash both continents. We accordingly find that
the continental shores of the Atlantic exceed in extent
those of the Pacific Ocean and the Indian Sea, the two
other great divisions of the Ocean, to the north, south, east,
and west; though the last three times the surface of the
former.

The continental coasts of Europe from the strait of Wai-
gatz to that of Caffa (the entrance of the sea of Azoff),
are about 17,000 geographical miles; those of Asia along the
Black Sea, the Caspian Sea, the Caspian Gulf, and the Medi-
terranean Sea, are nearly 3000 miles; and the coasts of Africa,
along the Mediterranean Sea, are upwards of 2000 geographical
miles. Add to these the western shores of Africa from the
strait of Gibraltar to the Cape of Good Hope, which com-
pound a line of coast about three-fourths the whole length of
the shores of the Atlantic Ocean amount to 28,000 geographical
miles. In computing its western shores, we shall consider
Greenland as a part of the continent, though it probably is
not strictly true; and on this supposition we find that the
eastern shores of America comprehend about 20,000 geo-
 graphical miles. Consequently the shores of the Atlantic Ocean
have a circuit of about 48,000 geographical miles. The coasts
of Asia are upwards of 30,000 geographical miles; but nearly
9000 of them belong to the coast of the Caspian Sea and
northern shores of the Atlantic Ocean. The eastern coast of
Africa may be computed at 6000 geographical miles, and the
western coast of America at 11,000. Thus the coasts of the
Pacific Ocean and those of the Indian Sea taken together, add
nothing to the total circuit of the shores of the Atlantic Ocean:
they are but 12,000 geographical miles, or nearly 4000 miles less
than those of the Atlantic Ocean. We shall observe, that in this
calculation the northern shores of Asia along the Polar Sea are
included, and as they amount to upwards of 2000 geographi-
cal miles, it would not comprehend everything within the ide-
ality of the Atlantic Ocean, if this length is substracted. We shall
not enlarge on the advantages which such a peculiar form of
the Atlantic must offer for the progress of civilization.

The Atlantic is divided into three principal parts, which extend
into the interior of both continents, if the number and magnitude
of the rivers which flow into the Atlantic were proportionate
to the extent of its shores. On the eastern side, the surface,
whose drainage falls into the Atlantic, is comparatively limited,
and does not comprehend even a part of the whole of Europe :
the greatest river of this part of the world, the Volga,
carries its waters to the Caspian Sea. No European river
of the first or second class flows immediately into the Atlantic
Ocean; the largest being probably the Rhine, whose course
descends from Lake Constance, 720 miles, to the North Sea,
and the Danube, 1800 miles, to the Black Sea, and the
second class, the Nile, the Danube, and the Dnieper, enter
the Mediterranean Sea or its branches. The boundary line,
which marks the region from which the waters run into
the Atlantic Ocean on the east, is extremely irregular. On
this side, where the Uralian Mountains and the steppes
of Russia are in contact with the Uralian Mountains and
the steppes of Siberia, where the rivers that flow into the
Caspian Sea, and the rivers of the great Siberian chain of
mountains, enter the Caspian Sea, the drainage is pro-
gressing to the Caspian Sea. In the Mediterranean Sea,
which contains an average distance of less than a hundred
miles, and turns round to the Isthmus of Suez. In Europe it
embraces the valley of the Nile, the upper part of which is of
unknown extent. The whole of this river, which flows from
the Nile runs due west, following generally the thir-
tieth parallel till it arrives at the shores of the Atlantic,
except the Canary Islands. To the south of the thirtieth
parallel, the drainage of the Atlantic Ocean falls in with its
shores; the great African desert not being

included in it. What parts of Africa south of the Sahara
belong to the basin of the Atlantic Ocean, our present
graphic knowledge does not enable us to decide with
accuracy. Perhaps we shall not much overrate it, in sup-
posing that the drainage of half of its surface flows to the
Atlantic. We therefore may suppose that the basin of the
Atlantic contains about three millions of square miles in
Europe, not half a million in Asia, and about six millions
in Africa; which all taken together do not amount to more
than nine millions and a half, or about one-fourth of the
continent of America. But the new continent be-
goed almost entirely to its basin.

In South America, the water-shed between the Pacific
and Atlantic Oceans runs at a distance of from 25 to 20
miles from the shores of the former, except in the very
north of the coast of the Atlantic, where the vast and
extensive plains which cover the greatest part of the surface
of that continent send their waters to the Atlantic Ocean.
Probably not less than six millions of square miles of the
surface of South America belong to the basin of the Atlan-
tic, and only half a million to that of the Pacific Ocean.
In North America, the line which separates the waters falling
into both oceans lies at a much greater distance from the
shores of the Pacific Ocean; but even here the great plains
of the interior of the continent have not the same influ-
ence upon the waters of the Atlantic Ocean as upon the
waters of the Pacific Ocean.

The Atlantic Ocean being, in the present state of the
commercial and navigation, the most frequented road of
communication, has been examined more completely than
the other seas, with respect to its facilities for navigation. The
dangers and difficulties produced by numerous and intricate
routes of islands are of less frequent occurrence in this sea
than in any other. There are not at present the same
islands which separate the Gulf of Mexico and the Caribbean Sea
from the Atlantic, and which therefore are to be considered
as forming part of the shores of the ocean, it can hardly
be said to contain any group of islands between 50° N. lat. and
the equator, as the Celebes Islands, the Moluccas, the
Bermudas, and the Canaries, and the small islands of the
west end of America. The Canaries, included in Madeira, are
much resorted to by vessels, from their situation on the verge of the
regions in which the seas and winds are subject to continual
change, and not exposed to the violence of the storms which
occur in the regions nearer to the poles.

With respect to the winds, the whole surface of the
Atlantic Ocean may be divided into three regions, in one
of which the winds maintain a constant course from east to
west, and have obtained the name of trade-winds. This
region extends to about 60° of south, the eastern side of the
Canary Islands. The other two regions, to the north and south
of the thirtieth parallel in both hemispheres, are subject to a
continual change of the winds, and are therefore called the
regions of variable winds.

of Africa to those of America. It sometimes occupies not
much more than two, and at other times not up to ten degrees
of latitude. It is a remarkable circumstance that it does not
extend equally on both sides of the equator, but is rather
southern than northern. The reason for this is that the sun
is generally more southerly, and as it proceeds farther to the
west its direction becomes more southerly, the difference
twenty degrees west of Greenwich may be considered as
a line of separation between the winds which blow from
the south and those from the east. To the east of that line
the direction of the winds varies between S.W. and S.S.E.
and to the west of that line between S.E. and E.S.E.
The trade-wind blow do not begin to blow on the coast of
continents, but only at a considerable distance from them.
This is to be attributed to the different degrees of elevation
of the land and of the sea, where the wind over the land is ex-
tensive, must be broken up and produce a great change
from the sea. Thus, between the northern trade-wind and
the African coast, and between the Cape and the S. Africa
Islands, and more especially, between Cape Point and the
mouth of the Senegal, the wind blows constantly from the
west. This phenomenon is to be accounted for by the nature
of the great desert called the Sahara, whose surface, com-
posed of loose sand, is heated by the sun to an excessive
degree, and, rarely the superheated air, causes it to rise.
When this rarefied and hot air comes in contact with the
more dense strata of air covering the sea, the latter
expands over the deserts, and in this manner the west wind
along this coast is produced.

But this influence of the Sahara does not extend beyond
the coast of Cape Verde. Farther to the south, as far as
the coast of Mozambique, or more properly between 15° S.
and 30° S., the wind is in a different direction. It is, to the east of the coast of Calabar, a kind of monsoon prevails, blowing in the month of June and July, from the north-east or north
north-east to south-west, and this monsoon blows commonly with considerable force, and extends to a great distance from the shore, especially when the month of June and July, when it is in its height, at which time it sometimes is very near as far as the middle of the
Atlantic Ocean. To the north of the equator the trade
winds do not undergo any change along the coasts of
America. This is probably to attribute to the lowness of
the coast of Guiana, and that is extended and frequently
inundated during the lower course of the Orinoco. It
has been observed that in this latitude these trade-winds
extend so far over the land, that the current is felt at
Angostura, 240 miles from the mouth of that river.

These are the winds which blow on both sides of the
equator to the thirteenth degree of lat., in the region of the
atmospheric winds. To the north and south of this region
the winds are variable; but it is observed that westerly
prevails in both hemispheres; and, according to the computa-
tion of M. Berthelot, the proportion between those winds
from the west to those from the east, is as 9 to 1 in the
northern hemisphere. Besides being variable in direction,
they vary likewise extremely in the degree of force
with which they blow.

To these general observations we shall add a few others, with respect to the difference between the northern
and southern trade-wind. The direction of the trade-wind declines only from north-east to east, in its progressive westward, but it
is perturbed towards its southern bound by the ante-
monic pole. Between the south and north, or rather the thirteenth and thirty degrees of north latitude the wind is sometimes violent north-western winds. For that reason, ves-
Sels bound for the Indies or South America sail along the old continent till they attain the twenty-first
degree, when they turn to the west.
The southern trade-wind is more regular, and always
preserves its direction, and is less boisterous towards
its southern bounds. It extends, as we have already
observed, as we sometimes find in the sixteenth degree of north
latitude. In Africa, it blows from the
south-west; but at a distance from the coast it becomes more southerly, and as it proceeds farther to the
west its direction becomes more southerly. The difference
twenty degrees west of Greenwich may be considered as
a line of separation between the winds which blow from
the south and those from the east. To the east of that line
the direction of the winds varies between S.W. and S.S.E.,
and to the west of that line between S.E. and E.S.E.
The trade-winds do not begin to blow on the coast of

The southern trade-wind is more regular, and always
preserves its direction, and is less boisterous towards
its southern bounds. It extends, as we have already
observed, as we sometimes find in the sixteenth degree of north
latitude. In Africa, it blows from the
besides the tides, two kinds of motion are to be distinguished in the sea, which we shall name with Major Reconnell the drift-currents and the stream-currents. We refer their origin to the effects produced on the surface of the sea by the perpetual or prevailing winds; the former, even where they do not blow with great force, by their uninterrupted continuance displace and push forward only the surface of the sea in such a direction towards the region to which they blow. These drift-currents are constant, and run always in the same direction and commonly with pretty equal velocity. The drift-currents produced by the prevalent winds are not so constant, and are not so easily observed in the same direction as the drift-currents, with the same velocity. In the Atlantic Ocean, the former kind of drift-current is found only between the tropics, where it is produced by the trade-wind; and the latter to the north and south of the tropics, where they are ascribed to the effects of the prevalent winds.

The drift-current is, in some measure, observable all over that portion of the Atlantic Ocean which is under the influence of the trade-winds; but as these winds are not very constant to the north of the 23° parallel, and rarely extend to the south of the 9th, the current is constant only between these two boundaries. In the region of the calms it is very weak, and often entirely ceases. But in those regions in which the southern trade-winds blow, it is again strong and constant. In the Southern Ocean, where it has rather a northerly than a westerly motion; the latter, however, becomes by degrees more prevalent in proportion as the wind takes that direction in southern waters. The distance that a ship runs in a drift-current is from 9 to 10 miles per day, or, according to the computation of Humboldt, only one-fourth of the velocity with which those rivers in Europe commonly flow on which observations have been made.

The drift-current, which in the northern portion of the Atlantic is produced by the prevalent westerly winds, flows in a westerly direction; but it is not perpetual, and is so slow, that, when a ship keeps clear of the Gulf Stream, it only materially affects the whole course of a voyage from Europe and vice versa, returning the former and forwarding the latter.

It is easy to conceive that the drift-currents, especially the permanant, are very favourable to navigation, by rendering the voyages to some countries more easy, more certain, and of less danger. But the stream-currents are much less so. Up to the present time they have only proved adverse, causing great loss of life and property, and forcing vessels out of their course. Many navigators, running from Madeira to Rio de Janeiro, in the long, lie the coast of the latter island, have unexpectedly found their vessels cast upon the shores of Africa, nearly 300 miles out of their course. Such errors can only be detected by frequent astronomical observation, and by comparing them with the dead reckoning. If they are not detected in time, shipwreck sometimes becomes unavoidable.

We cannot compare the stream-currents of the ocean with the currents of the continents. The stream-currents cover such a portion of the surface of the sea, that they were transferred to the continents, they would no longer be considered as rivers, but as large branches of the sea. The causes to which they owe their origin are still involved in obscurity; our observations have not yet penetrated into the depth of the sea,—they have only slightly investigated its surface.—and there are some facts which lead to the opinion that the stream-currents are of great depth, and in many parts, if not in all, extend to the bottom of the sea. This indicates clearly that the currents must not be considered as mere currents which take place on its surface, and cannot affect the lower parts of its waters. The opinions which have been formed on this object may be seen under the article CURRENTS. We shall here only notice the largest of the present stream currents which belong to the Atlantic Ocean, and the Gulf Stream, flowing from North America to the shores of Europe.

The Equatorial current, so called from its course lying with the equator, may be supposed to be formed between the islands rated Thomas and Anno Bom, in the north or south of Bein. Hence it proceeds to the west on both sides of the equator, as far as 22° W. long., where it sends off a branch to the north-west. Soon afterwards it meets another, which runs more to the south-west, and together towards the capes of St. Augustin and St. Roque, on the Brazilian coast. At the distance of about 300 miles from these capes, it divides into two currents; the northern, running along the shores of Guiana, and hence deriving the name of Guiana Current; the southern, the Brazil Current, by the straits which separate the Leeward Islands, lying to the south of Martinique, from each other and from the continent of South America; and in some measure resembles the Caribbean sea. This current may be supposed to be formed from the branch of the equatorial current, running to the south-west along the shores of Brazil, to the mouth of the Plata River, and may even be traced to the Straits of Magalhaens and of La Maire. The length of this branch is unknown. We may suppose it to be about 1500 nautical miles more. The breadth of the current is different in different parts. Near the islands of St. Thomas and Anno Bom, it extends not quite over three degrees of latitude, occupying about 160 miles. But, in proportion as it approaches the west, it increases in breadth; opposite Cape Palmas it extends, except in a few places, over 5°; opposite Cape 8° lat. thus occupying in breadth more than six degrees, or upwards of 360 nautical miles. Further to the west it enlarges still more, and attains its greatest breadth, extending over 6° or 8° latitude. The breadth of this branch is from 9 to 10 miles per day, or, according to the computation of Humboldt, only one-fourth of the velocity with which those rivers in Europe commonly flow on which observations have been made.

The drift-current, which in the northern portion of the Atlantic is produced by the prevalent westerly winds, flows in a westerly direction; but it is not perpetual, and is so slow, that, when a ship keeps clear of the Gulf Stream, it only materially affects the whole course of a voyage from Europe and vice versa, returning the former and forwarding the latter.

The breadth of this branch is from 9 to 10 miles per day, or, according to the computation of Humboldt, only one-fourth of the velocity with which those rivers in Europe commonly flow on which observations have been made.
where the equatorial current runs, at least during those months in which it runs with great force.

That branch of the equatorial current which separates from it between 22° and 32° W. long., and at about 24° N. lat., is rather favorable to navigation, by forwarding the course of vessels returning from the south to the north. Its direction is toward the western direction; it may be called the North-west Current.

Its breadth is considerable, and may be estimated at the point of separation, at 100 or 200 miles; farther northward, even at 300; and at a northerly latitude, at 500 miles. Its velocity is not so great as that of the main equatorial current. Up to 15° N. lat., however, and even a little farther, it may run from 20 to 24 miles per day; but it then slackens, and becomes less perceptible, though it may at all times be traced by, and from, some of the islands and headlands belonging to the larger group of the Bahamas. At 35° N. lat. it is altogether imperceptible; but it soon increases in velocity, and before it enters the Strait of Florida at the Salt Keys, its track, one mile and a half per hour on an average; in the strait itself it acquires a formidable swiftness. The Strait of Florida begins at the Salt Keys, a reef lying 114 nautical miles to the north-east of Havana, and extends thence to the northward, where it terminates between the reefs of Cape Canaveral and the northern termination of the Lesser Caicos Islands Bank. But above 24° 30' N. lat., and along the whole north coast of the Florida peninsula, the current is very variable, and of small power. Hence, the trend of the Gulf Stream is south-west. After entering the Florida Strait, the velocity of the Gulf Stream soon increases to 24, 3, and occasionally 4 miles per hour; but after running at this rate about 90 miles, it arrives at the Narrows, where, past the barrier of the Biscayne Keys (belonging to the larger group of the Bahamas), the strait is only 44 miles wide, and its water-way, by reefs and shoals, is straitened to 334 miles. Here the current runs, in the month of August, at 3 miles per hour, and seldom below 5 nautical miles per day, and, on the whole, with very little diminution of velocity, runs northward along the shores of Florida to 31° N. lat., and afterwards nearly north-east along the shores of Georgia and of both Carolinas, as far as Cape Hatteras (about 39° N. lat.). In this course the current widens considerably in breadth, and decreases in velocity and temperature. Opposite the harbour of Charleston, its breadth is from sixty to sixty-three miles; and at Cape Hatteras, from seventy-two to seventy-five miles. At the latter place it runs only three and a quarter miles per day, and its temperature has fallen from 86° to 82°. At Cape Hatteras, the north-westerly or inner edge of the current is twenty-four miles south-east of the cape.

By the falling back of the coast north of Cape Hatteras, the current continues in the same direction as before, while the main body continues its former course to the north-east to a considerable distance. At about 40° N. lat. it meets the extensive Nantucket and St. George's Banks, which turn it off seaward, and it may be traced as far north as 45° N. lat. From this point it runs in the direction E. by N., bringing the southern extremity of the Great Bank of Newfoundland, and it continues in this line to 43° and 44° long. and 39° and 43° lat. Here, however, it bends by degrees to the east, south-east, and south, and having enclosed the islands of Flores and Corvo, which belong to the group of the Azores, its traces are lost in the waters of the ocean.

Sometimes, though rarely, the warm water of the current has extended the shores of Europe in the north-west. In these cases, the current, by its very great width of 300 miles, has the least effect in changing the direction of the stream-current, which continues, though much weakened, farther to the south, and may be traced to the Straits of Magalhaens and La Plata. As this current is formed between Brazil and the coast of Africa, it is the opinion of many intelligent navigators that the temperature of the water is affected by the seasons, for both extremes have been found to exist in the same month (May), between 83° and 85° long. It is probable that the main current does not always run in the same places, but...
ATHOS, a mountain at the extremity of the long peninsula which projects from Chalcis, and separates the Gulf of Consta and Monte Santo, on the coast of Macedon. The name Athos was properly applied to the whole mountainous peninsula, which is joined to the mainland by the low flat isthmus near the site of Acanthi. (Heron. vi. 22.) It is now known to the Franks by the name of Monte Santo, and to the Greeks as Ayia- oros, both implying 'holy mountain.' This appellation it has obtained from the number of monasteries, convents, chapels, and other sacred spots scattered round its sides. Some of the monasteries, of which there are twenty-six, are enclosed by high fortified walls, having rather the appearance of fortified towns than the abode of men devoted to the peaceful exercise of religion, and are provided with the means of defence and offence in several pieces of ordnance with which they are armed. Amongst the largest are, Xenophon, Ierou, Vatopadi, Pantokrator, Ayia Laura, St. Anne, and St. Paul. The number of monks alone in these establishments is supposed to exceed 8000, exclusive of lay brethren, artisans, and labourers. Ayia Laura contains upwards of 600 monks, and is subject to a very singular regulation, which some travellers have erroneously stated to be general throughout the peninsula; we refer to the prohibition of any female, even of the animal kind, being admitted within its walls. Herodotus (vi. 22) enumerates the towns within the peninsula of Athos.

The antiquity of these foundations is traced to the reign of Constantine; and authentic documents are still extant proving their existence in the time of Nicephorus Phocas, A.D. 961. The oath required from the monks is solemn and simple: to renounce for ever the world and its cares, considering themselves dead to all sublunary concerns, and to devote themselves to meditation, celibacy, retirement, and poverty. Though individually poor, there can be little doubt that the fraternities are by no means so; but it is their interest to conceal their riches, in order to avert the grasping avarice of the Porte. The principal stream of wealth flows from the spiritual source of religion, and consists in the obligations of pilgrims, who, in their peregrination to the chapel that crowns the sharp summit of the mountain, are expected to visit and contribute to each monastery on the tortuous road; yet the monks have not forgotten the temporal source of wealth from commerce, which is carried chiefly with Salonic and Smyrna. This trade consists almost exclusively of fruits, of which the various species of nuts form the chief portion. The gardens of the monasteries, which are very extensive, produce both fruits and vegetables of all kinds, and are kept in the highest order, as well as the farms, called metochi, attached to the several monasteries: these are scattered over all the most fertile spots of the peninsula.

The Russians, Bulgarians, and Servians have each their respective monasteries: and caravans of from two to five hundred pilgrims arrive periodically from those countries, consuming every thing in the villages on their road. A visit to this sacred spot is of the same importance to the members of the Greek church as a pilgrimage to Mecca with Mohammedans. The chapel on the summit is, however, only reached by the more zealous; the road is extremely difficult, requiring the use of both hands and feet to accomplish the ascent. None of the monks reside permanently in this chapel.

On the sides of the mountain are vast forests of pines, oaks, and chestnuts: the pines grow to an immense size. The appearance of the mountain is very magnificent, standing in lonely majesty at the termination of ridges of considerable elevation, and rising abruptly from the sea to a height of 6349 feet. The shores at its base are so steep that there is no anchorage for vessels, the small craft that trade here being obliged to keep constantly under sail while taking in their cargoes: within a quarter of a mile of the coast there are from 80 to 100 fathoms water. The dangers of the shores of Athos were experienced by the Persian fleet under Mardonius (Herod. vi. 44), which was completely destroyed by a storm on this coast.

Although the monks themselves are shamefully ignorant, yet their monasteries possess libraries among which there
Athy was incorporated by charter of James I., and is governed by a recorder, sovereign, town-clerk, and two bailiffs. It sent two members to the Irish parliament, and was under the influence of the duke of Leinster. It is now administered with Naas the borough of Kildare; and the remaining tower of the castle already noticed is used as a prison and is an appendage to the county gaol of Naas. The population in 1831, was 4,494. There is a parochial school for about ninety children (boys and girls), supported partly by subscription and partly by the Kildare Place Society; and a catholic free school, in which about 240 children of both sexes are instructed, is supported by subscription.

Athy is in three parishes, Rehan or Churientown, St. Michael, and St. John (the last being a chasuble), with others, form an ecclesiastical union in the diocese of Dublin and Glendalough, and in the ecclesiastical province of Dublin. The church, which is in the parish of St. Michael, was built about 1740, and is in good repair. The population of the whole union in 1831 was 6,539.

The county court-house was erected some time after the church, and the barric about thirty years afterwards. There are six parishes in the union.

Athy was built for the Irish by the Irish in 1308, and in 1315 plundered by the Scots under Robert Bruce.

ATKYNs, SIR ROBERT, a judge of the Court of Common Pleas during the reign of Charles II., and Lord Chief Justice of Ireland during the Commonwealth, was a learned lawyer, much distinguished for his attachment to popular rights and for the uprightness and independence of his conduct during a period of judicial profligacy and subserviency. He was descended from an ancient and opulent family in Gloucestershire. On the sea as well as in the air, his peculiar characteristic was a singular circumstance, that for more than 300 years consecutively, some member of this family always presided in one of the superior courts of law. His father, Sir Edward Atkyns, was a judge of the Court of Common Pleas during the Commonwealth, and shared with Hale, Rolle, Wyndham, and other judges, the merit of the various improvements in the administration of the law which took place at that period. Immediately after the Restoration, Sir Edward Atkyns was named as one of the judges in the special commission for the trial of the regicides, and appointed a Baron of the Exchequer, in which latter office he continued till his death, which took place in 1665, at the age of 82. The exact date of Sir Robert Atkyns's birth has not been ascertained; but there is no doubt that he was born in the course of the year 1621. He received the rudiments of his education at his father's house in Gloucestershire, and was afterwards entered at Balliol College, Oxford. After spending several years at the University, he removed to the continent of Europe, to the continuation of his professional studies to Lincoln's Inn, of which society his father had been a member. Of his history and conduct during the Commonwealth, no particulars have been preserved; but as he was a Knight of the Bath, with many persons by condescension, at the annunciation of the year 1660, it is probable that with his father he had attached himself to the moderate party in the profession during that troublesome period. He was returned to the first parliament of Charles II., for the borough of East Lothian, and continued to hold his seat till he was raised to the Bench; and from the frequent mention of his name on Committees, and in the general business of the House, he appears to have devoted much of his time to parliamentary duties. He retained a seat for some time before his removal to the Bar, and his name is to be met with frequently in the Bar. In 1661 he was chosen recorder of Bristol; and in the early part of the year 1672 he was made a judge of the Court of Common Pleas, having been for some time before Solicitor-General to the Queen. His conduct and opinions have maintained his general character for learning and independence, though, from his language and conduct on the trials of the Jesuit priests and other persons charged with the Popish plot in 1678, he has incurred some censure. In the year 1688, he was a supporter of the cause of the Prince of Orange, which pervaded the country respecting that transaction, and to have played his part in the disgraceful tragedies at that time enacted in Westminster Hall.

In the year 1689, however, the conduct of the court was changed by the corruption of the judges for the introduction of arbitrary measures, drove him from the bench. Whether he was displaced by the crown, or whether he voluntarily resigned a situation which he could not retain without sacrificing his independ-
ence, is uncertain; but in his evidence before a committee of the House of Commons previously to the impeachment of Sir William Scroggs, he charges the chief justice with having made an ill representation to the King of some ex-
ceptions he had used in favor of the right of petitioning. (Commons' Journals, Dec. 23, 1680.)

A circumstance occurred in the year 1682, which eventually induced Sir Robert Atkyns to resign his office of recorder of Bristol. Much dissension prevailed among the members of the corporation and a contest arose of members desiring the city to serve in the Oxford parliament, on which occasion Sir Robert Atkyns was an unsuccessful candidate in opposition to the mayor, tended not a little to inflame the various parties. It happened shortly after that he was present and voted at the election of an alder-
man, when an individual obnoxious to the mayor was chosen. The meeting at which this election took place, though attended by a majority of the aldermen, was as-
sembled without a legal summons from the mayor and against his wishes; upon which, the mayor and the rest of the corporation preferred an indictment for a riot, at the quar-
ter-sessions, against Sir Robert Atkyns and two other persons who were present at the election. The case having been re-
moved into the King's Bench, was tried at the Bristol sum-
er assizes, in 1682, and the defendants were found guilty; upon which, Sir Robert Atkyns in the ensuing term per-
sonally appeared in court and moved in arrest of judgment. He was granted a new trial on this occasion. Fully replying to the third volume of Modern Reports, p. 4, was temperate, forcible, and effective, and the Court of King's Bench ar-
rested the judgment upon a technical error in the indict-
ment. By the advice of his chief Justices, Pemberton, and his brother Sir Edward Atkyns, then one of the bar-
os of the Exchequer, immediately resigned his recordership,

the front elevation of the figures, with a profile of one of them, has been engraved with the permission of the publisher of Stuart's "Athens." (For a more detailed account of these figures, see vol. iv., cap. i. of Stuart's "Athens," published by Weale, Holborn.)

In the Tepidarium of the baths at Pompeii, Atlantes of baked clay, in high relief, and incised with the finest marble stucco, painted to represent life, are ranged at equal distances round the room, to support an entablature from which the arched ceiling springs; in the intervals between the figures, niches are formed for the dress of the bathers. The figures are about two feet high, and stand, like those at Agrigentum, on a plinth. In the annexed cut, from the Society's work on Pompeii, a representation of these figures is given.

In the architecture of the modern Italians, the Atlantes are often found supporting the entablature over an entrance to a palace or a garden. At Milan, there is a colossal example of the former; and the rustic gates at the entrance to the Parco Sempione at Milan, the design of Vignola, may be added as an example of the latter.

The name of the figure is attributed to that part of the name which separates the old from the new world; it was given to the eastern shores of the Americas, and the western shores of Europe and Africa. Nature not having fixed any boundary between it and the northern seas, which are adjacent to and connected with it, we shall suppose that it is divided from the Pacific Ocean by a straight line drawn from Cape Horn, the southern extremity of America, to the northeastern point of the island of Nova Zembla. By fixing those boundaries, a part of the Northern Polar or Icy Sea, as well as of the

Antarctic Ocean, is included in the Atlantic, but these contiguous parts cannot well be separated in a description of the Atlantic.

Though the Atlantic Ocean extends from pole to pole, its breadth is comparatively not great. The two continents which form its shores appear nearest one another between 60° and 65° N. lat., where the coast of South America is only 800 geographical miles from those of Norway, a distance hardly greater than that between Nantes in France and Cape Wrath in Scotland. Between Capet St. Roque in Brazil, about 5° S. lat., and the coast of Sierra Leone in Africa, between 5° and 6° N. lat., the continents are not above 1,500 geographical miles from one another, or about as far as the North Cape from the Norwes. These are the two parts where the width of the Atlantic Ocean is least. Its greatest breadth is under the Equator, between the coast of the island of Florida and the western coast of Morocco in Africa, separated by upwards of 3,600 geographical miles, or 60° of latitude.

Humboldt compares the form of the Atlantic Ocean to that of a longitudinal valley, whose projecting and retiring angles correspond to one another. He supposes it to be formed by a very violent rush of the waters from the south, which being repulsed by the mountains along the coast of South America, took a direction towards the north, and formed the Gulf of Guinea; here being stopped by the high coast of Upper Guinea, and obliged to run again to the west, the stream gave origin to the Caribbean Sea and the Gulf of Mexico, and issuing thence ran between the mountains of Western Europe and North America, its course gradually diminished in velocity and force, and at length subsided. In confirmation of this hypothesis, he observes, that the primitive mountains in the Brazilian provinces of Rio, Minas Geraes, Bahia, and Para, resemble the mountains in the same degree of latitude as those of Congo, and that the immense plain along the banks of the Amazon river corresponds to that traversed by the Quorra; further, that the mountains of Parime in America lie opposite to those of Upper Guinea, and that the great plain, which before this catastrophe, according to his hypothesis, extended to the south of the present mouth of the Mississippi, and by the submersion of which the Caribbean Sea and the Gulf of Mexico were formed, are under the same parallel as the great desert of the Sahara.

The South Atlantic Ocean does not offer any other peculiarity in its formation, but the Northern is distinguished by several.

First, we may observe the formation of its islands lying within the polar circle. They are countries of considerable extent, but divided by extremely narrow, long, and winding straits, of very difficult navigation, which are increased by their being continued for a few weeks in the year, free from ice. For instance, the group of Nova Zebril consists of at least two larger ones; that of Spitbergen of three larger and many smaller ones; and it is rather more than a supposition, that the extensive country known by the name of Greenland is composed of a number of large islands, divided from one another by narrow, long, and winding straits. This peculiarity in the formation is repeated, though on a less scale, in the islands which skirt the coasts of Norway, where, in some instances, the string which once divided them from the continent have been filled up by earthy matter, and now resemble exactly Glen More in Scotland. In no other part of the seas has such a disposition of islands been observed, except in those on the coast of America, and those on the N.W. coast of the Antarctic Ocean.

But a still more remarkable and more important feature of the North Atlantic, is its connexion with Mediterranean, or ocean, seas of great extent. Such as the Mediterranean Sea in the Old Continent, and Hudson's Bay and the Gulf of Mexico, with the Caribbean Sea, in the New World. These seas doubtless form part of the Atlantic Ocean; but they cannot be considered as bays or gulfs, the connexion between them is effectuated by narrow straits, and not by an open sea; and besides, they extend far into the continents, some of them, as the Mediterranean Sea, affords itself a navigation of 3,600 geographical miles. Some parts of the seas, where the Gulfs of Persia and of Arabia resemble rather the Mediterranean and the Baltic Seas, than the Gulf of Bengal or that of Guinea; but they are of much less extent. This peculiarity in its form brings

Vol. III. - E
the Atlantic Ocean and its appendages into immediate contact with a much greater extent of country than the other seas, and so obtain a more thorough going knowledge of the continental shores of the Atlantic exceed in extent those of the Pacific Ocean and the Indian Sea, the two other great divisions of the Ocean, taken together, though the latter cover at least three times the surface of the former.

The continental coasts of Europe from the strait of Waddenzee to that of Caffa (the entrance of the sea of Azof), are about 17,000 geographical miles; those of Asia along the Black Sea, the Sea of Marmora, and the Mediterranean Sea, are nearly 3000 miles; and the coasts of Africa, along the Gulf of Guinea, are nearly 4000 geographical miles. Add to these the western shores of Africa from the strait of Gibraltar to the Cape of Good Hope, which comprehend about 6000 geographical miles, and the whole eastern shores of the Atlantic Ocean amount to 28,000 geographical miles. In computing its western shores, we shall consider Greenland as a part of the continent, though it probably is not exactly true; and on this supposition we find that the eastern shores of America comprehend about 20,000 geographical miles. Consequently, the coasts of the Atlantic Ocean have a circuit of about 45,000 geographical miles. The coasts of Asia are upwards of 30,000 geographical miles; but nearly 9000 of them belong to the Mediterranean Sea, and consequently to the Atlantic Ocean. The eastern coast of Asia includes about 6000 geographical miles, the whole western coast of America at upwards of 11,000. Thus the coasts of the Pacific Ocean and those of the Indian Sea taken together do not amount to much more than 44,000 geographical miles, or nearly 4000 miles less than those of the Atlantic Ocean. In the conclusion we mention the northern shores of Asia along the Polar Sea are included, and as they amount to upwards of 2600 geographical miles, the account is still more in favor of the Atlantic Ocean. We shall here enlarge on the advantages which such a peculiar form of the Atlantic must offer for the progress of civilization.

These advantages would extend to a great distance into the interior of both continents, if the number and magnitude of the rivers, and the seas, were proportionate to the extent of its shores. On the eastern side, the surface, whose drainage falls into the Atlantic, is comparatively limited, and does not comprehend even the whole of Europe: the greatest river of this part of the world, the Volga, carries its waters to the Caspian Sea, and no European river of the first or second class flows into the Atlantic Ocean; the largest being probably the Rhine, whose course does not exceed 700 English miles. But three rivers of the second class, the Nile, the Danube, and the Dnieper, enter the Mediterranean, and moreover, the boundary line which marks the region from which the waters run into the Atlantic Ocean on the east, is extremely irregular. On the north it begins with the most northern extremity of the Ukraine and follows the sixty-first parallel, where, at the sources of the Kamianka, it suddenly turns to the south-west and then to the west, in which direction it continues to the sources of the Volga, hardly 150 miles distant from the Gulf of Finland. From this point it runs nearly south to the 52° of lat., from which it extends east-south-east between the tributaries of the Volga on one side, and those of the Dnieper and Don on the other. Having thus attained the 45° of E. long., and nearly the 50° of N. lat., it takes a due southern direction between the Neva and Volga, and finally reaches the middle of the Caucasus, it declines to the south-west, and separates the upper course of the Euphrates from the small rivers which fall into the Black Sea and the Gulf of Scædar. From these, the Volga along the coast of Syria at an average distance of less than 150 miles, and then, in a southerly direction, to the Isthmus of Suez. In Africa it encloses the valley of the Nile, the upper part of which is of unknown extent. To the east of this river, the boundary of the Atlantic Ocean, the westernmost branch of the Indian Ocean, and at the sources of the Nile it is at least 1600 miles distant from the Mediterranean Sea, and consequently from the Atlantic, the greatest distance which it probably attains in the old world. From near the mouths of the Volga and Don to the 45° of lat., following generally the thirteenth parallel till it arrives at the shores of the Atlantic Ocean opposite the Canary Islands. To the south of the thirtieth parallel, the boundary of the drainage of the Atlantic Ocean falls in with its shores; the great African desert not being included in it.

What parts of Africa south of the Sahara belong to the basin of the Atlantic Ocean, our present geographical knowledge does not enable us to determine with accuracy. Perhaps we shall not much overrate it, in supposing that the drainage of half of its surface flows to the Atlantic. We therefore may suppose that the basin of the Atlantic contains about three millions of square miles in Europe, not half a million in Africa; which all taken together do not amount to more than nine millions and a half, or about one-fourth of the continent of the ancient world; but the new continent belongs almost entirely to its basin.

The strait of Gibraltar is the passage between the Pacific and Atlantic Oceans runs at a distance of from 20 to 25 miles from the shores of the former, except in the very southern extremity of the Andes (see ANDES), and the extensive plains which cover the greatest part of the surface of that continent send their waters to the Atlantic Ocean. Probably not less than six millions of square miles of the surface of South America belong to the basin of the Atlantic, and only half a million to that of the Pacific Ocean. In the line which separates the waters falling into both oceans lies at a much greater distance from the shores of the Pacific Ocean; but even here the great plains to the east of the Stony Mountains send their rivers to the Atlantic: so that, if we assign to the Pacific Ocean even one half of the inland surface drained by the rivers falling into the Atlantic, may amount to upwards of six millions of square miles, whilst those falling into the Pacific probably do not drain more than two millions. According to this account, the basin of the Atlantic on both sides of the world of the Atlantic and which there are to be considered as forming part of the shores of the oceans, it can be said to contain any group of islands between 30° N. lat. and 50° S. lat. The groups of the Azores, Canaries, and Cape Verde Islands, as well as those of Guinea and the Berbers, are parts of the boundaries which mark the region from which the waters run into the Atlantic Ocean.

The Canaries, included Madeira, are much resorted to by vessels, from their situation on the verge of the regions in which the elements essential to navigation (viz., the air and the water) undergo a change: for to the south of these islands, the air, as well as the southerly currents, are generally much less changeable than in the latitudes nearer to the poles.

With respect to the winds, the whole surface of the Atlantic Ocean may be divided into three regions, in one of which the winds maintain a constant course from east to west, and have obtained the name of trade-winds. This region extends to about 30° of lat. on both sides of the equator. The other two regions, to the north and south of the equatorial belt, are parts of the winds in the two hemispheres, subject to a continual change of the wind, and are therefore called the regions of variable winds.

It is not here our object to enter into an explanation of the natural causes which produce the phenomenon of the trade-winds [Trade Winds]; but we shall historically observe the deviations of the wind, which are found to exist in the Atlantic Sea, and which themselves affect the navigation of it no less than the trade-winds.

The eastern part of the region of the trade-winds, where winds blow, on the north side of the equator, from northeast; and on the south, from south or southwest, as we shall see hereafter. If they continued in these directions, they would of course meet another, but this is not the case: the trade-winds, which are called by the region of calms. This region is not always of the same extent, and does not occupy the same part of the ocean, though it always extends over the whole of it from the coasts.
of Africa to those of America. It sometimes occupies not much more than two, and at other seasons up to ten degrees of the mid-latitude of the equator, and is therefore not confined to the southern hemisphere. This column of air extends equally on both sides of the equator, but is rather in the northern hemisphere. It rarely extends to the south of the line, and never further than two and a half degrees of southern latitude. The position of this column of air is not the same as that of the northern; it is not a line of separation between the winds which blow from the north and south of the line. To the east of that line, the direction of the winds varies between S.S.W. and S.S.E., and in the west it is between N.E.E. and E.N.E. These trade-winds do not begin to blow on the coast of the continents, but at a considerable distance from them.

It is to be attributed to the difference between the eastern and western hemispheres, as the sun is not observed to the thirteenth parallel; at this time the trade-wind encroaches considerably on the northern hemisphere, being found as far as the fourth degree of southern latitude. These trade-winds pass the equator all year round, except in January, when the region of trade-winds extends to a half degree of southern latitude. The central line of this region may therefore be placed at about five or five and a half degrees of southern latitude, and it may extend over five or five and a half degrees of latitude, or from 300 to 330 geographical miles. The calms which reign in this region would oppose an insurmountable obstacle to the progress of vessels, if the water were not so gently agitated by the trade-winds. The trade-winds appear towards the east, which seems to announce a violent storm; suddenly a wind rises, blows with great violence for a few minutes, sends down a few drops of rain, and then returns. This is the cause of several local storms which occur daily in this region. These dajuals suggest that there are two columns of trade-winds which are passed by vessels, but it always proves a very disagreeable navigation.

The trade-winds themselves are subject to change in their extent, according to the seasons, and in their direction, according to the different seasons of longitude. They withdraw farther from the equator when the sun is in the hemisphere in which they blow, and they occupy a wider range towards the coast of America, than at a short distance from the old world. In the seas bordering on the changes in the range of trade-winds, the diffusive range of latitude, and of the winds, but they always run in an opposite direction to the equator. They are observed in the Gulf of Guinea or Benin, and along the coast of Southern Africa to 35° S. lat., the wind does not materially differ from the southern trade-wind, blowing constantly from the south-west, or nearly so.

The general direction of the southern trade-wind by the continent of South America is considerable. Along the coast of Brazil a regular monsoon is formed, which between September and March proceeds from between N. 4° E. to N.E. 4° E., and from March to September from S.E. 4° E. to S. 4° E. This monsoon blows commonly with considerable force, and extends to a great distance from the shore, especially in the months of June and July, when it is at its height, at which time it would be admirably adapted to the navigation of the Atlantic Ocean. To the north of the equator the trade-wind does not undergo any change along the coast of America. This is probably to be attributed to the lowness of the coast of Guyana, and that of the extensive and frequent inundations of the Orinoco. It is even observed that in this quarter the trade-winds extend so far over the land, that their effect is felt at Angostura, 240 miles from the mouth of that river.

These are the winds which blow on both sides of the equator to the thirteenth degree of lat in the region of the perpetual winds. To the north and south of this region the winds are variable; but it is observed that westerly winds prevail in both hemispheres, and, according to the computation of Major Remell, the proportion between those that blow from the west to those from the east, is as 9 to 5 in the northern hemisphere. Besides being variable in direction, they vary likewise extremely in the degree of force with which they blow.

The currents of the Atlantic are less important than the winds, but still they contribute considerably to accelerate or retard navigation, and on that account deserve the greatest attention. But, as hardly sixty years have passed since the time when the first observations were begun to be made, the navigator as well as the geographer, and as the subject is involved, from its nature, in many difficulties, the information respecting them is not such as could be wished; still much has been collected, which is both interesting and valuable. In the western hemisphere it is hardly any considerable portion of the ocean which always remains still. The tides do not occasion an absolute removal of the water from one place to another, except near the coast; and even there this motion is limited to a comparatively small distance. But
besides the tides, two kinds of motion are to be distinguished in the sea, which we shall name with Major Rennell the drift-currents and stream-currents.

The drift-currents owe their origin to the effects produced on the surface of the sea by the perpetual or prevailing winds; the former, even where they do not blow with great force, by their uninterrupted continuance displace and push forward large masses of water in the direction of the wind, thus determining a motion towards the region to which they blow. These drift-currents are constant, and run always in the same direction and commonly with pretty equal velocity. The drift-currents produced by the prevalent winds are not necessarily continuous in the same direction, nor with the same velocity. In the Atlantic Ocean, the former kind of drift-current is found only between the tropics, where it is produced by the trade-wind; and the latter to the north of 36°, where they are ascribed to the effects of the prevalent winds.

The drift-current is, in some measure, observable all over that portion of the Atlantic Ocean which is under the influence of the trade-winds; but as these winds are not very constant to the north of the 23d parallel, and rarely extend to the south of the 9th, the current is constant only between these two boundaries. In the region of the calms it is very weak, and often entirely ceases. But in those cases where the calms subsist for a considerable time, the sea begins to be again perceptible and constant, except along the coasts of Africa, where it has rather a northerly than a westerly motion; the latter, however, becomes by degrees more prevalent in proportion as the wind takes that direction in addition. The mean velocity of the drift-current is from 9 to 10 miles per day, or, according to the computation of Humboldt, only one-fourth of the velocity with which rivers in Europe commonly flow on which observations have been made.

The stream-currents, which in the northern portion of the Atlantic is produced by the prevalent westerly winds, flows in a westerly direction; but it is not perpetual, and is so slow, that, when a ship keeps clear of the Gulf Stream, it only makes hardly any impression upon the whole course of a voyage from Europe to America and vice versa, retarding the former and forwarding the latter.

It is easy to conceive that the drift-currents, especially the permanent, are very favourable to navigation, by rendering the voyages to some countries more easy, more certain, and less dangerous. But the stream-currents are much less so. Up to the present time they have commonly proved adverse, causing great loss of life and property, and frequently derailing of their course. Many navigators, running southward from the coast of Madeira to the coast of Brazil, and by arriving at the latter island, have unexpectedly found their vessels cast upon the shores of Africa, nearly 300 sea miles out of their course. Such errors can only be detected by frequent astronomical observations, and by comparing them with the dead reckoning. If they are not detected in time, shipwrecks sometimes become unavoidable.

We cannot compare the stream-currents of the ocean with the rivers of the continents. The stream-currents over such a portion of the surface of the sea, that were they transferred to the continents, they would no longer be considered as rivers, but as large branches of the sea. The causes to which they owe their origin are still involved in obscurity; our observations have not yet penetrated into the depth of the sea,—they have only slightly investigated its surface,—and there are some facts which lead to the opinion that the stream-currents are of great depth, and in many parts, if not in all, extend to the bottom of the sea. This indicates clearly that their origin must not be sought in the changes which take place on its surface, and cannot affect the temperature, velocity, and temperature, their only properties which, up to this time, have been in some degree ascertained.

Large stream-currents traverse the Atlantic Ocean; the Equatorial Current, running from the coast of Africa to that of South America, and the Gulf Stream, flowing from North America to the shores of Europe.

The Equatorial current, so called from its course lying near the Line, may be supposed to be formed between the islands of St. Thomas and Anno Bom, in the bright or bay of Bamm. Hence it proceeds to the west on both sides of the equator, as far as 22° W. long., where it sends off a branch to the north-west. Soon afterwards it proceeds north-westward, and reaches the two capes of St. Augustine and St. Roque, on the Brazilian coast. At the distance of about 300 sea-miles from these capes, it divides into two currents; the northern, running along the shores of Guiana, and hence deriving the name of Guiana Current, thence divides into two branches by the straits which separate the Leeward Islands, lying to the south of Martinique, from each other and from the continent of South America; and in some measure contributes to form the Brazil Current, or the other branch of the equatorial current, runs to the south-west along the shores of Brazil, to the mouth of the Plata River, and may even be traced to the Straits of Magalhaens and of La Maire. The whole length of this current, from St. Thomas to Cape St. Roque, amounts to upwards of 2500 nautical miles; and if we add the Guiana current, from the point of division opposite that cape to the strait dividing the island of Trinidad from that of Grenada, its course is increased by 1500 nautical miles more. The breadth of the current is different in different parts. Near the islands of St. Thomas and Anno Bom, it extends not quite over three degrees of latitude, occupying about 160 miles. But, in proportion as it increases in breadth, it becomes weaker. Opposite Cape Palmas it extends from 1° 45' N. lat. to nearly 5° S. lat., thus occupying in breadth more than six degrees, or upwards of 360 nautical miles. Farther to the west it enlarges still more, and attains its greatest breadth, extending to nearly 10° or 11° S. lat. The breadth of this branch of the current is from 9 to 10 miles per day, or, according to the computation of Humboldt, only one-fourth of the velocity with which rivers in Europe commonly flow on which observations have been made.

The Equatorial Current may be considered as the strongest part of the ocean. It is but in the months of May, June, July, and August, that it runs with great force; from October to March it is moderate, and sometimes very weak. Between 16° and 23° S. lat., it runs with a pretty uniform rapidity, and is not capable of the seasonable changes which take place in the other parts of the ocean. As it is of great depth, it is not affected by the changes of season, and seems to be less affected by the seasons; but its velocity in these parts is not exactly ascertained; it seems, however, to run 30 miles and upwards per day. The temperature of the water in the current varies also, according to the seasons and the different parts of its course, but is always some degrees lower than that of the ocean.

The water of the ocean to the north of the current is 80° or 81° Fahrenheit, and to the south, 78° or 79° in summer; but in the current, the thermometer shows, near Anno Bom and St. Thomas, only 75°, and not more to a great distance westward, where the temperature falls even to 73°, and at this temperature it remains for more than 12° of longitude. Afterwards it rises again to 74°, and by degrees to 76° Fahr. In summer this temperature is lower, as it is estimated as being, at an average, 5° or 6° under that of the water of the ocean; but in winter it is much less. This current greatly affects the course of vessels which are passing from the north to the south, or from the west of the 23° of long., carrying them forcibly to the west beyond Cape St. Roque, where they are driven towards the northern shores of Brazil, and are not able to regain their place when they are driven towards the southern shores.

It is a fortunate circumstance that the direction of this current does not coincide with the region of the calms; otherwise, both together would probably form an impenetrable barrier to the progress of vessels navigating these seas. But the southern trade-wind commonly blows in that region.
where the equatorial current runs, at least during those months in which it runs with great force.

The Gulf Stream is known to be the warmest current in the world, where the warm water which enters it from the Caribbean Sea, between Cape Canaveral and Cape Saint. Antonio, by being subjected to a nearly circular rotation, and influenced probably by other causes, is raised to a high degree of temperature, the thermometer under the same parallel (25° N. lat.) the ocean only shows 76°.

Two currents, which put in motion perhaps three-fourths of the waters of the Gulf of Mexico, unite about 60 nautical miles south of Havana, where the trade-winds re-enter the Gulf of Mexico, and make the rock of Isabella on the side of Cuba, and the Tortuga on that of Florida Reefs; and this union gives rise to the Gulf Stream. In the beginning its course is not rapid, and along the shores of Cuba it is weak, and sometimes nearly imperceptible; but in a short time it appears to the eyes of the navigator as a setting of these two currents, which, entering the Strait of Florida at the Salt Keys, a reef lying 141 nautical miles to the north-east of Havana, and extends thence to the north, where it terminates between the reefs of Cape Canaveral and the northern termination of the Lesser Bahama Bank, at about 26° N. lat. After entering thisAmba Bank, and the Straits of St. Augustine, it enters the Gulf of Mexico, and occasionally 4 miles per hour; but after running at this rate for 90 miles, it arrives at the Narrows, where, between Cape Florida and the Bimini Islands (a small group of islands to the north), it loses all its force, and is only 44 miles wide, and its water-way, by reefs and shoals, is straitened to 554 miles. Here the current runs, in the month of August, at 5 miles per hour, and seldom below 5 through the remainder of the strait, which, towards its southern extremity, becomes wider, and about 30 miles. In this course the current has traversed about four degrees of lat. towards the north-west, and its temperature is not sensibly diminished.

Issuing from the Strait of Florida, the Gulf Stream runs northward along the shores of Florida to the Georgia, and afterwards nearly north-east along the shores of Georgia and of both Carolinas, as far as Cape Haters (about 35° N. lat.). In this course the current widens considerably in breadth, and decreases in velocity and temperature. Opposite the harbour of Charleston, it is wide from sixty to thirty-three miles; and at Cape Hatteras, from seventy-two to seventy-five miles. At the latter place it runs only three and a quarter miles per hour, or seventy-eight miles per day, and its temperature has fallen from 86° to 83°.

At Cape Hatteras, the north-western or inner edge of the current is twenty-four miles south-east of the cape. By the falling back of the coast north of Cape Hatteras, the current directs its western edge towards the north, thus increasing the breadth of the current. At about 46° N. lat., it meets the extensive Nantucket and St. George's Banks, which turn it off seaward, and it never after approaches the land. From the point it then runs nearly in a line with the southern extremity of the Great Bank of Newfoundland, and it continues in this line to 43° and 44° long., and 37° and 43° lat. Here, however, it bends by degrees to the east, south-east, and south, and having enclosed the islands of Flores and Corvo, which belong to the group of the Azores, its traces are lost in the water of the ocean.

Sometimes, though rarely, the warm water of the current extends to the shores of Europe. In this part of its course it is very strong, and is seen in all parts of the south latitude, where it is seen in all parts of the south latitude, and as far south as 45° 30'. This great length of the current, because the warm water expands to the north and to the south to a considerable distance in the sea, where no current can be traced; in the former direction to a degree, or a degree and a half of latitude; and on the southern side, to a degree and a half, it has been met with at 33° 30' and 34° 30'. The strongest current is commonly met with between 35° and 39° lat.; and it is the opinion of many intelligent navigators, that the breadth of which can not be called less than 100, 200, 300, 400, 500, or 1000 nautical miles. The warm water sometimes only extends to 140 miles, and then it seems to occupy only the current, but at other times it is found to cover 186, 240, 270, and even 320 miles. It does not seem that this difference in the breadth of the warm water is accounted for, as both extremes have been found to exist in the same month (May), between 63° and 65° long. It is probable that the main current does not always run in the same place, but

The second branch of the equatorial current is the Brazil Current, which branches off from the equatorial at 5° S. lat., opposite Cape St. Augutins, at a distance of about 350 miles to the east of it. Between the boundaries, where it branches off, and 16° or 17° of S. lat., it has considerable breadth, and does not approach the shores of South America nearer than 250 miles. Afterwards it increases in breadth and velocity, and approaches nearer the land. Opposite Cape Toro it is at 200 miles from land. Looking now to the north, the shore south of this cape falls off to the west, the current is at a greater distance; and though it soon changes its direction, it does not approach nearer than 250 miles to the coast, off the mouth of the Plata river, running all this way from 15 to 20 miles per day. It is crossed by the Pata river, just as the Guiana current by the Ambara river. Here too the current of the river is observable in the sea at a distance of upwards of 500 miles, but it seems not to have any sensible influence on the direction of the current, which continues, though much weakened, farther to the south, and may be traced to the Straits of Magalhaens and Le Maure. As this current runs at a considerable distance from the shores of Brazil, the navigation is never endangered. At times, however, the Lerma river, which mostly, however, follow the direction of the monsoons which blow along this coast.

The most remarkable, and at the same time the best

known of the Atlantic currents, is the Gulf Stream, which

traverses the sea between the parallels of 36° and 44° in

the northern hemisphere. Its course, which separates

from it between 22° and 23° W. long., and at about 26° N.

lat., is rather favourable to navigation, by forwarding the
course of vessels returning from the southern hemisphere.

In the Gulf Stream, in a migrant sea, it may be called

the Acclimated Current. Its breadth is considerable,

and may be estimated, at the point of separation, at

160 or 200 miles: farther northward, even at 300; and at a

more considerable distance, at 240 nautical miles; but its

velocity is much greater. It is known equatorial Harz, and

is known equatorial Harz, and

Up to 16° N. lat., however, and even a little farther, it may

run from 20 to 34 miles per day; but it then slackens, and

becomes less perceptible, though it may at all times be

traced to 18° N. lat., and commonly even to 25°. In the

latter part of its course, it is lost in the drift-current, to

which it seems to give a north-western direction, which is

observable all the way from 35° W. long. to Trinidad. The accelerated motion of the

drift-current in these seas may also, in some measure, be

the effect of this north-west current.

The Guiana Current is properly speaking, the continua-
ton of the equatorial current, and runs from Cape St.

Roque in Brazil, to the Island of Trinidad, along the low

coast of the latter, the velocity of the current is not

calculated, and of great velocity, running at some

places two miles per hour. Here too it is observed that

its velocity is much greater in summer than in winter and

approaches the same much more closely by the river

rising from the mouth of the Amazon river into the sea;

after this it has taken place, the current runs three miles

per hour. It is, however, to be observed, that the waters

of the Amazon river do not mingle with those of the

current; they cut through each other, and the two masses

separate, cause eddies and whirlpools; but at last the river

passes the current, and is observable at a distance of 500

miles from its mouth. It is remarkable that the Amazon

cameras are in the direction of the current. Farther to

the north, the Orinoco enters the current. This river, which

pours a prodigious mass of water into the ocean on both

sides of the island of Trinidad, enters the current at a very

acute angle; and thus soon mixes its water with it, and con-

siderably accelerates its course. Soon afterwards the current

enters the Caribbean Sea by the straits lying between Trini-
dad and the island of Martinique. Between Trinidad and

Grenada, it runs from 1 to 1½ mile per hour; less between

St. Vincent and St. Lucia; and between the latter island

and Martinique its course is reduced to 21 miles per day.

Farther to the north, and especially at the Virgin Island,

the sea-water runs only from 8 to 10 miles per day, and

that is the common rate of the drift-current. We find no

evidence whatever of the mass of the water of the sea, or

temperature from that of the ocean. It may be said that

the Guiana current is lost in the Caribbean Sea, for in the

latter no perpetual current has been observed. The whole

course of the Guiana current may be reckoned at about

2,450 nautical miles.
The Gulf Stream, being itself of considerable breadth, and covering besides with the warm water brought down by it large tracts of the sea on both sides of its course, forms a vast expanse of water on the surface of the ocean. It extends from the 30th meridian to the 70th, and sometimes covers in breadth at the east end all the sea from 33° to 45° N. lat., but at its western extremity it contracts to about 160 or 176 nautical miles. It is accordingly 2000 miles in length, and, at a mean, 350 miles in breadth, and thus forms a more extensive surface than the Mediterranean Sea. This body of water contains, besides the stream itself, its counter-currents, offsets, overflowings, and deposits, the cur-rateurs of the coast of California, the California Current, and the Mexican Sea may therefore be considered as a vast caudron for heating water, which is distributed over the central parts of the North Atlantic. It cannot be questioned that such a vast expanse of warm water, from 35° to 40° N. lat., and 45° to 55° N. lat., has a great effect on the surrounding sea and the adjacent countries. This point, however, has not yet been fully elucidated. It is only ascertained that the region of the Gulf Stream, more than any other part of the ocean, is subject to very violent storms, which are most frequent to the north of 35° and 35° N. lat. Further, it is not improbable that the mild climate by which the countries along the coast of the Atlantic Ocean are so favorably distinguished from those farther inland, is mainly due to the evaporation continually arising from the surface of this immense lake of warm water, just as the high temperature of the Mediterranean is supposed to contribute greatly to the very favorable climate of the countries bordering on that sea.

The Gulf Stream greatly affects the navigation of the Atlantic Ocean. Vessels bound from Europe to North America avoid it as much as possible, because it would create a delay of at least a fortnight if they were to steam it. They therefore either sail to the south or to the north of it, commonly the latter, their course being accelerated as soon as they approach the continent of North America by the counter-currents which run between the Gulf Stream and the coast of North America. These streams are now avoided by vessels returning from the West Indies, as well as by those bound to the Gulf of Mexico, though by following its course they arrive four or five days sooner in Europe than those which avoid it. But it has been found by experience that such vessels suffer a delay of a fortnight when they are not compensated by the gain of a few days. The Gulf Stream, for nearly the whole breadth of the Atlantic, is navigated through stormy latitudes; while it is only necessary to navigate one third of it when another course is chosen, and it is not the less dangerous for being veered. It was the ancient course of the old road, used before the discovery of the Gulf Stream, south of the Bermudas to Corvo.

Besides the Gulf Stream, two other currents in the North Atlantic deserve notice: the Arctic Current off the coast of African or Guinean Current. The Arctic Current, which seems to originate in the extensive masses of ice which surround the North Pole, runs down along the eastern shores of Greenland, whence it carries numerous ice-fields to the northern regions. These ice-fields, from the meridian of 63°, the thermometer shows 8° in summer, and from 41° to 11° above the water of the ocean under the parallel, after having traversed 4° of lat. Hence, to 42° lat. and 43° long., it loses 50° of heat, the thermometer falling from 8° to 0°. From 45° to 50° lat., the thermometer falls from 75° to 72°, still preserving a temperature 8°, 10° above that of the ocean.

Where the Gulf Stream brushes the Great Bank of Newfoundland, the warm water of the current is about 8° higher than that of the ocean, but the water of the ocean exceeds that which covers the Great Bank by 2°. These different degrees of temperature, though existing so near one another, can never attain an equilibrium, because each of them is a mass of water of the same temperature at the same time is permanent. To this difference of temperature, perhaps, the fog on the banks and the coast of Nova Scotia may be attributed.

The whole course of the Gulf Stream, from the Salt Keys to the Azores, amounts to upwards of 3000 nautical miles, in which course it traverses from 15° to 20° of lat. (3° to 48°, or 43°), and diminishes in temperature 13° (from 86° to 73°). According to Major Rennell, it arrives at the Azores in seventy-seven or seventy-eight days. The Gulf Stream, being itself of considerable breadth, and covering besides with the warm water brought down by it large tracts of the sea on both sides of its course, forms a vast expanse of water on the surface of the ocean. It extends from the 30th meridian to the 70th, and sometimes covers in breadth at the east end all the sea from 33° to 45° N. lat., but at its western extremity it contracts to about 160 or 176 nautical miles. It is accordingly 2000 miles in length, and, at a mean, 350 miles in breadth, and thus forms a more extensive surface than the Mediterranean Sea. This body of water contains, besides the stream itself, its counter-currents, offsets, overflowings, and deposits, the cur-rateurs of the coast of California, the California Current, and the Mexican Sea may therefore be considered as a vast caudron for heating water, which is distributed over the central parts of the North Atlantic. It cannot be questioned that such a vast expanse of warm water, from 35° to 40° N. lat., and 45° to 55° N. lat., has a great effect on the surrounding sea and the adjacent countries. This point, however, has not yet been fully elucidated. It is only ascertained that the region of the Gulf Stream, more than any other part of the ocean, is subject to very violent storms, which are most frequent to the north of 35° and 35° N. lat. Further, it is not improbable that the mild climate by which the countries along the coast of the Atlantic Ocean are so favorably distinguished from those farther inland, is mainly due to the evaporation continually arising from the surface of this immense lake of warm water, just as the high temperature of the Mediterranean is supposed to contribute greatly to the very favorable climate of the countries bordering on that sea.

The Gulf Stream greatly affects the navigation of the Atlantic Ocean. Vessels bound from Europe to North America avoid it as much as possible, because it would create a delay of at least a fortnight if they were to steam it. They therefore either sail to the south or to the north of it, commonly the latter, their course being accelerated as soon as they approach the continent of North America by the counter-currents which run between the Gulf Stream and the coast of North America. These streams are now avoided by vessels returning from the West Indies, as well as by those bound to the Gulf of Mexico, though by following its course they arrive four or five days sooner in Europe than those which avoid it. But it has been found by experience that such vessels suffer a delay of a fortnight when they are not compensated by the gain of a few days. The Gulf Stream, for nearly the whole breadth of the Atlantic, is navigated through stormy latitudes; while it is only necessary to navigate one third of it when another course is chosen, and it is not the less dangerous for being veered. It was the ancient course of the old road, used before the discovery of the Gulf Stream, south of the Bermudas to Corvo.

Besides the Gulf Stream, two other currents in the North Atlantic deserve notice: the Arctic Current off the coast of Africa, or the Guinean Current, which seems to originate in the extensive masses of ice which surround the North Pole, runs down along the eastern shores of Greenland, whence it carries numerous ice-fields to the northern regions. A T L

 Newfoundland in a northerly direction along the Labrador shore, generally preventing all access to land, as high as the mouth of the Hudson Street; then turning to the north-eastward, it forms a bay near the coast of Greenland in about 66° or 67° lat., by suddenly passing away to the eastward. This bay usually formed by the ice at 66° or 67° lat. does not always exist. The quantity of ice on each side of Davis's Strait is often small, and then the continuity of the ice-masses is liable to be broken, so as to allow ships to pass through on one side. It sometimes happens that the open up Davis's Strait to a considerable distance beyond the assigned latitude of 66° or 67°. After doubling Cape Farewell, the most southern promontory of Greenland, the ice moves along the east coast, sometimes enveloping Iceland as it proceeds, until it reaches the island of Jan Mayen. Passing this island on the N.W., but frequently encircling it, the edge of the ice then trends a little more to the eastward, and usually intersects the meridian of Greenland between the 71° and 72° lat. Having reached the long. of 8° or 8½° east, and in some instances as far as 10°, it changes its direction at once, and by suddenly stratching to the north, it forms nearly a right angle, or a kind of promontory. Hence it proceeds northward nearly in the same meridian as far as the 80th parallel, where it joins Hackluyt's Headland, and then passes southward along the coast of Spitzbergen to Cherry Island, which is between Spitzbergen and the North Cape. Here it turns to a more direct course a little to the south of east, until it forms a junction with the ice enclosing the island of Nova Zembla.

That remarkable promontory, midway between Jan Mayen and Cherry Island, formed the southernmost line of ice to the west, and constitutes the line of separation between the east, or whaling, and the west, or sealing, ice, of the fishers; and the deep bay lying to the east of this promontory and the west of Cherry Island, which may be called the Baffin's Bay, forms the only passage through the only pensive track for proceeding to the fishing latitudes northward. When the ice at the entrance of this bay occurs so strong as to comprise as to prevent the approach to the shores of Spitzbergen and the advance northward to lat. 75° and 76°, it is said to be a close ice, and, on the contrary, it is called an open season when an uninterrupted navigation extends along the western coast of Spitzbergen to Hackluyt's Headland.

In an open season, a large channel of water is left between the land and the ice, from 60 to 150 nautical miles in breadth, extending to lat. 79° and 80°, and gradually approaching the coast of Spitzbergen, until it at length effects a junction with the north-western extremity of it, or with Hackluyt's Headland. When the ice is interrupted between Greenland and Spitzbergen, it preserves its continuity to the south of the latter islands, proceeding from thence direct to Cherry Island. In a close season, on the contrary, it forms the barrier to the Baffin's Bight, and joining the south of Spitzbergen, forms a barrier against the fishing stations; yet this barrier is often of a limited extent, and terminates on the coast of Spitzbergen in an open space, either forming or leading to the retreat of the whales. This space, however, is sometimes frozen over until the middle or end of the month of May, but it is not unfrequently free from ice. The barrier which here forms a barrier to the fishers at the entrance of the bay, usually consists of a body of ice, from 60 to 120 miles in circumference, and is generally formed of smaller pieces of ice, called pack ice, often cemented into a continuous field by the intermixture of newly-formed ice. Behind this barrier the sea is commonly open up to 60°. Captain Parry, in his navigation to the North Pole, found it particularly for boats as far as 81° 19' 51"; and, in summer, this open space appears to extend to the north-eastern extremity of Spitzbergen. The barrier of ice which in a close season shuts up the Baffin's Bay, begins in March, and is most frequently in June, and then the sea is rendered freely navigable, from the very extent of the whales to the expansion of the Atlantic.

The ice changes take place in the ice of Hudson's Bay, Baffin's Bay, and Davis's Strait. The navigation of the former bay is first interrupted by ice, generally in the month of November; but on the east side of Davis's Strait it does not usually make its appearance under the land until
the spring. Little progress can be made through the ice into the great bays of Hudson and Baffin until the months of June and July, when a passage to the extremity of each bay is gradually opened. In the months of August and September the ice, lying in a very narrow belt, seems to be the most open, and in the Straits of Davis and Hudson almost entirely dispersed.

The ice met with in the sea between Greenland and Spitzbergen consists commonly of ice-fields, or pieces consisting of many ice-caps and ice-plains, which ice-fields being many leagues in length and covering an area of several hundred square miles. Ice-islands, or ice-bars, are also found; but they are neither so numerous nor so bulky as those of Baffin's Bay, where they attain an immense size: that which was described by Captain Ross and measured by Lieutenant Parry, was agreed in sixty-one fathoms: it was 4169 yards long, 3689 yards broad, and 51 feet high: its weight was calculated to amount to 1,928,397,573 tons.

It is very probable that the ice which is brought down by the Arctic current to the very centre of the North Atlantic, originates in the Bay of Baffin and the Strait of Davis; for it consists almost entirely of ice-bars. When the sun retreats towards the equinox, and the heat of this season becomes too great to maintain the ice in the West Greenland sea, they advance farther to the south and southwest, and are often met with in the Gulf Stream itself, between 56° and 46° W. long., and as far south as 44° N. lat., from the month of April to that of November. Some of them even here are of vast size, and all in a state of rapid thaw. They cool the water sensibly to a distance of 40 or 50 miles around them; and the thermometer sinks sometimes as low as 10 or 10 degrees, from 61° to 45° in 43°, in their neighbourhood.

In the southern hemisphere the ice does not advance to such low latitudes in any part of the sea. Captain Cook did not see any before he had passed the 50th or even the 52nd parallel; and Captain Weddell not before he reached 57½°. Captain Weddell having found it in a rather crowded state between 59° and 60°, to the north and south of that chain of islands which are known under the names of the South Shetlands and New Orkneys group, arrived to the south of 70° lat. in an open sea, where not a particle of ice was to be seen, between 37° and 40° W. long., and even at 74° 15' only a few ice-islands were met with. It therefore appears that the South Atlantic is much less encumbered with ice than the North Atlantic, probably because it is more exposed to southern gales.

Captain Cook observed, that the ice on the Antarctic Pole, in the South Atlantic, extended farther north than in the Pacific. Very few vessels, he says, met with ice going round Cape Horn, and very little is observed below the 44th degree of lat. in the Pacific. But between the meridian of 40° W. and 50° or 60° E., it advances as far north as 51°. He hence inferred the existence of a southern continent. But it is now known that the ice found at this latitude owes its origin to the chains of islands above-mentioned, and to the nearly destroyed ice-bars of the Antarctic Pole, and to the large pieces of ice that lie in the Indian Ocean, and occasionally are thrown out in the warmer season of the year, by Captain Biscoe (Geogr. Jour. &c.), and that to the south of it the sea is open and naturally free of ice.

It may be considered as a peculiarity of the Atlantic Ocean, that a considerable part of its surface is covered with sargasso, or Gulf weed, *fucus nitens*. The region of this weed extends nearly across the whole Ocean, beginning on the east on the 30th meridian, and extending on the west to the Bahama Islands. Its northern limit may be placed at about 28° N. lat. 3° W.; and its southern one at about 30° S. lat., and longitude 40° and 15° W. The region, however, is not equally crowded with weed: the greatest quantities being met with at the eastern and western extremities; on the east, near under the meridian of the islands of Cape Verde and Azores, the most western of the coasts of Africa; between lat. 50° and 60°, and long. 30° and 35° W., it forms first a narrow stripe, but, to the southward, expands to a great width. This region is called by the Portuguese Mar de Borgueses, or weedy sea. The quantity of the weed is really astonishing. It covers, like a mantle, the surface of the sea for many miles, and extends for more than 1200 miles from north to south. The western region extends between the parallels 22° and 28°, about the meridians of 70° and 72°, where the weed also is found in a very crowded state. The central division is less so; and it would even seem that in some parts the sea is only lightly strewn with it, whilst in others it is much more frequent. It is observed that the greatest mass of the weed is found at that part of the Atlantic where the Gulf Stream terminates; and the other great extent, where the counter-current of the Gulf Stream, which runs along its southern border, unites with the Bahama with the drift-current of the North Atlantic. Much of this weed is brought down by the Gulf Stream, and the Gulf of St. Lawrence, and of so great a quantity is so great, that it is reasonably supposed that most of it must be produced in the Atlantic itself at the bottom of the sea.

It is a known fact that the waters of the Atlantic Ocean, in different parts, contain different quantities of salt; and several persons have been at some pains to ascertain the amount of this difference, but no satisfactory results have yet been attained. We know only with certainty that the specific gravity of the sea-water is less near the poles than between the tropics and under the equator; but how great that difference remains uncertain. Captain Scoresby found the specific gravity of the sea-water near the coast of Greenland to be between 1'0325 and 1'0270; and others have observed on the west side of the Atlantic, by the equator even 1'0578; but the latter observation is rendered doubtful by others, which gave a different result.

Another remarkable fact, which has been better ascertained, is the small salt of the sea of the Baltic. The water of the Baltic and Mediterranean Sea is somewhat more salt than the ocean; to the east of the Straits of Gibraltar, the specific gravity of the sea-water is 1'0338; whilst between Cape St. Vincent and Cape Cavini it was only found to be 1'0324. As to the Banks and Fisheries in the Atlantic, see the articles *Newfoundland*, *Bermine Fishery*, *Wales Fishery*, &c.

(Humboldt's Travels; Rennell's Investigation of the Currents in the Atlantic Ocean; Account of the Arctic Regions by Scoresby; Voyages of Cook, Ross, Parry, Scoresby, and Weddell.)

**ATLAS** is the historical and geographical name of an extensive mountain-system, which covers, with its ranges, branches, and table-lands, the north-western part of Africa. The lower and southern parts, between 27° and 20° N. lat. from Cape Nun on the Atlantic Ocean to the Gulf of Canes, or the Little Syrtis, opposite the island of Jerba; the northern is formed by the southern coast of the Mediterranean Sea, and extends from the Straits of Gibraltar and Cape Bon, lying E.N. E. of the town of Tripoli, towards the east, and is separated from the western by its offsets and terraces along the Atlantic Ocean extending upwards of 600 geographical miles, and is partly low and sandy, and partly rocky, but does not rise to a great height, except at Cape Geer and a few isolated places of small extent. The coast along the Mediterranean between Cape Spartel and Cape Bon is generally rocky and high; in many places the elevation is very great, and it continues for a considerable extent. Between Cape Bon and the Gulf of Canes it forms a vast plain; and the neighbourhood is low, and it does not rise here to a great height, and is in many places interrupted by a flat sandy shore. From Cape Veda to the island of Jerba, along the Lesser Syrtis, it is extremely low and sandy.

The southern boundary of the Atlas is formed by the Great African Desert, or the Sahara: from which, as far as we know, it is separated by low sandy hills, which have been blown up by the winds, and which gradually encroach on the great mountain-systems, and the Atlas ranges terminate on this side. On the west of the Gulf of Cadiz, off the Nofucus Mountains, which are the last offset of the Atlas towards the west, are connected with the Gharhuan Mountains, which extend towards the S.E. through the kingdom of Tripoli, but do not extend westwards as not belonging to the system of the Atlas Mountains.

Within the boundary here assigned to these mountains is comprehended the whole of the empire of Fez and Marruecos, and that of the regency of Algiers, as well as the
greatest part of the regency of Tunis. The area of the
three countries may amount to upwards of 560,000 square miles, in
which case the Atlas system would cover a space not
much inferior to France, Germany, and Italy, taken together.
This vast extent of country, however, does not consist
entirely of deserts, but includes part of a considerable
plain, which, especially towards the northern
coast, is of considerable extent, and even amongst the
mountains ranges along the Mediterranean there are
many extensive plains.

The principal chain, by which we mean to indicate the
highest ranges of the whole system, does not run parallel to
the whole mountain-region from west to east, but forms
rather an irregular and winding diagonal, whose principal
direction is west-south-west, or rather south-south-
west, to the coasts of the Mediterranean Sea and
the shores of the Atlantic Ocean with Cape Gerir, which rises
nearly perpendicularly out of the sea to a great elevation,
and extends nearly due east to the meridian of the city of
Marocco, where it turns to the E.N.E., in which direction
it continues to the south coast, the Wad Oum-er-rbah (Morbyen),
Muluia or Muluvia, (the ancient Molochia, or Mol Bucha), Ziz or Tellhit, and Draha (Dras).

At this place there seems to exist an extensive mountain
range, which contains, as far as we know, the highest summits
of the whole system. The greatest range stretches hence
nearly due north, but soon declines somewhat to the east,
in which direction it approaches the Mediterranean. But
these and the ranges westwards near Melilla, it is not the principal range; for this,
which is at a considerable distance from the sea, seems to
decline to the east, and to traverse the almost unknown region
designated by the name of the Desert of Angad, through which
there can be but little information as to the height or shape
of the mountains, and Algiers passes. The chain, up to this point, is called
by the Europeans Greater Atlas; by the natives, Derar, or Jebel Tedri (Adila). The principal chain again appears
in the town of Algiers, where the highest part bears the
name of Wn-nan-sheere, and from this point the
mountains continue on the banks of the Shekil, the valley of which river probably interrupts the
continuity of the range. To the east of it, however, it rises
again, and forms, south-east of the town of Algiers, the
highest known range, the Taur or Taur Mountain. Up to this point
the range runs nearly parallel with the sea-coast, at a
distance of from thirty to forty miles. But hence it declines somewhat
towards the S.E., and takes the names of Mountains
of Wnunnough and of I ala. Further to the east, at about
5° E. long., it is called the Aures Mountains; and here it begins to approach the coast again, entering, under the
name of the Mountains of Tifers or Tifissh, the territory of
Tunis; it terminates with Cape Blanco and Cape Zibech, near
the mouth of the river Oum-er-rbah.

Little is known respecting the height of these mountains.
Only one summit has been measured, the Militain, twenty-seven
miles S.E. of the town of Marocco, which is free from
snow only once in about every twenty years, and, according
to the measurement of Lieutenant Washington, rises to
11,496 feet above the level of the sea. It is further agreed,
that the highest summits of the whole range are in the
mountain-knot, near the sources of the rivers Oum-er-rbah and
Muluvia, where a considerable part of the chain is always
covered with snow. These summits are estimated by Ali Bay to rise 13,200 feet above the sea, but Graber of
Henske thinks that Mount Hestet attains the highest
elevation, being upwards of 11,650 feet, and that the range
in this general direction is the Alperg Mountains described
along the Mediterranean, which commonly receive the
general name of Lesser Atlas, are much lower. Shaw states
that those of Wn-nan-sheere and Jurjura are the highest,
and covered with snow a considerable part of the year; and
the French naturalist, Desfontaines, assigned to them a height
of 7,900 feet. Farther to the east they decrease considerably
in elevation.

We observe, with respect to the principal chain, that up
to the point where it enters the desert of Angad, it forms
the line of separation between the Atlantic Ocean and those
that run north and south into the Medi-
terranean Sea, or the Sahara. The Lesser Atlas, however,
does not form such a line of separation between water-
sheds as the previous part of the chain. This important part, in
which enter the Mediterranean rises to the south of it in a
lateral chain, which runs nearly parallel to the principal,
and makes their way through the latter.

The best known of the lateral chains is that which may
be considered as the western continuation of the Lesser
Atlas; it probably separates from the principal range where
it enters the desert of Angad, and runs along the shores
of the Mediterranean Sea at a distance of about thirty
miles, being a mountain range of about 11,000 feet.

The cha
t is thought to rise only to about 23,000 feet above the sea
in the highest part, and is the only one which traverses
the exposed country rising to a great elevation.

The numerous branches which lie to the south of the
Lesser Atlas, and cover the country between it and the
Great Desert, are very imperfectly known as to their height,
extent, and connexion with one another. It would seem
that the most considerable of these large rivers (the Shekil, Seifoune, and Mejendra) take their origin,
and which contains the Zacker Mountains, is the
highest, and that they lower as they approach the Sahara.

This fact we may infer from the statement of Bilhan,
who, however, observes, that these mountains do not attain
the height of those of England, rising at an average only to
four, five, or six hundred yards of perpendicular elevation.

One branch separating from the principal chain and ex-
tending towards the Sahara, runs south-west, and terminates
at Cape Nun. It divides the country about the rivers Suse
and Wed Messa, which flow into the Atlantic from the
region drained by the river Draha, which is absorbed in
the desert. It is not very known, but probably rises only to a moderate height.

As the Atlas Mountains have been traversed by very few
Europeans, and have never been subjected to the ex-
atual of naturalists, their geology is nearly unknown.
There is, however, some information respecting them,
that fact, that the lower skirts of the ridges are formed by
secondary limestone, and that this formation probably
covers the mountains to an elevation of three or four
thousand feet. What constitutes the structure of the
mountains is unknown. No traces of volcanic activity
have yet been discovered. As to the more striking features
of external form, it is generally agreed, that they differ
considerably from the Alps. The Atlas does not exhibit
the characteristic features, and stands out in a more
pronounced manner; everywhere shows a decided tendency to extensive table-
lands, broad ridges, and rounded summits. On each side of its declivity the range supports two, three, or more
large table-lands, at different elevations above the level of
the sea, and separated from one another by rather steep slopes.
The summit of the range, however, is formed by great masses of rock which are generally inaccessible, or nearly
so; in many places they rise perpendicularly. In a few
places these summits are rock pavements, through which the mountain passes lead from one side to the other.
Jackson states that only two such passes exist between Marocco and the province of Suse, and he calls them Bebavan and Belavin; the difficulty of
passing through the range, is heightened by the fact that the
majority of the provinces situated to the south and south-east of the principal chain precarious to the emperor of Marocco. This
description applies more particularly to the Greater Atlas;
but in part also to the Lesser Atlas: Shaw states that the
mountains in Algiers generally rise with a gentle acclivity,
and are covered with a succession of groves and ranges of
fruit and forest trees, and that only occasionally a rocky
precipice of more difficult access occurs. Yet he notices in
some parts a number of steep and precipitous passes, as the mountain-pass of Beevan, through which the
great road between the town of Algiers and of Constantina
lies. It would seem that this peculiarity in the form of
these mountains offers one of the greatest difficulties which
the French have encountered, and are still encountering, in
subjecting the territories of Algiers.

As the Atlas Mountains, in some places, rise above the
line of perpetual congelation, and in many others approach
this line; and, at the same time, the southern declivity
embraces the important town of Lixus, and the
Great African Desert, where the greatest quantity of heat
developed on the surface of the globe, it is of course to be
presumed that on the sides of the Atlas the greatest extremes
of temperature are found. The inhabitants who desires
of this kind has yet been made. We only learn from travellers that on the low plains at the southern foot
of the mountain, and within its lower ranges, the date-

Vol. III. - F
palms cover extensive tracts; that the highest lands abound in gum trees, almonds, olives, and other productions of the hotter countries; that the lower table-lands produce apples, pears, cherries, walnuts, apricots, and other fruits, common to the southern countries of Europe; and that, proceeding higher up the river, the plains are covered with hay fields and meadows, an immense sere, with a species of oak, called the beludie, the acorn of which is used as food, and is preferred to the Spanish chestnut, and with ferns, elms, mountain-ash, and several species of juniper. Higher up large forests of fire trees and yew prevail.

The metallic richness of these mountains is better known than the botany. Rich mines of different kinds exist in that lateral range which separates the province of Tunis from the country of the river Drera; these abound, especially in iron, copper, and lead. Kutemwa, a district east of Tarudant, contains rich mines of lead and brimstone; and salt-pans of a superior quality abound in the neighbourhood of Tarudant itself. About fifty or sixty miles south-west of that town are mines of iron of a very malleable quality, equal to that of Basay, in Spain. At Elata, in the same ridge of mountains, are several rich mines of copper, some of which are impregnated with gold; and in the same place there is also a rich silver mine. Mines of antimony and lead are likewise found in Suse. In the bed of the river Wad Medessa, particles of silver may be collected. In other parts, as in the Lesser Atlas, mines of iron, lead, and sulphur are found. Salt is collected in many parts of the same mountain system. These mountains are inhabited by lions of the finest kind and the largest size; and they abound in antelopes, monkeys of different species, and in porcupines: but their soil is not very well cultivated.

Having taken a general view of the principal features of this extensive range, we shall briefly describe the nature of the countries which may be considered as included in its bounds.

The countries to the south of the principal range, and west of the meridian of London, may be divided into two regions, one of which contains the provinces of Tafilalt and Draha, and the other the Susse. The first belongs to that region which is called Bokhodj, in the Arabic tongue, Belad el Jered (land of dates), and extends along the southern declivity of the whole system. It consists of gently-inclined plains, which spread to the foot of the mountains, but do not produce any thing adapted to the maintenance of human life; it is only on the banks of the few rivers, whose water is strongly impregnated with salt, and which lie themselves in the sands of the Sahara, that large groves of date-palms are planted; the fruit of the date, with dates, horses, and cattle, are the sole wealth of the few inhabitants in this region.

The provinces of Susse is divided from that of Draha by a range of mountains, and displays quite a different character. It is well watered, and abounds in every sort of agricultural produce, and especially in dates; its plantations of dates are numerous, and those of olives still more extensive. The country may be considered as a plain with some small hills dispersed upon it.

The country included by the Greater Atlas, by that lateral branch which terminates on the Strait of Gibraltar, and by the Atlantic Ocean, may be considered as a plain, which exhibits at its southern and northern extremities extensive level and low countries; its centre, between the rivers Beni Bernard and Ghorbi, is occupied by an elevated table-land, which descends in regular steps to the seashore. The distinguishing features of these three divisions will be given under the article MAROCCO.

The countries to the east of the principal chain display a much greater diversity in their nature. They may be divided into two parts, of which the northern comprehends the Tafilalet, or the land adapted to agriculture; the southern is partly comprehended under the name of Belad el Jered, though in a greater, it is termed by the natives the Sahara, which name cannot be applied to it in the sense in which that term is understood in Europe.

The Tafilalet comprehends all the countries which are watered by the river falling into the Mediterranean. Its northern branch contains the two important rivers Littau and Ouezzane, which both flows into the sea at Cadiz. The countries which are watered by the river flowing into the Sahara are the provinces of the Garg, and presents only a succession of mountains, deserts, and narrow valleys, without any plain of considerable extent or surface; except between the Capes of Mess Accon and Cape Matia, on both sides

and to the south of the town of Algeciras, where the country exhibits only moderate hills rising on a rather level country. But to the south of the Lesser Atlas, and between it and the mountains in which the large rivers take their origin, the country extends in large level plains along both sides of the valley, the river running over marshy grounds, covered with all sorts of plants, some of which are particularly adapted to the cultivation and horticulture. Such are those of Hijjajita and Mestijjah, and the country about the large town of Constantine, as well as that of Mejerda, in Tunis, and many others: they form the most fertile and best cultivated part of these countries.

To the south of the Tafilalet lies a country, which, in many respects, may be considered as one of the most remarkable on the surface of the globe. It consists of a succession of hills and plains, entirely covered with a level soil, which is watered by the lake in their hollows—the receptacle of the waters that flow down from the adjacent mountains. It would seem that such valleys extend from the low shores of the Lesser Syrtia, through the whole region, up to the chain of the Greater Atlas; and doubtless they rise in height as they proceed toward the west. The most eastern of these closed valleys is that of the lake called Shikhab el Loeedah (properly Sabkhat al-Audah, i.e. the salt marshes of the valleys), the Triumons of the ancient geographers (the Lake of the Marsh), which is separated from the Lesser Syrtia by a sandy tract of apparently no great elevation, and to the south east of which, at no great distance, are the Nofuss or Nisfous Mountains, the most eastern branch of the Atlas system. The whole tract is traversed by a river, which in some parts is lost altogether in a collection of water, there being several dry tracts interspersed all over it, which look like so many islands. In the dry season the water entirely disappears, leaving only the bottom of the lake visible.

Having taken a general view of the principal features of this extensive range, we shall briefly describe the nature of the countries which may be considered as included in it in its bounds.

The countries to the south of the principal range, and west of the meridian of London, may be divided into two regions, one of which contains the provinces of Tafilalt and Draha, and the other the Susse. The first belongs to that region which is called Bokhodj, in the Arabic tongue, Belad el Jered (land of dates), and extends along the southern declivity of the whole system. It consists of gently-inclined plains, which spread to the foot of the mountains, but do not produce any thing adapted to the maintenance of human life; it is only on the banks of the few rivers, whose water is strongly impregnated with salt, and which lie themselves in the sands of the Sahara, that large groves of date-palms are planted; the fruit of the date, with dates, horses, and cattle, are the sole wealth of the few inhabitants in this region.

The provinces of Susse is divided from that of Draha by a range of mountains, and displays quite a different character. It is well watered, and abounds in every sort of agricultural produce, and especially in dates; its plantations of dates are numerous, and those of olives still more extensive. The country may be considered as a plain with some small hills dispersed upon it.

The country included by the Greater Atlas, by that lateral branch which terminates on the Strait of Gibraltar, and by the Atlantic Ocean, may be considered as a plain, which exhibits at its southern and northern extremities extensive level and low countries; its centre, between the rivers Beni Bernard and Ghorbi, is occupied by an elevated table-land, which descends in regular steps to the seashore. The distinguishing features of these three divisions will be given under the article MAROCCO.

The countries to the east of the principal chain display a much greater diversity in their nature. They may be divided into two parts, of which the northern comprehends the Tafilalet, or the land adapted to agriculture; the southern is partly comprehended under the name of Belad el Jered, though in a greater, it is termed by the natives the Sahara, which name cannot be applied to it in the sense in which that term is understood in Europe.

The Tafilalet comprehends all the countries which are watered by the river falling into the Mediterranean. Its northern branch contains the two important rivers Littau and Ouezzane, which both flows into the sea at Cadiz. The countries which are watered by the river flowing into the Sahara are the provinces of the Garg, and presents only a succession of mountains, deserts, and narrow valleys, without any plain of considerable extent or surface; except between the Capes of Mess Accon and Cape Matia, on both sides
but still within the southern lower ranges of the Atlas system, lies a long valley without any water-source, which seems to extend up to the foot of the Greater Atlas. The greatest part of this valley is entirely unknown to us. Shaw has given some information on the eastern portion of it, called, Wad marq, which is covered with a great surface of aerated, and of another branch of it, in which the town of Warghoul is found. No river traverses this country; but by digging wells to the depth of a hundred and sometimes two hundred fathoms, a plentiful stream is always found. These wells are depressions of sand and gravel, a flaky stone-like slate is reached by the workmen, under which the sea underground, as it is called, lies concealed. No sooner is this stone broken through, than it is followed by a great rush of water. These seem to be such wells as are necessary to be provided with in a country without rivers. The further continuation of this valley to the west up to the Atlas is entirely unknown to us, and its existence is only proved by the caravans, which depart from Fez and Marrakesh for Mekna, and choose this country for the usual road of their journeys; from which we may infer that no ranges of considerable height are encountered in those parts. Warghoul, Fez Fighaig, and Akasa Sarfa are named as the principal stations of the caravans in this valley. (Shaw's Travels; January 1865, p. 330.)

"The native name of these mountains, according to Pliny (v. i.) and Strabo, was Duris; the reader may see in this excellent writer this name. It does not appear that the ancient geographers had a very complete knowledge of the Atlas; but still the Romans probably knew more about it than we yet do, having colonized many parts of the country which these mountains and their branches occupy. As far as we can collect, it was only the highest and western part, in the kingdom of Marrakesh, to which they applied the term Atlas; and they do not seem to have extended the name to the high lands to the east so far as the Atlas at Fez. Pliny, who was contemporary with Pliny, was the first Roman commander who crossed the Atlas. His report of their great height agreed with all that had up to that time been said of them; he found the lower parts of the range covered with trees and bushes, and the summits with deep snow in the midst of summer."

The text continues discussing the geography and climate of the Atlas Mountains, mentioning the presence of caravans and the conditions of the land. It also touches on the influence of the Atlas on the local culture and economy, though the page does not provide explicit details related to the question.
The preceding table was deduced from various observations. It will serve to show how far the temperature of elevated regions on the earth agrees with that of the same height in the atmosphere. From the preceding, the first column is the height of the land above the level of the sea (in metres); the second, the mean temperature (centigrade) at and near the equator; the third, the same at about 45° of latitude. The thermometer used is the centigrade; (+) means above, and (−) below, the freezing point.

From the preceding table, it appears that at the equator, on the average of 4872 metres, a rise of 187 metres gives a decrease of 1°, or 1° centigrade, and a rise of 1° centigrade produces a fall of 1°. With the same height of elevation, an elevation of 214° produces a fall of 1°; but from 2923° to 4872°, an elevation of 152° does the same.

The argument in favour of the finite extent of the atmosphere, derived from the character of the atmosphere in the higher regions, is not weakened by the fact that the earth is not homogeneous in its constitution. If we suppose an elevation of 200 yards to produce a fall of 1° of Fahrenheit's thermometer (which, as we have seen, is likely to fall short of the truth), that is, to give the higher regions of the atmosphere a higher temperature than they really have; it follows, that at a height of forty miles above the earth, the temperature of the air must be 350° of Fahrenheit below that of the sea, or certainly more than 300° below the freezing point.

The strongest argument in favour of this view is the following. If we were to suppose homogeneous air, it would be impossible for it to exist in that state at this low temperature, but would become liquid: and though no gas has yet been rendered liquid by reduction of temperature, yet several have been reduced to that state by cold and pressure united.

If, then, we suppose the atmosphere of finite extent, its form must be nearly that of an oblate spheroid, the lesser axis passing through the poles of the earth; at the same time the action of the sun and moon must produce certain small atmospheric tides; and the tides of the sea, which are produced by the action of the sun and moon, under the influence of the rotation of the earth, must produce periodical alterations of form in the latter also.

If any such exist, they may be detected by the barometer; for, ceteris paribus, any increase of the height of the superincumbent column of air must be accompanied by a small increase of the barometer, or a balancing of the column of mercury.

Laplace was the first who examined this curious branch of the subject. He showed by analysis that the attraction of the sun and moon could produce no permanent effect upon the currents of the atmosphere; for instance, such as the trade-winds.

He also showed that the diurnal oscillations caused by the above-mentioned attractions would only produce a very small effect upon the barometer, in fact, less than one millimetre; and that the number of oscillations in one day would be about 24. The reduction of a large number of observations gave, at first, 0.065 of a millimetre for the quantity in question; those of another set gave 0.018; from which Laplace concluded, taking into account the smallness of the quantity and the degree of probability which could be attached to results of different, that the sensible existence of the atmosphere tides was doubtful.

In the meanwhile, however, the diurnal variation of the barometer has been completely established by observations made in several different places. The laws and quantity of this oscillation appear to vary so much with latitude, climate, and other circumstances, that no positive conclusion can yet be drawn, either to the exclusion of atmospheric tides, properly so called, or the adoption of any other cause in connection with them. Professor Forbes, of the British Association, p. 319, has discussed all the observations, and has given a formula which represents them tolerably well.

The average pressure of the atmosphere is found to be the same, or very nearly so, at any one place from year to year.
height ascended. The method of doing this will be explained in the article Heights (Measurement of); we notice it here in order to mention a circumstance which must be observed, that our knowledge of the mass of the atmosphere has not been overstated. In order to construct the formula, it is necessary to take into account the diminution of the weight of the air, not only from its evaporation, but also from its lightness being greater nearer the earth,—the diminution of the effective weight of the atmosphere, and, therefore, the diminution of the elastic force, as well as the effective weight of the air; and the change of temperature,—the alteration of density in the mercury itself, arising from the alteration of temperature,—and to use the formula in different latitudes, the variation of the effective weight of the air. The process of finding the temperature is a little lengthy; but it is a good test of our knowledge of the height of the atmosphere, and also of the process; and as a verification, recourse is had to the comparison of heights measured by the barometer, and also by the processes of trigonometry. It is thus found that the co-efficients of the air, when deduced from theory alone, is 1832746, appears from a number of observations made trigonometrically to be 183366, differing from the former only by about its 10,000th part. This shows the effect of temperature to be sufficiently well taken into account, for such heights as we can measure, by the preceding position.

In the article Air some reasons were shown for supposing that its component parts were not united chemically, but only mixed. This opinion, which is now almost universally adopted, has given rise to the use of notions on the constitution of the atmosphere, differing entirely from those of all chemists down to the present day. A law is found to prevail in the mixture of gases and vapours, as universal as the one described in the article Air, relative to the pressure of the atmosphere—namely, that two gases in a state of mixture exercise no influence one upon the other, except communication of temperature, but that each is exposed in exactly the same manner as it would be if the other were not present. This is found, entirely contrary to all previous notions, that no pressure of dry air upon water exerts the least influence in preventing the formation of steam, which goes on exactly as if the space above were a vacuum, and continues until further evaporation is stopped by the pressure of the steam already created. It is found that no pressure of one gas can confine another in water; but that a bottle partly full of water, the gas confined in the water will escape to the surface and distribute itself in precisely the same way as if the other gas were not present. By this it is not meant that the action commonly called mechanical cannot take place, or that a stream of hydrogen would not trouble the air; but only that the permanent settlement of a gas in the air is not affected by the presence of another, so long as no chemical action is excited. From this principle, Mr. Dalton (Phil. Trans., 1828), taking into consideration the presumptions which exist against the chemical union of the ingredients of the atmosphere, infers that the atmosphere does not consist of a compound air, but that the nitrogen atmosphere is higher than the oxygen atmosphere. In fact, if there be no chemical union, the above law of the mixture of gases requires us to allow that each gas is an atmosphere independent of the other, and that the two are most probably of unequal heights. From some considerations, into which we cannot here enter, Mr. Dalton thinks that the actual pressures exerted by the oxygen and nitrogen are in the proportions of 13 to 46 of the total; and concludes that the oxygen atmosphere extends to 36 miles in height, that of nitrogen to 54 miles, that of carbonic acid to 10 miles, and that of aequos vapour to 80 miles. It must be observed that the pressure of the nitrogen and the carbonic acid of the atmosphere are very variable, that there is not the same quantity by night as by day, in moist weather as in dry; and that the higher strata of the atmosphere contain more of it than the lower, which may arise from rapid evaporation by the earth. Against the hypothesis just described, it might perhaps be asserted that the air which Gay-Lussac brought down from a height of more than four miles was not found to differ from that of the earth’s upper strata, which would be the case if the oxygen atmosphere diminished in density more than in proportion to the diminution of that of the nitrogen, or
vice versa. We do not know whether the experiment of M. Gay-Lussac was made, or even intended to be made, with that degree of precision to satisfy its hypothetical views. The theory of Mr. Dalton's theory: but in any case it is an experiment which it is very desirable to repeat.

The total quantity of the atmosphere (as the mean height of the barometer at Paris hold good for all other places) is a little less than 7 miles, and this proportion is probably made up of nearly all the air on earth, supposing the mean density of the latter to be five and a half times that of water. (Poison, Micaciiique, 2d edit. vol. ii. p. 610.)

For the colour of the atmosphere, see SKY. For the quantity of moisture contained in it, see HYDROLOGY.

For the history of atmospheric researches, see the following names, HERON, CRESIBUS, GALLERIO, TORRICELLI, PASCAL, FLORENCE (Academy of), BOYLE, MARIOTTE, PAUSSON, BLACK, DESLAURES, CAYRENDI, &c.

The actual constitution of the atmosphere, whether composed of molecules exerting a repulsive force upon each other or not, must remain unsettled until some mathematical hypothesis can be found which shall satisfy all observed phenomena. That probabilities are at present all on the side of the molecular or atomic hypothesis, is pretty generally admitted; and the repulsion of the several parts of air is a fact of every-day experience. Newton entered upon the subject with a heretical atomism, and said that if the constitution of the atmosphere were atomic, and if the force exerted by each particle extend only to those nearest to it, and be either nothing or inconsiderable as to all others, then that the observed proportionality of the elasticity of the different strata of air has no hypothesis except that of a repulsive force inversely proportional to the distances of the particles from each other; that is, which becomes double when the distance is halved, and so on. But in the scholium to the same proposition, he takes notice of the imperfection of the hypothesis, and describes his theory as a mathematical 'handle' to induce philosophers to consider the subject further. The molecular theory, on the supposition that every particle repels all the rest, or, which is the same, if each atom be considered a sphere, and repulsion, is beyond the reach of the present state of mathematical analysis.

For the state of atmospheric knowledge up to 1868, see Robertson, General View of the Natural History of the Atmosphere, Edinburgh, 1868; from thence to 1822, see Daniel's Meteorological Essays, London, 1822; and for an account of what has been lately done, with further references, see Professor Forbes's Report on Meteorology, in the Reports of the British Association, London, 1832.

ATOMIC, or ATOLLON, is a name given by the natives of the Maldives to the detached coral formations of which their Archipelago is composed. They are commonly of the form of a small solid island, or ring, from fifteen to thirty miles in diameter, and rise perpendicularly from an unathomable depth. The openings which occasionally occur in these reefs afford passages for vessels, and safe anchorage is found in many within the circumscribing wall; the space thus included is often interspersed with islands. The principal of these islands, however, are always situated on the outer reef; they abound in coral-reef, and are long and narrow. In short, they are very similar to the coral formations of the South Seas, though generally on a larger scale; the name ATOLL is exclusively used among the Maldive.

ATOM, or ATOMS (Johns), the ultimate and indivisible elements of matter, from a Greek compound, signifying undividable. Anaxagoras, the ancient philosopher of 425 B.C., imagined the number of elements to be nearly as it is absolutely infinite, and that the ultimate atoms composing every substance were of the order of 100,000. [See Anaxagoras.]

Leucipus, a philosopher of Athens, lived about 440 B.C.; he was the first to think of the atomic theory. His principles were taken up by Democritus, in his Conomogey; and afterwards by Epicurus, whose system of atomic theory is chiefly owing. The following account of this doctrine is copied from Dr. Good's Book of Nature, and is a clear and concise sketch of the theory contained in the writings of Epicurus and his followers. The atomic or Epicurean philosophy of Epicurus, in its mere physical contemplation, allows of nothing but matter and space, which are equally infinite and unbounded, which have equally existed from all eternity, and from different combinations of which every visible form is created. These elements, which are infinite in number, are hard and unyielding; they are indivisible; other: for whatever matter is, that space is the reverse of; and whatever space is, matter is the contrary to. The actually solid parts of all bodies, therefore, are matter; there are no pores in them; and the pores, together with solid, but an intermixture of solidity and pore, are space and matter combined. Anterior to the formation of the universe space and matter existed uncombined, or in their pure and elementary state. Space, in its elementary state, is absolute; and perfect space is it which is in the indecomposity and incommensurably minute seeds or atoms so small, that the corpuscles of vapour, light, and heat are compounds of them; and so solid, that they cannot possibly be broken or abraded by any concussion or violence whatever. The express figure of these primary atoms is various: there are round, square, pointed, jagged, as well as many other shapes. These shapes, however, are not diversified to infinity; but the atoms themselves of each existent shape are infinite or numberless. The matter of all motion is produced by the lesser or greater powers of motion. Under the old school of Democritism, the hypothesis of perpetual motions hence produced were of two kinds: a descending motion, from the natural gravity of the atoms; and a rebounding motion, from collision and mutual clash. From these two motions, and the compounding of figures to which they did not appear competent, and which were not accounted for under the old system, Epicurus supposed that some atoms were occasionally possessed of a third, by which, in some very small degree, they descended in an oblique or circular direction, deviating from the common and right line anomalously; and in this respect resembling the oscillations of the magnetic needle.

These infinite groups of atoms, flying through all time and space in all directions of alternate motion, have interchangeably tried and exhibited every possible mode of renounter; sometimes repelled from each other by concussion, and sometimes adhering to each other from their own juggled or pointed construction, or from the casual interstices which two or more connected atoms must produce, and which may be just adapted to those of other figures, as globular, oval, or square. Hence the origin of compound and visible bodies; hence the origin of large masses of matter; hence, eventually, the origin of the world itself. When these primary atoms are closely compacted, and but little vacuity or space lies between, they produce those kinds of substance which we denominate solids, as stones and metals; when they are loose and disjunct, and have a large quantity of space between, you have gases or starchy bodies. When these atoms are very rare and dispersed, you exhibit bodies of lax texture, as wool, water, and vapour.

The world, thus generated, is perpetually sustained by the application of fresh titules of elementary atoms, flying, in a perpetual communication, through all the infinity of space, invisible from their minuteness, and occupying the portion of those that are as perpetually flying off. Yet nothing is eternal or immutably but these elementary seeds or atoms themselves. The compound forms of matter are continually decomposing and dissolving in their original corpuscles, and to this there is no exception: minerals, vegetables, and animals, in this respect, are all alike, when they lose their present make, perishing for ever, and new combinations proceeding from the matter into which they disperse. But the world itself is a compound thing, not an organized being; sustained and nourished, like organized beings, from the material substratum that floats through the void of infinity. The world itself must, therefore, in the same fashion perish; it had a beginning, and it will have an end. Its present state will be destroyed, and that by the decay of its original, its elementary atoms; and new worlds will arise from its destruction.

Space is infinite, material atoms are infinite, but the world is not. If the void of space is the only material system that exists. The cause that has produced this visible system is competent to produce others: it has been acting perpetually from all eternity; and there are other worlds, and other systems of worlds, existing around us. During the most flourishing periods of the Greek phi
ATOMIC THEOREY, in chemistry, sometimes termed the doctrine of definite proportions. This very important theory, founded on well-ascertained facts, has bestowed on modern chemistry an almost mathematical degree of precision. The hypothetical, which is to be distinguished from the experimental part of the subject, supposes that chemical compounds result from the combination of the ultimate atoms of the elements distinguished and determined by experiment, and the fact serves as the basis of the theory, that a compound body, when pure, always contains the same proportions of its constituents: thus calcareous spar, and the pure part of marl, chalk, and limestones, consist of carbonate of lime and carbonic acid; the same proportions of carbonic acid and lime; the carbonic acid always contains the same quantity of carbon and oxygen, and the lime the same proportions of calcium and oxygen. The same law holds for all simple and compound oxides, sulphures, and salts, and indeed as to all chemical compounds whatever, whether presented to us by nature or formed by art: this is a simple statement of the fundamental facts upon which the superstructure of the atomic theory has been reared.

Before we proceed to detail the minutiae of the theory, it will be proper to give a sketch, though a slight one, of the principal discoveries connected with the subject. The earliest experiments which could have served as a basis for the atomic theory are those of Wenzel, a German chemist, who published, in 1777, a work On the Affinities of Bodies; the experiments detailed in it, though neglected at the time, are now acknowledged to possess a very considerable degree of accuracy. The author showed that when any two neutral salts dissolved in equal parts of water, the rays which transmitted the light through each salt, and each of its compounds were exactly neutral. ‘The very attempt,’ remarks Dr. Thomson, ‘to analyze the salts was an acknowledgment that bodies united with each other in definite proportions, in number as well as in their powers, and that in this line of research, so long followed out, would have ultimately led to the doctrine of atoms.’ (History of Chemistry, vol. ii. p. 278.)

With reference to this subject, it is observed by Sir H. Davy, that there may be found in the works of Dr. Bryan Huggins and Mr. W. Huggins, and of Professor Ritter, hints or conclusions bearing directly on this doctrine. Dr. Bryan Huggins, in his Experiments and Observations relating to Acetic Acid, fixable Air, dense inflammable Air, &c. &c., published in 1787, united with each other in limited proportions only; and this depended upon the combination of their particles or atoms, with the matter of fire which surrounds them as an atmosphere, and makes them repulsive of each other; and he distinguishes between simple elastic fluids, as composed of particles of the same kind, and compound elastic fluids, as consisting of two or more particles combined, in which he calls molecules, definite in quantity themselves, and surrounded by other proportions of heat. Dr. Bryan Huggins’s notions have, I believe, been, by the writers on the atomic theory; Mr. William Higgins’s claims have, on the contrary, often been brought forward. Yet, when it is recollected that this gentleman was a pupil and a friend of his, he will hardly be considered as one of those who, called the Comparative View, was published some years after the treaties I have just quoted, and that his notions are almost identical (with the addition of this circumstance, that he mentions certain elastic fluids, such as the compounds of azote, consisting of one, two, three, four, and five proportion of oxygen to one of carbon), it is difficult not to allow the merits of prior conception, as well as of very ingenious illustration, to the older writer. (Discourses before the Royal Society, 1804.)

In justice, however, to Mr. Higgins, it must be admitted that his views were much more extended than those of Dr. Higgins; for it appears that he entertained precisely the same notion of the composition and atomic constitution of bodies as that which is called the New Theory, and it is of that which he says, in his Comparative View of the Phlogistic and Antiphlogistic Theories, published in 1790, p. 37, he says, ‘As two cubic inches of light inflammable air require but one of dephlogisticated air to conserve them, we must suppose that they are composed of the same atom of fire; and that the difference of their specific gravity depends chiefly on the size of their ultimate particles; or we must suppose that the ultimate particles of light inflammable air require two or three, or more, of dephlogisticated air to sustain them. If this latter were the case, we might produce water in an intermediate state, as well as the vitriolic or the nitrous acid, which appears to be impossible; for in whatever proportion we mix our airs, or under whatsoever circumstances we combine them, the result is invariably the same. The mixture may be observed with respect to the decomposition of water. Hence we may justly conclude, that water is composed of molecules formed by the union of a simple particle of dephlogisticated air, or of oxygen, with a particle of cold, dry, and rarefied air, and that they are incapable of uniting to a third particle of either of their constituent principles.

It is a remarkable circumstance, that although Mr. Higgins’s view of the atomic constitution of the five compound elements of the earth, as the earth is commonly admitted, he does not state their composition; and his idea of the comparative atomic constitution of sulphur and sulphuric acid is decidedly erroneous. Indeed, as remarked by Sir H. Davy in the discourse above quoted, ‘neither of the parties attempted to express the quantities in which bodies combine by numbers.

In 1792, Richter, a Prussian chemist, published a work called Elements of Stoichiometry; or the Mathematics of Chemical Composition. He was almost in the same way as Wenzel had previously done, but extended it very considerably; he endeavored to determine the capacity of saturation of each acid and base, and to indicate by numbers the weights which mutually saturate each other. He published a table of these, but though the attempt was new and exceedingly ingenious, the results were far from accurate.

The discoveries of Proust, a French chemist who was professor of chemistry at Madrid, are well worth considering, for it is that which is even now generally admitted, that metals unite only with definite proportions of oxygen, and that the same law existed with sulphur and the metals, and that these might be expressed more accurately by numbers, a view which was followed out by Berthollet, but their accuracy is now generally admitted.

In the year 1803, Mr. (now Dr.) Dalton, of Manchester, communicated to the Literary and Philosophical Society of Manchester an essay containing an outline of his speculations on the subject of the composition of bodies (Manchester Memoirs, second series, vol. i. p. 286). The following year he explained his notions on the subject to Dr. Thomson, and in 1808 he published the first volume of his Elements of Chemical Philosophy, in which he gave an outline of his idea of the constitution of matter, and this without any acquaintance with what had been previously done on the subject by Higgins.

Dr. Dalton was unquestionably the first who laid down clearly and numerically, the doctrine of multiples, and endeavored to express by simple numbers the weights of bodies believed to be elementary. He announced it as a general rule, that when only one combination of a body can be obtained, it must be a binary one, unless some cause appear to the contrary. Consistently with this law, and correctly at the time it was written, Dr. Dalton regarded water as a binary compound of hydrogen and oxygen, and the relative weights since corrected are as 18 to 8. As water consists of an atom of hydrogen and an atom of oxygen, either of these elements may be selected as unity, and, in fact, as we shall hereafter notice, both have been occasionally employed as such. Dalton fixed on hydrogen, because it is, that which unites with others in the smallest proportion; thus,
them, we have water composed of one of hydrogen by weight, or one atom, and eight of oxygen by weight, or one atom, and in all cases an atom of hydrogen being represented by 1, an atom of oxygen will be represented by 8; and these being the atomic weight of the elements, that of the compound will be obtained by adding them together, thus:

Hydrogen 1 atom = 1
Oxygen 1 atom = 8
Water 1 atom = 9

The weight, then, of a compound atom is obtained by adding together the atomic weights of its constituents. Although many elementary bodies unite with hydrogen, there are some which do not combine with hydrogen or with oxygen, and therefore, the hydrogen standard or unit fails on this account, we may refer to the atom of oxygen, and determine what weight in question, such as in 16, is formed of only one compound to be formed, unites with eight parts by weight, or one atom of oxygen. Now cadmium is a metal of this description; it forms no compound with hydrogen, and only one with oxygen, and as eight parts of this element unite with fifty-six of the metal, to form the only known oxide of it, we say that the atomic weight of cadmium is fifty-six, and that the oxide is composed of

Oxygen . . . 1 atom = 8
Cadmium . . . 1 atom = 56

Oxide of cadmium 1 atom = 64

It is, however, possible, though by no means probable, that such an oxide may be formed, for the oxide in question may be composed of either of two or more atoms of oxygen united with one atom of the metal, or the contrary, instead of what is presumed to be; but the error may be detected by examining the proportion in which the metal unites with other elements, whose atomic weights are already determined. The atomic weights of sulphur, chlorine, and selenium, are respectively 16, 36, and 40; now if, in a series of combinations with these substances, the compound containing the largest proportion of metal were constituted of

Sulphur 16 Chlorine 36 Selenium 40
Metal 56 Metal 56 Metal 56

we should then conclude, as these agree with the composition of the oxide, as above given, that 56 is the atomic weight of the metal. But if it were found that the compounds in question containing the largest proportion of metal were constituted of

Sulphur 16 Chlorine 36 Selenium 40
Metal 112 Metal 112 Metal 112

we should conclude that the atomic weight of the metal was 112, and consequently that the oxide formed of 8 oxygen and 56 metal was a peroxide, or composed of 2 atoms of oxygen combined with 1 atom of metal.

If, on the other hand, it appeared that the compound containing the largest proportion of metal consisted of

Sulphur 16 Chlorine 36 Selenium 40
Metal 23 Metal 23 Metal 23

we must then consider the oxide composed of 8 oxygen and 56 metal as a suboxide, constituted of 1 atom of oxygen = 8 + 2 atoms of metal = 56.

This method of proceeding is according to the rule thus laid down by Dr. Dalton, 'It is necessary not only to consider the combinations of A with B, but also those of A with C D E, &c., as well as those of B with C D, &c., before we can have good reason to be satisfied with our determination as to the weights which enter into the various compounds.' (New System of Chemical Philosophy, vol. ii. p. 300.)

In fact, the protioxide of a metal, i.e. 1 atom oxygen + 1 atom metal, may possess such properties as to prevent its composition from being determined accurately ascertained; and it is likewise possible that no protioxide may exist.

We have alluded to the circumstance, that various compounds of the same two elements may exist, and supposing any metal, say copper or silver, combined with the same proportions of oxygen, various questions may arise as to the constitution of the resulting oxides: as, whether that which contains least oxygen is a protioxide or protioxide; or whether that which contains most is a protioxide or a perioxide. These are points which can be determined only by experiment.

For example, with respect to oxygen and copper, that oxide which contains least oxygen consists of 8 oxygen + 64 metal; that which contains most, of 16 oxygen + 64 metal: now, in this case, we consider that which contains least oxygen as composed of 1 atom of each of its elements, and that which contains most, as formed of 3 atoms of oxygen + 1 atom of copper—thus:

Oxygen 1 atom = 8 Oxygen 2 atoms = 16
Copper 1 atom = 64 Copper 1 atom = 64

Protioxide of cop. 1 atom = 75 Perioxide of cop. 1 atom = 80

This rule of assuming that oxide to be a protioxide which contains least oxygen will be generally found correct, except perhaps when most improbable, and in this instance, by the corresponding constitution of the two chlorides and two sulphate, we find the oxides of silver, however, form an exception, though a very rare one, to this rule; there are two oxides of this metal composing the composition of

Oxygen 8 and Oxygen 8
Silver 165 Silver 110

If it were to be assumed in this case, that 165 is the atomic weight of silver, because it is the largest proportion which combines with 8, or 1 atom of oxygen, the assumption would be erroneous, for this reason: no corresponding chloride, sulphuret, &c., and it would be unlike other protioxides, in forming no compound with any acid. But all these properties belong to the oxide of silver composed of 8 oxygen and 110 silver; in this case the oxide contains metal and oxygen, which is composed of 3 atoms of oxygen + 18 + 3 atoms of silver 320. In fact, however, the rule may be relied upon, that the metallic oxide which contains least oxygen is the Protioxide, and that weight of metal which combines with 8 by weight of oxygen, denotes the weight of its atom, and their united weight that of the oxide.

It will be observed, with respect to the compounds of oxygen and copper, that the second portion of that element unites with the same quantity of metal, is double the first. Now upon this fact are founded one of the most important and beautiful peculiarities of Dr. Dalton's theory, sometimes described as the doctrine of multiples. In the case just alluded to, the second portion of copper is precisely double the first; but there are some cases in which the greater proportions are not multiples of the less, by any entire number: for example, there are two well-known oxides of iron consisting of

Oxygen 8 Oxygen 12
Iron 28 Iron 28

The first of these is the protioxide, and the second the perioxide; but it will be observed, the second portion of oxygen is only one-half greater than the first, instead of double, as happens with respect to copper. In fact, the additional quantity is equal to only half an atom of oxygen; and the method of dividing and multiplying is overcome by multiplying both the oxygen and iron by 2, in which case we shall have 12 × 2 = 24, or 3 atoms of oxygen, combined with 28 × 2 = 56, 2 atoms of iron, and these proportions are perfectly correct with the theory.

Other cases of apparent anomaly occur: thus there are three oxides of lead, viz:

Oxygen 8 Oxygen 10.86, &c. Oxygen 16
Lead 112 Lead 29.4 Lead 28
The first and last of these oxides are composed exactly as the oxides of copper are, the second portion of oxygen being double that of the first; but the red oxide of lead is composed of an atom of metal and such a quantity of oxygen as is equal to one atom and a third. If, then, both the oxygen and metal be multiplied by 3, we shall have a compound of 4 atoms of oxygen and 3 atoms of lead, or 24 + 315 = 339, and it is seen if these 344 parts of red lead be treated with much dilute nitric acid, they are separated into 8 atoms of protioxide = 224, which are dissolved, and 1 atom of perioxide = 119, which remains unacted upon in the state of the powder. This case, then, of apparent anomaly is explained by showing that the red oxide of lead is equivalent to, or perhaps composed of, the other two oxides, and is resolvable into them.

The oxides of manganese offer a still more remarkable case of apparent irregularity of combination, and of the disposition of metallic oxides themselves to combine in definite proportions. There are five oxides of this metal, all of
which are reducible into the protoxide and peroxyde by the action of dilute sulphuric acid.

While on the subject of multiples, it will be proper to adduce one of the most remarkable and regular series of them presented to us. There are five compounds of oxygen and azote, viz.

Oxygen.  
Nitric oxide, composed of \( 8 = 1 \text{ atom} + 14 = 1 \text{ atom} \).  
Nitric oxide 16 = 3 atoms + 14 do.  
Nitrous acid 24 = 2 + 14 do.  
Nitrous acid 32 = 4 + 14 do.  
Nitric acid 40 = 5 + 14 do.

In these compounds, it will be observed, to form a new compound, 1 atom of oxygen in every case added to the preceding quantity, and the atoms of oxygen combined with

While in some cases the hydrogen and in others the oxygen standard is assumed, there are others in which they may be employed indiscriminately; thus, of carbon 6 parts by weight is the large quantity which combines either with 1 part by weight of hydrogen, or 1 atom, or with 8 parts by weight of oxygen, or 1 atom; 6 is therefore the atomic weight of carbon. But with sulphur the case is different; 32 is the largest portion that combines with 1 of hydrogen, but 16 is the greatest quantity that may be mixed, as it now is, with 8 of oxygen; now the latter, or 16, is assumed as its atomic weight, for 22 taken, as indicated by the hydrogen unit, we should have no compound of 1 atom oxygen + 1 atom sulphur, which would occasion more inconvenience than results from the interposition of a subhydrous or of a sulphuret of hydrogen, or, which is the same, a bismuthuret of hydrogen.

With respect to azote also, the atomic weight is fixed at 14, that being the largest quantity which combines with 8 of hydrogen. Two compounds of hydrogen and azote, viz. ammonia; this consists of 3 parts by weight of hydrogen and 14 by weight of azote; consequently, if we had taken the hydrogen standard, the atomic weight of azote would have been \( \frac{14}{3} = 4 \frac{2}{3} \), which would have greatly complicated the constitution of the compounds of oxygen and azote; but the alternative of supposing ammonia to contain 3 of hydrogen instead of 1 of oxygen is of secondary importance, though it must be admitted that it contravenes the rule laid down by Dalton, that when only one combination of two bodies can be obtained, it must be presumed to be a binary one.

The case in which the second portion of oxygen in an azide, instead of being equal to the first, is only one-half greater has been pointed out in the instance of the oxygen of iron, and the means by which the absurdity of supposing the existence of half an atom is obviated has been mentioned. There are, however, some cases in which it is convenient to consider such an azide as containing an atom and a half of oxygen, and it is then termed a sesquiazide; there are also several instances in which salts are commonly considered as containing a quantity of acid equal to an atom and half, and these are termed sesquiacids.

The alkaline ammonium, phathal, and soda, and some other bases, form three compounds with the same acid; for example, we have

Carbontate of potash, composed of 1 of sodium + 1 atom base.
Bicarbontate of potash, 2 atoms sodium + 1 atom do.
Potash, 3 atoms sodium + 2 atoms do.

It is very evident that the last salt is equivalent to a compound of 1 of sodium + 1 atom base. Now if an atom of the base, instead of entering the combination directly, be decomposed, by the action of nitrate of lime, double decomposition ensues, 1 atom of neutral nitrate of potash remains in solution, 1 atom of neutral carbonate of lime is precipitated, and carbonic acid escapes, and if the quantity of lime be in excess, 1 atom of neutral carbonate of lime is precipitated, and carbonic acid escapes; for if lime-water be added to an atom of a sesquiacid, carbonate of lime is precipitated equivalent in quantity to 1 atom of the base.

These facts are sufficient to show that combining and atomic weights are not convertible terms, though they have been so employed. Thus the atomic weight of an alkaline compound of 3 atoms carbonic acid and 2 atoms potash is 162; considered as a sesquiacid, its atomic weight is 81; and its combining weight is the same with respect to an atom of nitric acid; but it is one-half greater as regards an atom of lime. The same remark will apply to bisalts; they must also be considered as having one combining weight for their acids and another for their bases.

It may now be easily made to appear how it happens that when two neutral salts decompose each other, the new salts obtained by the operation are neutral; an atom of nitric acid weighs 64, and one of barytes 76, forming when mixed an atom of neutral nitrate of barytes; 88 = atom of neutral sulphate of potash is composed of an atom of sulphuric acid = 40, and an atom of potash = 48. Now when 130, or an atom of nitrate of potash, is mixed with a solution of 88, or an atom, of sulphate of potash, double decomposition ensues, and two new and entirely perfect salts are formed, viz., 1 atom of nitrate of potash = 102, consisting of an atom of nitric acid = 44, and an atom of potash = 48; this remains in solution; and there is precipitated an atom of neutral sulphate of barytes = 116, composed of 1 atom of sulphuric acid = 40, and 1 atom of barytes = 76. The annexed diagram will show the constitution of the salts employed, and those formed by them. From this explanation; and it will be seen also that the weight of the new compounds is precisely equal to those of the original salts.

![Diagram](image)

Although the atomic theory, thus developed by Dr. Dalton in 1806, contained truths of the highest importance, quite independent of the hypothesis by which they were illustrated, it was not until after the appearance of Dr. Wollaston's Memoirs, On Super-acid and Sub-acid Salts, and On a Synoptic Scale of Chemical Constitution, that chemists were fully impressed with the practical applications of which the theory was susceptible. In the first memoir (Phil. Trans. 1806), a memoir equally remarkable for its conciseness and clearness, Dr. Wollaston shows, that Dr. Dalton's theory, first applied to determining the constitution of gaseous bodies, is applicable to that of super-acid and sub-acid salts; and he proves that super-carbonate of potash contains exactly half the quantity of carbonic acid existing in the super-carbonate, by showing that if the latter be heated it loses half its acid, and is reduced to the state of sub-carbonate by the loss; the same rule was found to exist with the sub-carbonate and super-carbonate of soda, the sulphate and super-sulphate of potash, and with three oxalates of potash.

The paper on the 'Synoptic Scale' appeared in the Phil. Trans. for 1814. By this instrument the practical utility of the doctrine of definite proportions was most satisfactorily pointed out.

This instrument consists of a moveable scale of numbers on the principle of Gunter's scale, so that any number can be placed opposite the names of a series of substances in adjoining columns, arranged in the order of their combining weights. To each name is attached the combining weight of a body being placed opposite to its name—that, for example, opposite to oxygen—the numbers expressing the combining quantities of others will appear opposite to their names; thus copper will be found opposite to 40, showing that this quantity it combines with 19 of oxygen, and opposite to 50 will be found oxide of copper. By mere inspection, a great number of important results are obtained. If the composition of a substance with regard to the proportion of its elements is to be determined, the slider is to be so placed that the number 100, or any required number, is opposite to its name, and the respective quantities of the ingredients will be found opposite to their names; and the quantities of the ingredients required to decompose them: for example, when 86 is placed opposite to sub-carbonate of potash, 27:5 will be opposite to carbonic acid, 59:1 to potash, 61:3 to oil of vitriol, 50 to dry sulphuric acid, and 11:3 to water.
Now it is well known that sub-carbonates of potash is de-
composed by sulphuric acid; and on further inspecting the
scale, it will be observed that sulphate of potash, the newly-
formed salt, is opposite to 1091, showing the quantity formed
by the union of 50 of dry sulphuric acid and 591 of potash,
while 272 of carbonic acid are expelled, and 113 of water
are set free. This simple example is sufficient to show the
very extensive use which, by mere inspection, may be made
of this instrument in exhibiting the constitution of various
oxides, acids, and salts, and of the quantities of substances
required to form or decompose compound bodies.

As the results of these labours, he laid down certain laws
relative to chemical combinations, which, however, are in
general, and when correct, only to be considered as corol-
aries from those determined by Dalton. Within a few
years, a curious discovery has been made with respect
to the atomic constitution of some substances, viz., such
as are composed of precisely the same elements and in
the same proportion, but which possess very different pro-
perties; they are termed isomorphous bodies: the two
compounds of hydrogen and phosphorus; oil of wine and
light liquid hydro-carbon; tartaric and paratauric acids, are
among the more remarkable instances of this similarity of
composition and very different similarity of properties. It is,
however, extremely probable that more of such classes of
bodies exist, though they contain the same relative number,
so that the extent of similar number of atoms of the same
elements; on this hypothesis the atomic weights will differ, though they have
been estimated to be similar, and the different arrangement
of similar atoms in consequence of their increased number,
may be such as to occasion the difference of properties
observed.

In 1814 it was considered that part of the subject which
relates to the laws by which solid bodies enter into atomic
combination, it will be necessary to notice the very
important laws which M. Gay-Lussac discovered with respect
to the combination of gaseous bodies. The memoir con-
taining these laws is termed the Theory of Volumes in
vol. ii. p. 207 of the Mémoires de l'Académie, 1814, and is
titled Sur la Combinaison des Substances Gazeuses, &c.
The author, suspecting, from the previously-ascertained fact that
100 volumes of oxygen gas combine with 200 volumes of hydrogen
gas to form water, that other gaseous bodies would
be found to unite in simple proportions of nitric or
nitrous acid, and fluoric acid gasses, and combined them with
ammoniacal gas, and be found that they united in the follow-
ing proportions:

100 volumes of nitric acid gas with 100 of ammoniacal gas.
100 volumes of nitrous acid with 100 of ammoniacal gas.
100 volumes of hydrogen with 200 volumes of ammoniacal gas.
100 volumes of fluoric acid gas with 200 volumes of
ammoniacal gas.

The series of compounds, however, which must remarkably
illustrate the fact that gaseous substances unite in the simple
ratio of 1 to 1, 1 to 2, 1 to 3, &c., are those of oxygen and
nitrous acid, already mentioned with other views, are:

The same results has found also to apply to the combination
of gaseous with auras, thus:

100 volumes of hydrogen gas with 100 volumes of oxygen gas.
100 volumes of oxygen gas with 100 volumes of hydrogen gas.
100 volumes of oxygen gas with 100 volumes of carbon dioxide.
100 volumes of hydrogen gas with 100 volumes of carbon dioxide.

Indeed, chemists have ventured, on the strength of the last
mentioned facts, to estimate the weight of the vapour of
bodies which have been condensed from sulphur and salol, being
separately vaporized; that light carbonated hydrogen gas, it
is presumed to be composed of two volumes of hydrogen gas,
and one volume of the vapour of carbon; and so with all
other gaseous compounds of carbon.

Dr. Turner (Elements of Chemistry, p. 204) has well ob-
erved, that the simple ratios in which volumes combine
is peculiarly interesting, because it appears to indicate a
close correspondence in the size of the atoms of gaseous
bodies.

The same numbers which indicate the specific gravity of
elementary principles in the gaseous state would then express
the relative weights of the atoms, and the specific gravity
be ascertained by means of the former, or the atomic weight
of a solid or liquid represent the specific gravity of its
vapour. The proportional numbers adopted by Sir H. Davy
in his Elements of Chemical Philosophy, and the atomic
weights employed by Berzelius in his System of Chemical
Principles were selected in accordance with this view.

Thus, water, being formed of two measures of hydrogen and one measure of
oxygen, is believed by Berzelius to consist of two atoms of
the former, and one atom of the latter; and, for a similar
reason, benzoyl is composed of 21 atoms of hydrogen gas,
and two atoms of nitrogen and one atom of oxygen.

The atoms and volumes of the four elementary gases—oxygen, chlorine,
hydrogen, and nitrogen—are thus made to coincide with the
atomic weights of their various chemical bases, though perhaps preferable in one
other, has not hitherto been possible. It is interesting to
observe, that the chemists consider water, protoxide of chlorine, and protoxide of
nitrogen, as containing each one atom of their elements;
and, consequently, that as the compounds consist of one
measure of oxygen gas united with two measures of the other
constituent, the atom of hydrogen, chlorine, and nitrogen
are supposed to occupy twice as much space as an atom of
oxygen. An atom of oxygen is therefore represented by
half a volume, and an atom of the other three gases by a
whole volume.

Dr. Thomson, in the sixth volume of the
Annals of Philosophy, a paper 'On the Relation between
the Specific Gravities of Bodies in their Gaseous States, and
the Weights of their Atoms,' the observations offered in
this memoir are not precisely in accordance with the
conclusions of volumes just described. The author shows, that if
atmospheric air be a compound of 20 volumes of oxygen and 80
volumes of nitrous gas, and its equivalents 8 and 14, then the spec-
ic gravity of these gases are—oxygen, 1/1111; nitrous
1/9722. He also shows, that the specific gravity of
hydrogen gas is 1/694; that if we reckon the atomic weight of
hydrogen 1/125, that of oxygen is unity. He also ob-
serves, that the atomic weights of bodies appear to be mul-
tiples of the atomic weight of hydrogen by a whole number.

It was remarked by him, that in the general the specific
gravity of the body in a gaseous state may be obtained by
multiplying its atomic weight by 1/6958, or half the specific
gravity of oxygen gas, because the atom of oxygen is repre-
sented by half a volume, but that of most other substances
by a whole volume.

Dr. Thom. (Attempt to establish the First Principles of
Chemistry by Experiment, vol. i., p. 96), fully adopting
Dr. Prout's views on this subject, says—Every substance,
of which I could procure—a sufficient quantity to enable me
to examine it fully, has been not only a multiple of the
atomic weight of hydrogen; but, if we except a few com-
pounds into which a single or odd atom of hydrogen enters.

They are all multiples of 2/3, or of two atoms of hydrogen.

This count and examination of the tables of the atomic weights, and
the last paper now before us, will be evident that such a law
would afford great facilities, as all fractional numbers would be
avoided, hydrogen being reckoned unity. In this

The late experiments of Muhler, and that of the
density of gases to their atomic weights, tend also
to prove that the doctrine of Prout cannot be safely
submitted.

(An. de Ch. et de Ph. l.v.).
Before giving a table of the atomic weights of elementary bodies, it would be proper to state the nature and weight of the standard from which they are reckoned, and the different terms employed to designate what—adopting the language of Dr. Dalton—we have described as an atom.

**STANDARD.**

Dr. Dalton, atom, hydrogen 1 oxygen 7
Dr. Faraday, equivalent, hydrogen 10 oxygen 1:13
Sir H. Davy, proportion, hydrogen 2 oxygen 15
Dr. Thomson, atom, oxygen 1 hydrogen 1:25
Berzelius, atom, oxygen 100 hydrogen 12.4793
Dr. Henry, atom, hydrogen 1 oxygen 8
Dr. Turner, equivalent, hydrogen 1 oxygen 16
Mr. Faraday, proportion, hydrogen 1 oxygen 8
Mr. Brande, proportion, hydrogen 1 oxygen 8

The method of mutually converting the numbers of each standard into those of the other is too obvious to require explanation.

The use of the term atom has been objected to as hypothetical, because it is said that we have no means of ascertaining or judging of the weight or magnitude of an atom of any element, and that any supposed relative weight of these atoms must therefore be a mere hypothetical assumption, which no satisfactory conclusion can be drawn from, and by those who appear to entertain this opinion, other terms, as above quoted, are substituted for the word atom, which is, however, intended to express merely the smallest division which is found of any element without decomposition.

The following remarks by Dr. Wollaston, in his memoir on the finite extent of the atmosphere (Phil. Trans. 1829), are strongly in favour of the atomic constitution of matter.

Now, though we have not the means of ascertaining the extent of our own atmosphere, those of other planetary bodies are nevertheless objects for astronomical investigation; and it may be deserving of consideration, whether, in any instance, a deficiency of such matter can be proved, and whether, from this source, any conclusive argument can be drawn in favour of ultimate atoms of matter in general. For, since the law of definite proportions discovered by chemists is the same for all kinds of matter, whether solid, or fluid, or elastic, if it can be ascertained that any one body consists of particles no longer divisible, it can then scarcely doubt that all other bodies are similarly constituted; and we may without hesitation conclude, that those equivalent quantities, which we have learned to appreciate by proportionate numbers, do really express the relative weights of elementary atoms, the ultimate objects of chemical research.

It is to be observed, that it is not ponderable matter only which appears by the law of definite proportions. Duhring and Petit have inferred from their experiments (Ann. de Ch. et de Ph., vol. x.) that the atoms of simple substances have the same capacity for heat. Dr. Dalton has, however, objected to this opinion, that the product of the weight of an atom by the constant of the heat is not a constant quantity; because the capacity of the same substance varies with change of form, or with variation of temperature without change of form. Added to which the weights of the atoms, as indicated by the specific heat, would be very materially different from those now adopted in many cases.

The late beautiful experiments of Mr. Faraday on the absolute quantity of electricity associated with the particles or atoms of matter, prove that, for a given definite quantity of electricity passed, an equally definite and constant quantity of water or other matter is decomposed; and he concludes also, that the electricity which decomposes, and that which is evolved by the decomposition of a certain quantity of matter, are alike. "The harmony," observes he, that the theory of the definite evolution of electricity and the equivalent definite action of electricity introduces into the associated theories of definite proportions and electro-chemical affinity, is very great. According to this, the equivalent weights of bodies are simple ratios of those quantities of heat which contain equal quantities of electricity, or have naturally equal electric powers; it being the electricity which determines the equivalent number, because it determines the combining force. Or, if we adopt the atomic theory or pharsology, then the atoms of bodies which are equivalents to each other in their ordinary chemical action have equal quantities of electricity naturally associated with them. (Phil. Trans. 1824.)

With respect to the utility of the atomic theory, we cannot do better, in concluding this account of it, than to state, in the words of Dr. Daubeney (Introduction to the Atomic Theory, p. 87), that "it would be superfluous to enlarge upon the proofs already afforded, with respect to the greater precision it has introduced into the sciences, and the wonderful saving of time and labour which is derived from it, not only by the philosopher in his more speculative inquiries, but even by the manufacturing chemist, in the every-day operations of his trade."

It is evident that, in the present state of our knowledge, no sooner have we ascertained the exact proportion in which a new substance unites with any one of those bodies whose atomic weight is already determined, than we are enabled to calculate in what quantities it must combine with all the remainder, so that, instead of being perplexed, we would have appeared necessary, to analyze every existing combination, in order to determine the proportion of its ingredients; which phenomenon, were it not for the sake of obviating the chances of error in any single experiment, with ascertaining the composition of that out of
air, more or less, revolving with the earth up to so great a height. Forty or fifty miles is supposed to be the limit which it reaches; but, however, to entering upon this question, it is material to know whether we are to consider air as infinitely divisible or not. By which we mean, is it possible for air to be rarefied to any extent whatever, and still preserve its greatest density, or, its greatest virulence? and if so, in what parts? We might mention various arguments drawn from the atomic theory, but Dr. Wallaston (Phil. Trans. 1812) has discussed this subject in a form which, while it adds some force to the atomic theory, at any rate, it does not seem connected with our subject; it furnishes a very strong presumption for the finite extent of the atmosphere. The following is a synopsis of his argument.

If there be air throughout the universe, we are obliged to suppose that every planet would collect an atmosphere around itself, proportionate to its attracting power. In this case, we know that Jupiter, at whose surface the force of gravity must be much greater than at that of our earth, would collect a powerful atmosphere around it. The effect of the refraction of light through this atmosphere would become visible in the approach of the satellites to the planet, when they disappear behind his disc, and would cause a sensible retardation in their rate of approach. No such effect could otherwise be observed; and, consequently, Jupiter has no such atmosphere, nor the means of collecting it: consequently, air, as we have at the earth, is not diffused in any degree of rarefaction through the whole solar system. Dr. Wallaston gives the following character of the air. The atmosphere is more conformable to the atomic theory than to that of the infinite divisibility of matter, since, in the first case, a boundary is possible, and will exist at the point where the weight of a single atom is as great as the repulsive forces of the medium; while in the latter case it is difficult to see the possibility of any boundary.

It has lately been observed, that Sekcke's comet appears, in successive revolutions, to show a slight degree the effect of refraction, its appearance being that of a small, redish object; which same thing has very lately been said of that of Biela. It might therefore appear that the preceding argument is weakened in force by this circumstance, or, nice versa, since the large planets might collect sensible atmospheres of the resisting fluid, whatever it be. But on this we must observe, that supposing the fact of the resisting medium to be established (and several astronomers are of that opinion), it by no means follows that it is common air, or any thing approaching a fluid in cession of its density.

On the contrary, the facts observed with regard to the motion of the planets (which show no signs whatever of a resisting medium), and the extreme tenacity of the comets themselves (through which so faint stars may be seen), justifies the supposition that there exists in the atmosphere of a very high degree of elasticity as compared with air; and it is by no means improbable that the planets actually may have atmospheres of this same medium, not sensible to our instruments, on account of the very small increase of density which is sufficient to counterbalance the action of a planet. To elucidate this subject, see Elasticity, Fluid, (Elasatic).

The preceding arguments go to show, that even supposing the temperature of the atmosphere to be uniform throughout, there is no inconsistency in the supposition of a finite atmosphere. But a very strong presumption in favour of such an hypothesis is derived from the rapid decrease of the barometer and other gases at the base of the air, and the sinkage of the surface of the earth. The law of this decrease is unknown to us; at least we cannot even guess at the form it assumes in the higher regions of the mass of air. To this circumstance it is owing that all we can say upon those subjects must be little more than speculation. Near the earth, even at great elevations above the level of the sea, we cannot say that observed temperatures correctly represent the law of the atmosphere: for example, we cannot say that the average temperature of Quito, which is more than 9000 feet in elevation, is the temperature of the air 9000 feet above, and over, the sea. The only observation worthy of any confidence is that of Gay-Lussac, taken during his celebrated ascent, at a height of 6900 meters above the sea, which is the average temperature between air at the surface and at the height just mentioned was 40°F of the centigrade thermometer, or nearly 73°F of Fahrenheit. This, if the decrease of temperature be uniform, gives a diminution of 1°F of Fahrenheit for every 189 yards, or of 1 centigrade for every 173 degrees of elevation.

The following table was deduced by Humboldt from various observations. It will serve to show how far the temperatures of elevated regions in the earth agrees with those of the same height in the atmosphere, as deduced from the preceding. The first column is the height of the land above the level of the sea (in meters); the second, the mean temperature of the centrifuge at any given height; the third, the same in about 45° of latitude. The thermometer used is the centigrade; (+) above, and (−) below, the freezing point.

</table>

From the preceding table, it appears that at the equator, on the average of 4872 meters, a rise of 187 meters gives a rise of 1° of Fahrenheit; while at the same height in higher regions than in the lower. From 0 to 1949 meters of elevation, an elevation of 214° produces a fall of 1°; but from 2932° to 4872°, an elevation of 152° does the same.

The argument in favour of the finite extent of the atmosphere, derived from the preceding observations, is as follows. Suppose an elevation of 200 yards to produce a fall of 1° of Fahrenheit's thermometer (which, as we have seen, is likely to fall short of the truth), that is, to give the higher regions of the atmosphere a higher temperature than that at the same height in the bether. It follows, that at a height of forty miles above the level of the sea, the temperature of the air must be 350° of Fahrenheit below that of the sea, or certainly more than 300° below the freezing point. There is the strongest reason to suppose that the atmosphere will be a gaseous state at this low temperature, but would become liquid: and though no gas has yet been rendered liquid by reduction of temperature, yet several have been reduced to that state by cold and pressure respectively.

If, then, we suppose the atmosphere of finite extent, its form must be nearly that of an oblate spheroid, the lesser axis passing through the poles of the earth; at the same time the action of the sun and moon must produce certain diurnal oscillations; and hence the temperature of the atmosphere must be constantly disturbing the base on which the atmosphere rests, must produce periodical alterations of form in the latter also. If any such exist, sensible, they may be detected by the barometer; for, certes variabilis, any increase in the height of the barometer will be accompanied by a small increase in the height of the counterbalancing column of mercury. Laplace was the first who examined this curious branch of the subject. He showed by analysis that the attraction of the sun and moon could produce no permanent effect upon the currents of the atmosphere; for instance, such as the trade-winds. He also showed that the diurnal oscillations caused by the above-mentioned attractions would only produce a very slight effect upon the atmosphere; in fact, less than one millimetre, or 1/25th of an inch. The reduction of a large number of observations gave, at first, 0.05 of a millimetre for the quantity in question; those of another set gave 0.18; from which Laplace concluded, taking into account the smallness of the oscillations previously mentioned and the degree of probability which could be a posteriori calculated so different, that the sensible existence of the atmospheric tide was doubtful. In the meantime, however, the diurnal variation of the barometer has been observed in the meridian of Paris, and observations made in several different places. But the law and amount of this oscillation appears to vary so much with latitude, climate, and other circumstances, that no positive conclusion can yet be drawn, either to the exclusion of atmospheric tide, properly so called, or the adoption of any other cause in conjunction with it. Professor Forbes (Report of British Association, p. 230) has discussed all the observations, and has given a formula which represents tolerably well.

The average pressure of the atmosphere is found to be the same, or very nearly so, at any one place from year to year.
height ascended. The method of doing this will be explained in the article *Heights (Measurement of)*; we notice it here in order to mention a circumstance which shows that our knowledge of the general conditions of the atmosphere has not been overstated. In order to construct the formula, it is necessary to know the annual variation of the weight of the air, not only from its rarefaction, but also from its increasing distance from the earth,—the variation of elastic force, as well from rarefaction as from the attraction of the earth for the air above it, and also due to the attraction of the moon, arising from the alteration of temperature,—and to use the formula in different latitudes, the variation of the force of gravity on the earth's surface. In our ignorance of the variation of the temperature, it is usual to allow to the whole column of air at each separate point of observation, the average temperature of its upper and lower extremities. This is the most doubtful part of the process; and as a verification, recourse is had to the comparison of heights measured by the barometer, and also by the processes of trigonometry. It is thus found that a coefficient which, when deduced from theory alone, is 16337.46, appears from a number of heights measured trigonometrically to be 16336, differing from the former only by about its 16,000th part. This shows the effect of temperature to be sufficiently well taken into account, for such heights as we can measure, by the preceding supposition.

In the article *Air* some reasons were shown for supposing that its component parts were not united chemically, but only mixed. This opinion, which is now almost universally adopted, has given rise to questions on the constitution of the atmosphere, differing entirely from those of all chemists down to the present day. A law is found to prevail in the mixture of gases and vapours, as universal as the one described in the article *Air*, relative to the expansion arising from temperature,—namely, that two gases in a state of mixture exercise upon each other no influence one upon another, or communication of temperature, but that each is disposed in exactly the same manner as it would be if the other were not present. Thus it is found, entirely contrary to all previous notions, that no pressure of dry air upon water exerts the least influence in preventing the water from being blown which goes on exactly as if the space above were a vacuum, and continues until further evaporation is stopped by the pressure of the *steam already created*. It is found that no pressure of one gas can confine another in water; thus supposing a bottle partly full of water, the gas confined in the water will escape to the surface and distribute itself in precisely the same way as if the other gas were not present. By this it is not meant that the action commonly called chemical cannot take place, if the pressure is high enough, but that such a pressure would not trouble the air; but only that the permanent settlement of one gas is not affected in any way by the presence of another, so long as no chemical action is excited. From this principle of Mr. Dalton (Phil. Trans. 1802), these results are deduced, the chief of which are the two experiments which exist against the chemical union of the ingredients of the atmosphere, infers that the atmosphere does not consist altogether of the compound called air, but that the *nitrogen atmosphere* is higher than the *oxygen atmosphere*. In fact, if there be no chemical union, the above law of the mixture of gases requires us to allow that each is an atmosphere independent of the other, and that the two are most probably of unequal bents.

From these considerations Mr. Dalton enters, and thinks that the actual pressures exerted by the oxygen and nitrogen are in the proportions of the columns occupied by them (see *Air*), that is as 1 to 4; and concludes that the oxygen atmosphere constitutes 18 miles in height, that of nitrogen to 34 miles, that of carbonic acid to 18 miles, and that of aqueous vapour to 50 miles. It must however be observed, that the state of the carbonic acid of the atmosphere is very variable, that there is not the same quantity by day as by night, in summer as in winter, in dry and in wet; and that the higher strata of the atmosphere contain more of it than the lower, which may arise from rapid absorption by the earth.

Against the hypothesis just described, it might perhaps be observed that the air which Gey-Lamotte brought down from a height of more than four miles was not found to differ from that of the earth's surface in the proportion of its oxygen to its nitrogen, which would have been diminished in density more than in proportion to the diminution of that of the nitrogen, if

We do not know whether the experiments of M. Gay-Lussac were made, or even intended to be made, with that degree of accuracy which would justify its being considered a test of Mr. Dalton's theory; but in any case it is evidence that much work on the subject of gases was being done by chemists and by experimentalists of all sorts, and the progress of the science was being felt everywhere. The total quantity of the atmosphere (if the mean height of the barometer at Paris hold good for all other places) is a little less than the millionth part of the whole mass of the earth, supposing the mean density of the latter to be five and one-fifth times that of water. (Ptolemaeus, Microcosmopolis, 2d. edit. vol. i. p. 610.)

For the colour of the atmosphere, see Bot. For the quantity of moisture contained in it, see Hygrometry.

The atmosphere is the same as the following names: Herce, Cysimius, Galileus, Torricelli, Pascal, Florinco (Academy of), Boyle, Mariotte, Priestley, Scheele, Black, Lavoisier, Cavendish, &c.

The actual composition of the atmosphere, whether composed of molecules exerting a repulsive force upon each other or not, must remain unsettled until some mathematical hypothesis can be found which shall satisfy all observed phenomena. That probabilities are at present all on the side of the molecular or atomic hypothesis, is pretty generally admitted; and the repetition of the several parts of air is a fact of everyday experience. Newton entered upon this question, and showed (Principia, book ii. prop. 23) that if the constitution of the atmosphere be atomic, and if the particles of each atomic constituent shall only touch one another nearest to it, and be either nothing or inconsiderable as to all others, that then the observed proportionality of the elastic force to the density is consistent with no hypothesis except that of a repulsive force inversely proportional to the distance. He does not dwell on this particular point, but contented himself, that is, which becomes double when the distance is halved, and so on. But in the scholium to the same proposition, he takes notice of the imperfection of the hypothesis, and describes his theory as mathematical but hypotheses as philosophical, to consider the subject further. The molecular theory, on the supposition that every particle repels all the rest, or, which is as likely to be the case, has alternate spheres of attraction and repulsion, is in no way the result of the present state of mathematical analysis.

For the state of atmospheric knowledge up to 1868, see Robertson, General View of the Natural History of the Atmosphere, Edinburgh, 1868; from thence to 1872, see Daniel's Meteorological Essays, London, 1872; and for an account of what has been lately done, with further references, see Professor Forbes's Report on Meteorology, in the Reports of the British Association, London, 1873.

Artificial AIR, a distinction which has been preserved after the necessity for such a distinction has passed away. The term is given by the natives of the Maldives to the detached cellular formations of which their Archipelago is composed. They are commonly of a circular form (the reef seldom exceeding a mile in breadth, from fifteen to thirty miles in diameter, and rise perpendicularly from an endless depth of sea). Two openings which occasionally occur in these reefs afford passages for vessels, and safe anchorage is found in many within the coralscreeching wall; the space thus included is often intersected with canals, and is often intersected with canals, and is divided into lagoons, havens, &c. (See Air.)

ATOM, or ATOMS (from the Gr. atomos, indivisible), the ultimate and indivisible particles of matter, from a Greek word, signifying indissoluble. Analagous, the precursor of Bernoulli, who died a pauper, conjectured the number of elements to be near to infinitely infinite, that the greatest atoms composing every substance were of the same kind with that substance. (See Analagous.)

It is a common opinion of philosophers (and a philosopher of Aesopus, who flourished soon after Anaxagoras, and another, Atomus, who wandered in the mountains of what has been called the atomic philosophy, it was adopted by Democritus, in his Cosmogony; and afterwards by Epicurus, to whom its celebrity is chiefly owing. The account of this doctrine is copied from Dr. Good's Book of Nature, and is a clear and accurate sketch of the theory contained in the writings of Epicurus and his followers.

'The atomic philosophy of Epicurus, in its more physical contemplations, allows of nothing but matter and space, and all that we call material things, are not primary existents, but equally existed from all eternity, and from different combinations of which every visible form is created. These elementary principles have no common property with each other; for whatever matters is, that space is the reverse of; and whatever matter is, that space is the reverse of matter; some solidly parts of air, and the parts which are not altogether solid, but an intermixtures of solidity and pores, are space and matter; and this space and matter existed uncombined, or in their pure and elementary state. Space, in its elementary state, is absolute and perfect void; matter, in its elementary state, consists of inconceivably minute seeds or atoms so small, that the corpuscles of vapour, light, and heat are composed of them; and so solid, that they cannot possibly be broken or shattered by any concussion or violence whatever. The express figure of these primary atoms is various: there are round, square, pointed, jagged, as well as many other shapes. These shapes, however, are not diversified to infinity; but the atoms themselves of each existent shape are infinite or innumerable. Every atom is possessed of certain intrinsic powers of motion. Under the old school of Democritus, the unnatural motion or ascending motion, from the natural gravity of the atoms; and a rebounding motion, from collision and mutual clash. Besides these two motions, and to explain certain phenomena to which they did not appear competent, and which could not be accounted for, which is, when a body which has been occasionally possessed of a third, by which, in some very small degree, they descended in an oblique or curvilinear direction, desiring from the common and right line ascending and descending in respect resembling the oscillations of the magnetic needle.

These infinite groups of atoms, flying through all time and space in different directions, and under different laws, have interchangeably tried and exhibited every possible form of mutual encounter; sometimes reflected from each other by concussion, and sometimes adhering to each other from their own jagged or pointed construction, or from the casual interstices which two or more connected atoms must produce, and which may be just adapted to those of other figures, as globular, oval, or square. Hence the origin of compound and visible bodies; hence the origin of large masses of matter; hence, essentially, the origin of the world itself. When these primary atoms are closely compacted, and by the force of mutual attraction, here are clumped and condensed, into kinds of substances which we denominate solids, as stones and metals; when they are loosely and disjuncted, and a large quantity of space or vacuity is interposed, they exhibit bodies in vacuum, gases, heat, light, and air. The world, thus generated, is perpetually renewed by the application of fresh tidles of elementary atoms, flying, with inconvertible rapidity, through all the infinity of space, invisible from their minuteness, and occupying the posts of those times as are perpetually dying out. Yet nothing in eternal or immutable but these elementary seeds or atoms themselves. The compound forms of matter are continually decomposing and dissolving into their original corpuscles; to this there is no exception: minerals, vegetables, and animals, in this respect, are all alike, when they lose their present make, persisting for ever, and new combinations proceeding from the matter into which they dissolve. The world itself is a compound though not an organisable being; sustenance and nourishment is derived from the material pabulum that flows through the body of infinity. The world itself must, therefore, in the same manner perish: it had a beginning, and it will have an end. Its present crisis will be decomposed; it will return to its original, primitive, and tertiary atoms; and new worlds will arise from its destrucion.

'Space is infinite, material atoms are infinite, but the world is not infinite. This, then, is not the only world, nor the original, nor the great or last; it is not more than one of the infinite worlds, which have existed from all eternity; and there are other worlds, and other systems of worlds, existing around us.'

During the most flourishing period of the Greek philo
ATOMIC THEORY, in chemistry, sometimes termed the doctrine of definite proportions. This very important theory, founded on well-ascertained facts, has bestowed on modern chemistry an almost mathematical degree of precision. The hypothetical, which is to be distinguished from the experimental part of the subject, supposes that chemical compounds result from the combination of the ultimate atoms of their constituent parts. It has been determined by Sir Isaac Newton, and subsequent investigators, that a compound body, when pure, always contains the same proportions of its constituents: thus, calcareous spar, and the pure part of marble, chalk, and limestones, consist of carbonate of lime, composed of the same proportions of calcium and oxygen; that the lime contains the same quantity of carbon and oxygen, and that the lime the same proportions of calcium and oxygen. The same law also exists with regard to all similarly constituted oxides, sulphates, and salts, and it is deduced as to all chemical compounds whatever, whether presented to us by nature or formed by art: this is a simple statement of the fundamental facts upon which the superstructure of the atomic theory has been raised.

In order to proceed to detail the minutiae of the theory, it will be proper to give a sketch, though a slight one, of the principal discoveries connected with the subject.

The earliest experiments which could have served as a basis for the atomic theory are those of Wenzel, a German chemist, who published, in 1777, a work On the Affinities of Bodies; the experiments detailed in it, though neglected at the time, are now acknowledged to possess a very considerable degree of accuracy. The author showed that any two substances, when mixed, and the resulting new compounds were finally analysed, were found to contain the same proportions of the ultimate atoms of which they were composed, 'These are the fundamental laws on which the modern atomic theory is based. Dr. R. Thomson, to analyze the salts was an acknowledgment that bodies united with each other in definite proportions; and these definite proportions, had they been preserved, would have been the doctrine of atoms.' (History of Chemistry, vol. ii. p. 278.)

With reference to this subject, it is observed by Sir H. Davy, that 'there may be found in the works of Dr. Bryan Higgins, Mr. William Higgins, and Professor Richter, hints or conclusions bearing directly on this doctrine. Dr. Bryan Higgins, in his Experiments and Observations relating to Acesous Acid, Zuable Air, dense inflammable Air, &c., published in 1786, contends, that elastic fluids unite with each other in the same proportions only; and this depends upon the combination of their particular atoms in the same manner, and by the same law of intermediate states, which surrounds them as an atmosphere, and makes them repulsive of each other; and he distinguishes between simple elastic fluids, as composed of particles of the same kind, and compound elastic fluids, as consisting of two or more particles combined, in what he calls molecules, definite in quantity themselves, and surrounded by definite proportions of heat. Dr. Bryan Higgins's notions are almost identical with the doctrine of the atomists, who maintain that certain elastic fluids, such as the compound of acesous, consisting of one, two, three, four, and five

peptides of oxygen one to one of carbon, is difficult not to allow the merits of prior conception, as well as of very ingenious illustration, to the elder writer.' (Discoveries before the Royal Society, 1858.)

In justice, however, to Mr. Higgins, it must be admitted that this view is distinctly presented in The Antiphlogistic Theories, published in 1790, p. 37, he says, 'As two cubic inches of light inflammable air require but one of dephlogisticated air to condense them, we must suppose that they contain equal number of divisions, and that the difference of specific gravity depends chiefly on the size of their ultimate particles; or we must suppose that the ultimate particles of light inflammable air require two or three, or more, of dephlogisticated air to saturate them. If this latter were the case, we might produce in the intermediate state, as well as the vitriolic or the nitrous acid, which appears to be impossible; for in whatever proportion we mix our airs, or under whatsoever circumstances we combine them, the result is invariably the same. This likewise may be observed with respect to the decomposition of water. Hence we may justly conclude, that water is composed of molecules formed by the union of a single particle of dephlogisticated air to an ultimate particle of light inflammable air, and that these ultimate particles are incapable of uniting to a third particle of either of their constituent principal substances.'

It is a remarkable circumstance, that although Mr. Higgins's view of the atomic constitution of the five compounds of oxygen and azote is that which is now even very generally admitted, he did not state his ideas on this subject, and this idea of the comparative atomic constitution of sulphurous and sulphuric acids is decidedly erroneous. Indeed, as remarked by Sir H. Davy in the discourses above quoted, neither of the Higgenses attempted to express the quantities in which bodies combine.

In 1792, Richter, a Prussian chemist, published a work called Elements of Stochiometrie; or the Mathematics of the Chemical Elements. This author treated the subject in the same way as Wenzel had previously done, but extended it very considerably; he endeavoured to determine the capacity of saturation of each acid and base, and to indicate by numbers the weights which mutually saturate each other. He published a table of these, but though the attempt was new and exceedingly ingenious, the results were far from accurate.

The discoveries of Proust, a French chemist who was professor of chemistry at Madrid, are well worthy of notice, he being the first person who attempted an accurate investigation of the constitution of simple gases, and his work was followed by many others. He first showed that all the metals unite only with definite proportions of oxygen, and that the same law existed with sulphur and the metals, and that these might be stated in numbers. His opinions were strenuously opposed by Berthelot and Berthelot, but their accuracy is now admitted, though not by all. In the year 1808, now Dr. Dalton, of Manchester, communicated to the Literary and Philosophical Society of Manchester an essay containing an outline of his speculations on the subject of the composition of bodies (Manchester Memoirs, second series, vol. i. p. 266). The following year he explained his notions on the subject to Dr. Thomson, and in 1808 he published the first volume of his New System of Chemical Philosophy, in which he gave an outline of his views on the constitution of matter, which had been previously done on the subject by Higgins.

Dr. Dalton was unquestionably the first who laid down clearly and numerically, the doctrine of multiples, and endeavoured to express by simple numbers the weights of the bodies believed to be elementary. He announced it as a general rule, that 'when only one combination of two bodies can be obtained, it must be presumed to be a binary one, unless some cause appears to the contrary.' To prove this rule, he said, 'in all the combinations of hydrogen and oxygen, the parts of each is considered as one to eight. As the composition of hydrogen and oxygen is formed of oxygen, either of these elements may be selected as unity, and, in fact, as we shall hereafter notice, both have been occasionally employed as such. Dalton fixed on hydrogen, because it is that body which unites with others in the smallest proportion; thus,
Then, we have water composed of one hydrogen by weight, or one atom, and eight of oxygen by weight, or one atom, and in all cases an atom of hydrogen being represented by $1$, an atom of oxygen will be represented by $8$; and these being the atomic weights of each of its elements, that of the compound will be obtained by adding them together, thus:

<table>
<thead>
<tr>
<th>Element</th>
<th>Atomic Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hydrogen</td>
<td>1</td>
</tr>
<tr>
<td>Oxygen</td>
<td>8</td>
</tr>
<tr>
<td>Water</td>
<td>9</td>
</tr>
</tbody>
</table>

The weight, then, of a compound atom is obtained by adding together the atomic weights of its constituents. Although many elements may have units with hydrogen, there are some which do not, but there is no one which does not combine either with hydrogen or with oxygen: when, therefore, the hydrogen standard or unit fails on this account, we use the atomic weight of oxygen, and determine the weight of the substance in question, supposing only one compound to be formed, units with eight parts by weight, or one atom of oxygen. Now cadmium is a metal of this description; it forms no compound with hydrogen, and only one with oxygen, and as eight parts of this element unite with fifty-six of the metal, to form the known oxide of it, we say that the atomic weight of cadmium is fifty-six, and that the oxide is composed of

<table>
<thead>
<tr>
<th>Element</th>
<th>Atomic Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oxygen</td>
<td>8</td>
</tr>
<tr>
<td>Cadmium</td>
<td>56</td>
</tr>
</tbody>
</table>

Cadmum oxide $1$ atom $= 64$

It is, however, possible, though by no means probable, that such an inference may be incorrect, for the oxide in question may be composed either of two or more atoms of oxygen united with one atom of the metal, or the contrary, instead of what is assumed here, but the error may be detected by examining the proportion in which the metal unites with the elements, whose atomic weights are already determined. The atomic weights of sulphur, chlorine, and cadmium are respectively $16, 36,$ and $46:$ now, if in a series of combinations with these substances, the compounds containing the largest proportion of metal were constituted of

<table>
<thead>

</tr>
<tr>
<td>Metal</td>
<td>192</td>
</tr>
</tbody>
</table>

Sulphur $16$ Chlorine $36$ Selenium $48$

Sulphur $16$ Chlorine $36$ Selenium $48$

we should then conclude, as agree with the composition of the oxide, as above given, that $56$ is the atomic weight of the metal. But if it was found that the compounds in question containing the largest proportion of metal were constituted of

<table>
<thead>
<tr>
<th>Element</th>
<th>Atomic Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sulphur</td>
<td>16</td>
</tr>
<tr>
<td>Chlorine</td>

<tr>
<td>Metal</td>
<td>192</td>
</tr>
</tbody>
</table>

we must then consider the oxide composed of $8$ oxygen and $56$ metal as a suboxide, constituted of $1$ atom of oxygen $= 8$ atoms of cadmium $= 56$.

This method of proceeding is according to the rule thus laid down by Dr. Dalton. 'It is necessary not only to consider the combinations of $A$ with $B$, but also those of $B$ with $A$, $C$, $C$, etc., as well as those of $B$ with $C$, $D$, &c., before we can have the confidence to say with one determination as to the number of atoms which enter into the composition of the compound.' (New System of Chemical Philosophy, vol. ii. p. 306.)

In fact, the protoxide of a metal, i.e. $1$ atom oxygen $+ 1$ atom metal, may possess such properties as to prevent its composition from being by direct means accurately ascertained; and it is likewise possible that no protoxide may exist.

We have alluded to the circumstance, that various compounds of the same two elements may exist, and suppose an elementary body, as copper or silver, united with two proportions of oxygen, various questions may arise as to the constitution of the resulting oxides: as, whether that which contains least copper is a suboxide; that protoxide; or whether that which contains most is a protoxide or a peroxide. These are points which can be determined only by comparison.

**Example:**

For, example, with respect to oxygen and copper, that oxide which contains least oxygen consists of $8$ oxygen $+ 64$ metal; that which contains most, of $16$ oxygen $+ 64$ metal; now, in this case, we consider that which contains least oxygen as composed of each of its elements, and that which contains most oxygen as formed of $2$ atoms of oxygen $+ 1$ atom of copper—thus:

<table>
<thead>
<tr>
<th>Element</th>
<th>Atomic Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oxygen</td>
<td>8</td>
</tr>
<tr>
<td>Copper</td>
<td>64</td>
</tr>
</tbody>
</table>

Copper oxide $1$ atom $= 64$

While the protoxide of copper $= 78$

This rule of assuming that oxide to be a protoxide which contains least oxygen will be generally found correct, especially when confirmed, as it is in this instance, by the corresponding constitution of the two chlorides and two sulphates. The oxides of silver, however, form an exception, though a very rare one, to this rule; there are two oxides of this metal composed of

<table>
<thead>
<tr>
<th>Element</th>
<th>Atomic Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oxygen</td>
<td>8</td>
</tr>
<tr>
<td>Silver</td>
<td>116</td>
</tr>
</tbody>
</table>

If it were to be assumed in this case, that $165$ is the atomic weight of silver, because it is the largest proportion which contains with $8$, or $1$ atom of oxygen, the assumption would be erroneous, for this oxide has no corresponding chloride, sulphate, &c., and it would be unlike other protoxides, in forming no compound with any acid. But all these properties belong to the oxide of silver composed of $8$ atoms of oxygen and $10$ silver; in this case the oxide containing most metal is considered as a protoxide, composed of $2$ atoms oxygen $+ 3$ atoms silver $= 30$. To generalize this rule the rule may be relied upon, that the metallic oxide which contains least oxygen is the protoxide, and that weight of the metal which combines with $8$ by weight of oxygen, denotes the weight of its $2$st, and their united weight of the oxide.

It will be observed, with respect to the compounds of oxygen and copper, that the second portion of that element which unites with one of the same quantity of the metal, is double the first. Now upon this foundation is founded one of the most important and beautiful peculiarities of Dr. Dalton's theory, sometimes described as the doctrine of the multiplier. In the case just alluded to, the second portion of oxygen is precisely double the first; but there are some cases in which the greater proportions are not multiples of the less, by any entire number: for example, there are two well-known oxides of iron consisting of

<table>
<thead>
<tr>
<th>Element</th>
<th>Atomic Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oxygen</td>
<td>8</td>
</tr>
<tr>
<td>Iron</td>
<td>28</td>
</tr>
</tbody>
</table>

The first of these is the protoxide, and the second the peroxide; but it will be observed, the second of oxygen is only one-half greater than the first, instead of double, as happens with respect to copper. In fact, the multiplication is equal to only half an atom of oxygen; but as the number of dividing a number is not always divisible, the difficulty is overcome by multiplying both the oxygen and the iron, in which case we shall have $12 \times 8 = 24$, or $3$ atoms of oxygen, combined with $28 \times 2 = 56$, $3$ atoms of iron, and these proportions are perfectly consistent with the theory.

Other cases of apparent anomaly occur: thus there are three oxides of lead, viz.,

<table>
<thead>
<tr>
<th>Protoxide</th>
<th>Peroxide</th>
</tr>
</thead>
</table>

**Lead**

The first and last of these oxides are constituted exactly as the oxides of copper, are the second possessed of oxygen being double that of the first; but the red oxide of lead is composed of an atom of metal and such a quantity of oxygen as is equal to one atom and a third. If, then, both the oxygen and metal be multiplied by $3$, we have a compound of $4$ atoms of oxygen and $3$ atoms of lead, or $32 + 315 + 324$, and it is found that these $344$ parts of red lead be treated as if they were only $224$, as is the case with protoxide $= 224$, which is dissolved, and $1$ atom of peroxide $= 129$, which remains undissolved, and is the state of a brown powder. This case, then, of apparent anomaly is removed by showing that the red oxide of lead is equivalent to, or perhaps composed of, the other two oxides, and is reducible into them.

The oxides of manganese offer a still more remarkable case of apparent irregularity of combination, and of the disposition of metallic oxides themselves to combine in definite proportions. There are five oxides of this metal, all of
which are resolvable into the protoxide and peroxide by the action of dilute sulphuric acid.

While on the subject of multiples, it will be proper to adduce one of the most remarkable and regular series of them presented to us. There are five compounds of oxygen and azote, viz.:

<table>
<thead>
<tr>
<th>Compound</th>
<th>Molecular Formula</th>
</tr>
</thead>
<tbody>
<tr>
<td>Nitrous oxide</td>
<td>( \text{O}_2 \text{N} )</td>
</tr>
<tr>
<td>Nitric acid</td>
<td>( \text{HNO}_3 )</td>
</tr>
<tr>
<td>Hyponitric acid</td>
<td>( \text{H}_2\text{NO}_3 )</td>
</tr>
<tr>
<td>Nitric acid</td>
<td>( \text{HNO}_4 )</td>
</tr>
<tr>
<td>Nitrous acid</td>
<td>( \text{H}_2\text{NO}_2 )</td>
</tr>
</tbody>
</table>

In these compounds, it will be observed, to form a new compound, 1 atom of oxygen in every case added to the preceding quantity, and the atoms of oxygen combined with 1 atom of azote are 1, 2, 3, 4, and 5.

When some cases the hydrogen and in others the oxygen standard is assumed, there are others in which they may be employed indifferently: thus, of carbon 6 parts by weight is the largest quantity which combines either with 1 part by weight of hydrogen, or 1 atom, or with 8 parts by weight of oxygen, or 1 atom; it is therefore the atomic weight of carbon. But with sulphur the case is different; 32 is the largest proportion that combines with 1 of hydrogen, but 16 is the greatest quantity that unites with 1 of oxygen: notably, as its atomic weight for 32 taken, as indicated by the hydrogen unit, we should have no compound of 1 atom oxygen + 1 atom sulphur, which would occasion much more inconvenience than results from the halving of having a subhydride of sulphur, or, which is the same, a sulphate of hydrogen.

With respect to azote also, the atomic weight is fixed at 14, that being the largest quantity which combines with 8 of oxygen. There is only one compound of hydrogen and azote, viz. consists of 3 parts by weight of hydrogen and 14 by weight of azote; consequently, if we had taken the hydrogen standard, the atomic weight of azote would have been \( 14 \div 466 \), which would have greatly complicated the constitution of the compounds of oxygen and azote; but the alternative of supposing ammonia to contain 3 atoms of hydrogen instead of 1 atom is of secondary importance, though it must be admitted that it contravenes the rule laid down by Dr. Dalton, that 'when only one combination of two bases can be obtained, it must be presumed to be a binary one.'

The case in which the second portion of oxygen in an oxide, instead of being equal to the first, is only one-half greater, has been pointed out in the instance of the oxides of nitrogen, where, by the laws of submultiples, the existence of an oxide instead of a halfof an atom is considered to have been overlooked. There are, however, some cases, in which it is convenient to consider such oxides as containing an atom and a half, where it was considered to contain an atom; there is also a case, in which there are several instances in which oxides are commonly considered as containing a quantity of acid equal to an atom and a half, and these are termed "sequequials." The alkaline oxides, potash, and soda, and some other bases, form those compounds with the same acid: for example, we have

<table>
<thead>
<tr>
<th>Compound</th>
<th>Molecular Formula</th>
</tr>
</thead>
<tbody>
<tr>
<td>Carbonate of potash, composed of 1 atom acid + 1 atom base</td>
<td>( \text{Na}_2\text{CO}_3 )</td>
</tr>
<tr>
<td>Bicarbonate of potash, 2 atoms acid + 1 atom do</td>
<td>( \text{NaHCO}_3 )</td>
</tr>
<tr>
<td>Bicarbonate of potash, 3 atoms acid + 2 atoms do</td>
<td>( \text{Na}_2\text{CO}_3 )</td>
</tr>
</tbody>
</table>

It is then evident that the last salt is equivalent to a compound of 1 atom acid + 1 atom base. Now if an atom of the second salt, be considered as a "sequequial", and the combining weight of nitrate of lime, double decomposition ensues, 1 atom of neutral nitrate of potash remains in solution, 1 atom of neutral carbonate of lime is precipitated, and carbonic acid equal to half an atom is expelled in the state of gas. With respect to its base, then, the combining weight of potash may be regarded as a neutral carbonate, though, as to its acid, as a sequequial; for if lime-water be added to an atom of a sequequial carbonate, carbonate of lime is precipitated equivalent to 1 atom.

These facts are sufficient to show that combining and atomic weights are not convertible terms, though they have been so employed. Thus the atomic weight of an anhydrous compound of 2 atoms carbonic acid and 2 atoms potash, is 167; considered as a sequequial carbonate, its atomic weight is 81; and its combining weight is the same with respect to an atom of nitric acid; but it is one-half greater as regards an atom of lime. The same remark will apply to bisalts; they must also be considered as having one combining weight for their acids and another for their bases.

It may now easily be made to appear how it happens that when two neutral salts decompose each other, the new salts obtained by the operation are also neutral; an atom of nitric acid weighs 44, and one of barytes 76, when combined 130 of neutral nitrate of barytes; 88 an atom of nitrate of potash is composed of an atom of sulphuric acid = 40, and an atom of potash = 48. Now when 136, or an atom of nitrate of barytes, dissolved in water, is mixed with a solution of 88, an atom of potash, double decomposition ensues, and two new and perfectly neutral salts are formed, viz., 1 atom of nitrate of potash = 102, consisting of an atom of nitric acid = 54, and an atom of potash = 48. In this remarkable solution, we have precipitated an atom of neutral sulphate of barytes = 96, and 1 atom of sulphuric acid = 40, and 1 atom of barytes = 76. The annexed diagram will show the constitution of the salts employed, and those formed by their mutual decompositions; it will be seen also that the weight of the new compounds is precisely equal to those of the original salts.

Although the atomic theory, thus developed by Dr. Dalton in 1808, contained truths of the highest importance, quite independent of the hypothesis by which it was illustrated, it was not until after the appearance of Dr. Wollaston's Memoirs, On Super-acid and Sub-acid Salts, and On a Synoptic Scale of Chemical Equivalents, that chemists were fully impressed with the practical applications of which the theory was susceptible. In the first memoir (Phil. Trans, 1808), a memoir equally remarkable for its conciseness and clearness, Dr. Wollaston shows, that Dr. Dalton's theory, first applied to determining the constitution of gaseous bodies, is applicable to that of super-acid and sub-acid salts; and he proves that sub-carbonate of potash contains exactly half the quantity of carbonic acid existing in the super-carbonate, by showing that if the latter be acidified, it loses half its acid, and is reduced to the state of sub-carbonate by the loss; the same rule was found to exist with the sub-carbonate and super-carbonate of soda, the sulphate and super-sulphate of potash, and with three oxalates of potash.

The paper on the synoptic scale appeared in the Phil. Trans, for 1814. By this instrument the practical utility of the doctrine of definite proportions was most satisfactorily pointed out. This instrument consists of a movable scale of numbers on the principle of Gunter's scale, so that any number can be placed opposite the names of a series of substances in adjoining columns, arranged in the order of their combining weights; and if one number denote the combining weight of a body being placed opposite the name—10, for example, opposite to oxygen—the numbers expressing the combining quantities of others will appear opposite to their names; thus copper will be found opposite to 40, showing that this quantity of it combines with 19 of oxygen, and opposite to 50 will be found oxide of copper. By mere inspection, a great number of important results are obtained. If the composition of a substance with regard to its proportions to its elements is to be determined, the slider is to be so placed that the number 100, or any required number, is opposite to its name, and the respective quantities of the ingredients will be found opposite to their names, and the quantities of other compounds required to decompose them: for example, when placed opposite to sub-carbonate of potash, 37.5 will be opposite to carbonic acid, 59.1 to potash, 61.3 to oil of vitriol, 50 to dry sulphuric acid, and 11.3 to water.
and one volume of the vapour of carbon; and so with all other gaseous compounds of carbon.

Dr. Turner (Elements of Chemistry, p. 264) has well observed, that the simple rule in which volumes combine is peculiarly interesting, because it appears to indicate a close correspondence in the size of the atoms of gaseous bodies. It naturally suggests the idea that this peculiarity may arise from the atoms of elementary principles possessing the same magnitude. On this supposition, equal volumes of such substances in the gaseous form, at the same temperature and pressure, would probably contain an equal number of atoms, and the relative weight of a solid or liquid would depend on the relative weight of their atoms. The same numbers which indicate the specific gravity of elementary principles in the gaseous state would then express the relative weight of their atoms, so that the latter would be ascertained by means of the former, or the atomic weight of a solid or liquid represent the specific gravity of its vapour. The proportional numbers adopted by Sir H. Davy in his Elements of Chemical Philosophy, and the atomic weights employed by Berzelius in his System of Chemistry, were selected in accordance with this view. Thus, water, being formed of two measures of hydrogen and one measure of oxygen, is believed by Berzelius to consist of two atoms of the former, and one atom of the latter; and, for a similar reason, he considers the two atoms of nitrogen and one atom of oxygen. The atoms and volumes of the four elementary gases—oxygen, chlorine, hydrogen, and nitrogen—are thus made to coincide with each other. This method, though perhaps preferable to any other, has considerable faults. The chemists consider water, protoxide of chlorine, and protoxide of nitrogen, as containing each one atom of their elements; and, consequently, as those compounds consist of one measure of oxygen united with two measures of the other constituent, the atoms of oxygen must be supposed to occupy twice as much space as an atom of oxygen. An atom of oxygen is therefore represented by half a volume, and an atom of the other three gases by a whole volume.

In 1815, Dr. Prout published, in the sixth volume of the Annals of Philosophy, a paper 'On the Relation between the Specific Gravities of Bodies in their Gaseous States, and the Weights of their Atoms.' The observations offered in this memoir were the basis of his doctrine on the size of volumes just described. The author shows, that if atmospheric air be a compound of 80 volumes of oxygen and 20 of atomic gas, and their equivalents 8 and 14, then the specific gravities of these gases are—oxygen, 1:11; atomic gas, 0:925. Water weighs 0:9999; and hydrogen is 0:0894; that if we reckon the atomic weight of hydrogen 1:125, that of oxygen is unity. He also observed, that the atomic weights of bodies appear to be multiples of the atomic weight of hydrogen by a whole number. It was remarked by him, that in general the specific gravity of the body in a gaseous state may be obtained by multiplying its atomic weight by 0:9588, or half the specific gravity of oxygen gas, because the atom of oxygen is represented by half a volume, but that of most other substances by a whole volume.

Dr. Thomson (Attempt to establish the First Principles of Chemistry by Experiment, vol. i., p. 94), fully adopting Dr. Prout's views on this subject, says—'Every substance, of which I have procured a sufficiently quantity to enable me to examine it fully, has been not only a multiple of the atomic weight of hydrogen; but, if we except a few compounds into which a single or odd atom of hydrogen enters, they are all multiples of 0:25, or of two atoms of hydrogen. On this method of suspecting the truth of the views now before me, it will be evident that such a law would afford great facilities, as all fractional numbers would be avoided, hydrogen being reckoned unity. In this country the idea has been pretty generally adopted, and in this method of suspecting the atomic weight of substances we have been, however, been confused, as we have been by the researches of Dr. Turner, have thrown, to say the least, very great doubts on the accuracy of the general proposition made by Dr. Prout concerning the atomic weights of the elements.'
Before giving a table of the atomic weights of elementary bodies, it is proper to state the nature and weight of the standard from which they are reckoned, and the different terms employed to designate what—adopting the language of Dr. Dalton—we have described as an atom.

Dr. Dalton, *atom*, hydrogen 1 oxygen 8.

Dr. Thomson, *atom*, oxygen 1 hydrogen 2.

Berzelius, *atom*, oxygen 100 hydrogen 125.

Dr. Henry, *atom*, hydrogen 1 oxygen 8.

Dr. Turner, *equivalent*, hydrogen 1 oxygen 8.

Mr. Faraday, *proportional*, hydrogen 1 oxygen 8.

Mr. Brans, *proportional*, hydrogen 1 oxygen 8.

The method of mutually converting the numbers of each standard into those of the other is too obvious to require explanation.

The use of the term atom has been objected to as hypothetical, because it is said that we have no means of ascertaining or judging the weight or magnitude of an atom of any element, and that any supposed relative weight of their atoms must therefore be a mere hypothetical assumption, from which no satisfactory conclusions can be drawn; and that it is better to confine ourselves to elements, terms, as above quoted, are substituted for the word atom, which is, however, intended to express merely the smallest division which is found of any element without decomposition.

The following remarks by Dr. Wollaston, in his memoir on the finite extent of the atmosphere (Phil. Trans. 1832), are strongly in favour of the atomic constitution of matter.

Dr. Thomson has, however, objected to this opinion, that the product of the weight of an atom by the corresponding capacity for heat of that atom is not a constant quantity; but that the weight of the same substance varies with change of form, or with variation of temperature without change of form. Added to which the weights of the atoms, as indicated by the specific heat, would be very materially different from those now adopted in many cases.

The beautiful experiments of Mr. Faraday on the absolute quantity of electricity associated with the particles or atoms of matter, prove that, for a given definite quantity of electricity passed, an equally definite and constant quantity of water or other matter is decomposed; and he concludes also, that the electricity which decomposes, and that which is evolved by the decomposition of, a certain quantity of matter, are alike. ‘The harmony,’ he observes, ‘which the theory of the infinite evolution and the infinite definate action of electricity introduces into the associated theories of definite proportions and electro-chemical affinity, is very great. According to it, the equivalent weights of bodies are simply those quantities of them which contain equal quantities of electricity, or equal quantities of electricity from equal electric powers; it being the electricity which determines the equivalent number, because it determines the combining force. Or, if we adopt the atomic theory or phraseology, then the atoms of bodies which are equivalents in each other in their ordinary chemical action have equal quantities of electricity naturally associated with them.’ (Phil. Trans. 1834.)

With respect to the utility of the atomic theory, we cannot do better, in considering this account of it, than to state, in the words of Dr. Daubeney (*Introduction to the Atomic Theory*, p. 87), that ‘it would be superfluous to enlarge upon the proofs already afforded, with respect to the greater precision it has introduced into the science—the wonderful saving of time and labour which is derivable from it, only by the philosopher in his more speculative inquiries, but even by the manufacturing chemist, in the every-day operations of his trade.’

It is evident that, in the present state of our knowledge, no sooner have we attained the exact proportion in which a new substance unites with any one of those bodies whose atomic weight is already determined, than we are enabled to calculate in what quantities it must combine with all the remainder, so that, instead of being required to repute every new occurrence would have appeared necessary, to analyze every existing combination, in order to determine the proportion of its ingredients, we might rest contented, were it not for the sake of obviating the chances of error in any single experiment, with ascertaining the composition of the out of

It is to be observed, that it is not ponderable matter only which appears to obey the law of definite proportions; strong and Peter have inferred from the experiments of Maas, de Ch. et de PA. (vol. x.) that the atoms of simple substances have the same capacity for heat. Dr. Dalton has, however, objected to this opinion, that the product of the weight of an atom by the corresponding capacity for heat is not a constant quantity; but that the capacity of the same substance varies with change of form, or with variation of temperature without change of form. Added to which the weights of the atoms, as indicated by the specific heat, would be very materially different from those now adopted in many cases.

The late beautiful experiments of Mr. Faraday on the absolute quantity of electricity associated with the particles or atoms of matter, prove that, for a given definite quantity of electricity passed, an equally definite and constant quantity of water or other matter is decomposed; and he concludes also, that the electricity which decomposes, and that which is evolved by the decomposition of, a certain quantity of matter, are alike. ‘The harmony,’ he observes, ‘which the theory of the infinite evolution and the infinite definite action of electricity introduces into the associated theories of definite proportions and electro-chemical affinity, is very great. According to it, the equivalent weights of bodies are simply those quantities of them which contain equal quantities of electricity, or equal quantities of electricity from equal electric powers; it being the electricity which determines the equivalent number, because it determines the combining force. Or, if we adopt the atomic theory or phraseology, then the atoms of bodies which are equivalents in each other in their ordinary chemical action have equal quantities of electricity naturally associated with them.’ (Phil. Trans. 1834.)

With respect to the utility of the atomic theory, we cannot do better, in considering this account of it, than to state, in the words of Dr. Daubeney (*Introduction to the Atomic Theory*, p. 87), that ‘it would be superfluous to enlarge upon the proofs already afforded, with respect to the greater precision it has introduced into the science—the wonderful saving of time and labour which is derivable from it, only by the philosopher in his more speculative inquiries, but even by the manufacturing chemist, in the every-day operations of his trade.’

It is evident that, in the present state of our knowledge, no sooner have we attained the exact proportion in which a new substance unites with any one of those bodies whose atomic weight is already determined, than we are enabled to calculate in what quantities it must combine with all the remainder, so that, instead of being required to repute every new occurrence would have appeared necessary, to analyze every existing combination, in order to determine the proportion of its ingredients, we might rest contented, were it not for the sake of obviating the chances of error in any single experiment, with ascertaining the composition of the out of

[G2]
ATONEMENT. a certain mode of appeasing anger, and obtaining pardon for an offence. In the act of atonement, there is commonly understood to be a substitution of some thing offered, or of some personal suffering, for a penalty which would otherwise be exacted. The word is, indeed, applied colloquially to any expiation by punishment, whether voluntary or involuntary, consequent upon criminal conduct or error of judgment. Thus even the spendthrift is said to have atoned for his folly by the hardships endured in consequence of it, and the murderer for his crime by a public degradation, which is commonly thought to make atonement for the words and actions altogether indefensible.

In theology, it has respect to offence committed against the Deity; it is in the theological acceptance of the term that it will be considered in the present article. The subject in this article is the atonement connected with sacrifice. A sacrifice (σαρκις, σαρκισμός); but it is not identical with it. For it is not certain that all sacrifices had atonement for their object; and sacrifice, as commonly understood, was only one amongst other methods of atonement.

The practice of atonement is remarkable for its antiquity and universality, proved by the earliest records that have come down to us of all nations, and by the testimony of antient and modern travellers. In the oldest books of the Hebrew Scriptures, without noticing those earlier sacrificial systems, we find that they may be ascribed to a great number of expiatory rites where atonement is the prominent feature, occupying, in fact, a large portion of the four last books of the Pentateuch. In some cases the atonement was even for a living, Lev. xx. 22, or in this manner: Lev. iv. The Hebrew records contain also notices of the practice of atonement, independent of the Mosaic institutions, and connected with the religious opinions of the Hebrew people. The barbarous offerings to Moloch appear in the light of atonement, as in the writing of the god of the Babylonians, in the book of the Maccabees. The same offerings are noticed by Polykrates, and given to the same purpose, by the expiation of the present sacrifice. In the case of the scape-goat, Lev. xvi. 22; in others it had reference to a state of transgression, as especially in the case of the scape-goat, on the day of expiation. (Lev. xvi.) The offender again either atoned by his own personal act, or received the benefit of atonement by the act of another. (Lev. xi.) The Hebrew records contain also notices of the practice of atonement, independent of the Mosaic institutions, and connected with the religious opinions of the Hebrew people. The barbarous offerings to Moloch appear in the light of atonement, as in the writing of the god of the Babylonians, in the book of the Maccabees. The same offerings are noticed by Polykrates, and given to the same purpose, by the expiation of the present sacrifice. In the case of the scape-goat, Lev. xvi. 22; in others it had reference to a state of transgression, as especially in the case of the scape-goat, on the day of expiation. (Lev. xvi.) The offender again either atoned by his own personal act, or received the benefit of atonement by the act of another. (Lev. xi.) The Hebrew records contain also notices of the practice of atonement, independent of the Mosaic institutions, and connected with the religious opinions of the Hebrew people. The barbarous offerings to Moloch appear in the light of atonement, as in the writing of the god of the Babylonians, in the book of the Maccabees. The same offerings are noticed by Polykrates, and given to the same purpose, by the expiation of the present sacrifice. In the case of the scape-goat, Lev. xvi. 22; in others it had reference to a state of transgression, as especially in the case of the scape-goat, on the day of expiation. (Lev. xvi.) The offender again either atoned by his own personal act, or received the benefit of atonement by the act of another. (Lev. xi.)

The practice of atonement is remarkable for its antiquity and universality, proved by the earliest records that have come down to us of all nations, and by the testimony of antient and modern travellers. In the oldest books of the Hebrew Scriptures, without noticing those earlier sacrificial systems, we find that they may be ascribed to a great number of expiatory rites where atonement is the prominent feature, occupying, in fact, a large portion of the four last books of the Pentateuch. In some cases the atonement was even for a living, Lev. ii. 12, or in this manner: Lev. iv. The Hebrew records contain also notices of the practice of atonement, independent of the Mosaic institutions, and connected with the religious opinions of the Hebrew people. The barbarous offerings to Moloch appear in the light of atonement, as in the writing of the god of the Babylonians, in the book of the Maccabees. The same offerings are noticed by Polykrates, and given to the same purpose, by the expiation of the present sacrifice. In the case of the scape-goat, Lev. xvi. 22; in others it had reference to a state of transgression, as especially in the case of the scape-goat, on the day of expiation. (Lev. xvi.) The offender again either atoned by his own personal act, or received the benefit of atonement by the act of another. (Lev. xi.) The Hebrew records contain also notices of the practice of atonement, independent of the Mosaic institutions, and connected with the religious opinions of the Hebrew people. The barbarous offerings to Moloch appear in the light of atonement, as in the writing of the god of the Babylonians, in the book of the Maccabees. The same offerings are noticed by Polykrates, and given to the same purpose, by the expiation of the present sacrifice. In the case of the scape-goat, Lev. xvi. 22; in others it had reference to a state of transgression, as especially in the case of the scape-goat, on the day of expiation. (Lev. xvi.) The offender again either atoned by his own personal act, or received the benefit of atonement by the act of another. (Lev. xi.)

In this case the offence was involuntary; yet it was not the less supposed to be an excuse to expose the offender to punishment. Here too is an instance of atonement unaccompanied by sacrifice. The mode, indeed, of atonement admitted an almost infinite variety. Even the repetition on a certain occasion of the great games at Rome was strictly an act of atonement for a rather singular offence described by Livy, lib. ii. c. 36.

If we pursue our inquiries through the accounts left us by the Greek and Roman writers of the barbarous nations we shall find the same notion and similar practices of atonement. From the most popular portion of our own literature, our narrators of voyages and travels, every one probably, who reads at all, will be able to find for himself the cases in which the atonement of the offender is universal. It shows itself among the various tribes of Africa, the islands of the South Seas, and even that most peculiar race, the natives of Australia, either in the shape of some offering, or some mutilation of the person. We should expect to meet with it in India, so fertile in every form of superstition; and it is certain that many of the fantastic and revolting rites of the Hindoos bear testimony to its presence. The favourite practice of torturing the body has often there a different object, that of acquiring the reality or the fame of superior sanctity; but undoubtedly it is also resorted to as a mode of atonement.

It has been supposed that the sacrificial rites of the heathens and their practice generally of atonement are but an imperfect remnant of a far more ancient and universal institution. It is an earlier period of the world, in a purer state of religious knowledge, and which indicated a consciousness of the actual relation in which man stood to his Maker, and painted darkly at the means by which an abomination of condition could be offered to be expiated. It would be impossible to avoid all but universally acknowledged by the believers in revelation, that the Levitical atonements were, in part at least, typical of that one great sacrifice on which the Christian religion is founded. The reforming party and limits of this publication do not allow us to consider this part of the subject at a length and in a manner suited to its importance. We can do little more than state what is understood by the Christian when he speaks of the atonement. He does not consider man, according to the heathen notion,
already mentioned, to be the object of a capricious and
wanton enmity, but through a sinfull nature, and practices
and affections conformable to that nature, to have come into
to a state of alienation from God; in other words, he believes
that God, in his wisdom, has so adjusted the details of his
being and condition, that man may never know when or
where he may be punished; this being his condition, he fur
ther believes that the Divine Being, revealed to us under
the title of the Son of God, interposed between the sentence
and its execution, suffered in our stead, and atoned by his
death for the imputations of sin, is the remission of the original
sentence, and restoration to a state which is still probationary,
but in which man is made capable of a permanent reunion
with his Maker. The be
lief in the doctrine of the atonement supposes that the sin,
which was imputed to Adam, and which is talked of as a fixed
and certain sin, is the sin of God (which law he also supposes to be
revealed to us) that sin must be atoned for before it can be par
doned; but he distinguishes between the necessity of the sacri
cifice itself, and the further purpose of God in causing it to be
publicly made, and providing that it should be uni
versally known. He supposes the knowledge of the fact to be
necessary to the formation of the Christian character, and
its moral consequences to be, a deeper sense of the
torment of sin; whereas there might otherwise be danger lest
that should be lightly accounted of which appeared to have
been lightly forgiven; and also a new and powerful motive
to a love of the Supreme Being, supplying a remedy for
the infirmities of all other love, which might otherwise have
resulted from the concurrence of those motives to obedience
were the hope of reward and the fear of punishment.

We have endeavored to state the doctrine of the Atonement
in such terms as would be accepted by all, who acknowledge
the doctrine of the Son of God and the sacrifice. It is
well known, however, that among those who would concur in the
general statement, there would be found minor differences of opinion, particularly as to the universal
extent of the sacrifice. [See Calvin.] We have also without qualification called the doctrine in question a doctrine of the Christian religion;
though we are well aware that there are some whose views of
the gospel dispensation and whose interpretation of scripture
may differ; whilst fully admitting the divine origin of our
religion, to reject as unscriptural the doctrine of the atonement.
But these would themselves readily acknowledge, we believe, that they are comparatively few in number.

With respect to some few in early times, such as
Theodotus the tanner, and Paulus of Samosata, we rather refer from their peculiar notions concerning the person
of Christ, than from any direct evidence, that they disented, in this particular point, from the general belief. The most profitable and useful topic of the doctrine
was then more fertile in unmeasured veneration than in full and clear statements of the opinions attributed to
opponents.

To those, according to the vulgar etymology, is to set at
one's ease, to reconcile; hence atonement is etymologi
gally explained at one-ment. Whether this derivation is
right or not, reconciliation seems to have been the primary
meaning of atonement with our earlier writers. Hence in
the authorized version of the New Testament the same word
which in 2 Cor. v. 19 is properly rendered reconciliation, is in Rom. v. 11 rendered atonement. The word, how
ever, soon came to bear the meaning in which it is now used;
and such is in fact its ordinary meaning in the au
thorities of a later date.

Atoo or Atowai, one of the group of islands in the
North Pacific Ocean, which was discovered by Cook on
his third voyage, in January, 1778, and which he named the
Sandwich Islands, in honour of the then First Lord of the
Admiralty.

Atoll is situated in 21° 37' N. lat. and 146° 20' W. long.
The island is ten leagues in length from east to west, and
is much broader at the east than at the west end. On the
eastern side the surface rises with a gentle ascension, but on
the western side there is a steep descent from the west side
elevations about the centre of the island, which is 7300 feet above the level of
the sea. The high ground is covered with lofty trees, the
foliage of which is very luxuriant, but the coast on the eastern side is nearly level, and nearly without
habitants. On the western side the land is fertile, and produces abundantly all the vegetables furnished by the
islands of those seas.

There is reason to believe that when Captain Cook first
arrived at Atooi the natives looked upon his visit as the
fulfilment of a tradition or prophecy, which led them to
expect the return among them of a chief who had long ago
disappeared, under mysterious circumstances, from the Andes, and whose
return in after times was foretold, when he should present himself on an island bearing coco-nut trees, and swine,
and dogs. Accordingly, as soon as the ships were anchored,
a priest repaired on board, and decorating Cook with red cloth, such as adorned their deities, offered him a cup
in the manner of sacrifice, and pronounced a long and
to the Europeans present, an unintelligible discourse.
When he landed, the people either withdrew respectfully
from sight, or prospered themselves on the ground before
him according to a known custom.

On the south-west side of the island, and about two
leagues from the west end, is a tolerably good roadstead and
watering-place, called Wymoe. To the eastward of this
anchorage a shoal projecta, on which are rocks and breakers,
and the road is exposed to the trade-wind.

Some strongly suspicious circumstances which occurred
at the time of Cook's first visit to Atooi, induced him to be
of opinion that the inhabitants were cannibals. The more
intimate knowledge we have since acquired of their habits and
dispositions leads to the belief that Cook was mistaken
in this respect. There is not the least trace of so barbarous
a custom to be discovered. It is doubtless true that human
sacrifices were offered by some of the people; but although a great part of their religious ceremonies con
sisted in feasting, it is not now believed that they use any
part of those human sacrifices.

When they were first discovered, each of the principal
islands upon the coast of South America was the possession of its own
Erie chief (of chiefs), and it was not until 1817 that this
island was finally conquered, and the whole of the seven
islands were brought under the dominion of King Ta
namewa.

Captain Cook computed the population of this island,
from such data as he could then obtain, at about 30,000;
but it has since been ascertained that this computation
was probably below the truth, and that the number of the
inhabitants is about 14,000. Cook's Third Voyage round the World; Vancouver's Voyage, vol. i.;
Voyage of H. M. Ship Blende to the Sandwich Islands in
1824, 1825.

ATONI, or ATAOII, a tribe of Nomadic Arabs,
placed, according to Burckhardt, between the Nile and the
Red Sea, in Middle Egypt, between 26° and 26° N. lat.
They border on the Ababde towards the south, with whom
they are enemies, and from whom they have taken away
several flocks of sheep. [1448.] In 1449, to the north of
Kenneh and Kossir on the Red Sea, which privilege the
Atöni now farm from the pacha. To the north, the Atöni
are bounded by the Maasy and the Beni Wassel Arabs,
who live on the borders of the province of Atöni, and north
wards toward Duffy. (Burckhardt's Travels in Nuba, and
Map.) [See Abami.

ATORKOU. [See Kurile Islands.]

ATRAGENE. [See Clematis.]

ATRATO is the name of a river in South America, in
the republic of New Granada, and in the department of
the Rio Cauca, of which latter it drains the northern part,
called the province of Chocó. It is formed by the union
to several small rivers, Rio Quito, Rio Andagoya, and Rio
Rio, which joins it in a more southern latitude, in 8° 15' N.
at., and soon join one another. It runs nearly straight
from south to north for upwards of 150 miles; its mouth
is in the bay of Chocó, the most southern part of the
Gulf of Darien, near 8° N. lat. Traversing a narrow valley,
which is embosomed between two ranges of high Andes, and for
two-thirds of the year is drenched by almost continual
rains, the Atrato brings down a greater quantity of water
than would be supposed from the length of its course;
and, according to the calculation of the observers, the
river is 2,200 feet wide. Just at its entrance into the sea
are seventeen small islands, lying in two lines. It is navigable
only for a short distance from its mouth for European
vessels.

The country drained by the Atrato and its affluents
is extremely mountainous, and does not contain a level tract
of any extent, except at its mouth. The mountains are
covered with forests almost inaccessible, and the narrow val-
leys, on account of the almost continual moisture of the air, are marshy, and so frequently overflowed, that the inhabitants find it necessary, in many places, to build their houses upon trees, in order to be elevated at some distance above the surrounding marshes, which are frequently inundated with the putrid waters. It therefore cannot be a matter of surprise that this country has remained in nearly the same condition in which it was at the beginning of the sixteenth century, when discovered by the Spaniards under Roderic de Guzman and Alvar de Ojeda. But as the adjacent mountains contain rich mines of gold, and the Atrato and all its affluents bring down from them gold dust, a few Europeans have settled on the banks of the river, who cause considerable quantities of gold to be mined by their slaves, who are working in the gold mines of the rivers. The native Indians, too, pay the taxes imposed upon them in that metal. The mines are at present not worked, and agriculture is almost entirely abandoned, though it is said that the valley contains many fertile tracts.

The Atrato river, which is also called Darien and Chocó, has obtained some historical celebrity: the first European settlement on the continent of America was founded not far from its mouth in 1516, by Vasco Nuñez de Balboa. It was called Santa Maria el Antigua, and abandoned for Panama in 1618, on account of the insalubrity of the air. At present its site is almost unknown.

In our times the Atrato has acquired another sort of celebrity, the means by which the only existing water-communication between the Atlantic Ocean and the Pacific has been effected. One of its sources, the Rio Quito, rises near the source of the Rio San Juan, or Rio de Nauyaca, and runs a hairy course through the Quebrada, and the Rupas. In this ravine the curate of the village of Novita made his parsonishers dig a little canal, which is navigable during the heavy rains, and thus the canoes of the Indians carry the cocoa, the most important of the agricultural products of the adjacent country, from the mouth of the Rio San Juan to that of the Atrato. This canal, which was made in 1788, unites two points, which are respectively on the Atlantic and the Pacific Ocean, and are about 12 degrees of latitude from one another. (Alcedo, Humboldt.)

ATRIUM, HATRIA Pice'na, a town of the province of Teramo or Abruzzo Uitra L., in the kingdom of Naples, situated on a hill near the river Matrina or Piomba, and between that and the river Vomano, and about four miles distant from the coast of the Adriatic. It is 12 miles S.E. of Teramo, and near, though not upon, the high road from Teramo to Naples. Atri gives the title of Duke to a Neapolitan family. The ancient Hatria was once of considerable importance; it is included by the Roman geographers in the province of Picenum, being in that part of it which was inhabited by the Praetutii. It was called Hatria Picena, to distinguish it from the Hatria or Hatria of the Veneti. (See Apulia.) They were both colonies of the Etruscans, who had also in the Picenum the colonies of Cupra Maritima and Cupra Montana. Medals and coins have been found near Atri bearing effigies of fishes, anchors, and other marine symbols, with the legend HAT. The harbour of Hatria was at the mouth of the river Matrinius. The Syracusans, in the time of the elder Dionysius, sent a colony to Hatria, and some of the coins of that town are marked with the Pegasus, which was the symbol of Syracusans. (Delphi, Numismatica della città d'Atri nel Piceno.) Philistus, the historian, being banished from Syracusus by the elder Dionysius, took refuge at Hatria (Eic rör 'Adiaw), which we must suppose to be Hatria Picena, as this town had received a Syracusan colony: here he probably wrote the greatest part of his history. (Plutarch, Dion. xi.) Hatria afterwards became a Roman colony. The family of the Emperor Hadrian was originally from this place. (Spartian. Hadrian.) From the ancient town hardly anything remains now. The present town of Atri is a small and poor place; it was once surrounded by walls, which have partly fallen to ruin.

ATRIUM, or ATRIUM, a village in Lower Egypt, near the eastern branch of the Nile. It is the Atrites (populi Atrici, Lib. 1663); borders of stone, which have been observed here, probably indicate the site of a temple, parts of which may still be buried.

ATRISKO, or ATRIKANISKO, one of the four large islands in the icy sea, which lie off the coast of Siberia, and to which the name of New-Siberia, or Lacchoff islands, has been given. (See New Siberia.)

ATRIOUM, a hall or room of audience in a Roman house. The two words, Atrium and Caueodium, if not at first synonymous, most probably became so in the course of time. It appears from a passage in Varro, that the Cauveodium, or Cauveum Abdium, 'the hollow of the house,' must be the whole area between the rim of the compluvium from which the rain fell, and the impluvium into which the rain fell. The Atrium, properly so called, and as at first distinguished from the Cauveodium, would be the space between the open area and the walls (parietes) of the Atrium: thus the Cauveum Abdium would be the hollow space open to the sky and rain, while the Atrium would be the covered part, and would therefore form the hall or room of audience. If our conjectures, founded on this obscure passage of Varro, descriptive of the parts of a Roman house, be correct, we would suggest that the compluvium means rather the rim or gutter from which the rain fell [see House, Roman House] than the whole area of the open space over the impluvium.

The term Atrium is derived, according to Varro (Ling. Lat. iv.), from the Atriates, a people of Tuscany, from whom the pattern of it was taken. It was the most important and usually the most splendid apartment of a Roman house. Here the owner received his crowd of morning visitors, who were not admitted to the inner apartments. Originally the Atrium was the common room of resort for the whole family—the place of their domestic occupations; and such it probably continued in the humbler ranks of life. It consisted of a large apartment roofed over, but with an opening in the centre, called compluvium, towards which the roof sloped so as to throw the rain-water into a cistern in the floor called impluvium. Vitruvius distinguishes five species of Atria.

1. Tuseanum, or Tuscan Atrium, the oldest and simplest of all. It was merely an apartment, the roof of which was supported by four beams crossing each other at right angles, the included space forming the compluvium. Many of these remain at Pompeii.

2. The Tetrasyle, or four-columned Atrium, resembled the Tuscan, except that the girders, or main beams of the roof, were supported by pillars, placed at the four angles of the impluvium. This furnished means of increasing the size of the apartment.

3. The Corinthian Atrium differed from the Tetrasyle only in the number of columns and size of the impluvium. A greater proportion of the roof seems to have been left open.
ATROPA. A genus of dicotyledonous plants belonging to the natural order Solanaceae, and consisting for the most part of poisonous species. It is distinguished from other genera of the same natural order by its regular bell-shaped corolla, its five-parted permanent calyx, which never acquires a bladdery appearance, and by its succulent fruit. The species of most common occurrence is the following:

Atropa belladonna, deadly night-shade, or dわle, is found not unfrequently in thickets and hedges in this country. The whole plant is of a lightish green colour, except the flowers, which are large and of a dingy brownish-purple, and the berries, which are of the rich deep black of black cherries. The root is perennial, the stem grows about two feet high, and the leaves are acute, with an obtuse figure, tapering to each end. The flowers are bell-shaped, larger than those of the harebell, and placed singly in the bosom of the leaves. The border of the corolla is cut into five equal lobes; there are five stamens, a tapering pistil with two cells, and many seeds in the ovary, a long slender style, and a flattened stigma slightly divided into two lobes. The odour of the whole plant is nauseous and oppressive, as if to warn us of its venemous nature. It is in the leaves, root, and berries that the poison resides, and particularly in the berries, which, from their resemblance to cherries, have often been eaten by children, with fatal consequences. The active property of belladonna, though most commonly remarked in the fruit, exists also in the leaves, and especially in the roots, both of which have the same property.

They have nevertheless been frequently employed medicinally, and extract of belladonna is one of the most energetic preparations in the modern materia medica.

Arctopha Mandragora, or mandrake, is another species still more venomous and dangerous than the last. It is found in many parts of the south of Europe, particularly in the Grecian islands, where it is common. Its root is a large dark-coloured fleshy mass, often divided into two or three forks, which have been fancied to resemble a human body; this circumstance, and its well-known poisonous qualities, gave it, in the days of popular ignorance and credulity, the reputation of being endowed with animal feelings; the roots were said to shriek when torn from the earth, and it was accounted dangerous to disturb them. Even now the young Greeks are said by Sibthorpe to wear small pieces of them as love-charms. This remarkable plant has no appe-
This species is admitted into the Pharmacopoeias of this country, and is employed in the form of dried leaves, or of an extract. Its action on the human system differs according to the quantity taken. If the dose be small, a quickening of the heart's action follows, and an increased quantity of blood is sent to the brain. In this case it has a stimulating effect; but if the dose be larger, though some stimulating action is for a short time apparent, a sedative effect of a very powerful kind ensues. During the first stage, excitement of the heart, the brain, and the intellectual faculties, is manifest: this is succeeded by greatly diminished sensibility, perhaps most markedly observable in the extreme dilatation of the pupil, and the insensibility of the stomach to the stimulus of emetic substances. The spinal cord would appear not to be directly influenced by the drug, but to suffer at last from the impaired state of the function of respiration, and the consequently deteriorated condition of the blood. Convulsions, therefore, only occur late in cases of poisoning by this article. It deserves to be remarked, that the delirium accompanying the action of an overdose of belladonna is always of a gay, elevated kind; a red eruption, or efflorescence, on the skin is also generally observable. The nausea and vomiting are unaccompanied with much pain of the stomach; nor do the stomach and intestines present many traces of inflammatory action. The nausea and vomiting seem to be the result of the condition of the circulation in the brain, the gorged state of the vessels of which is rendered obvious by inspection after death.

The action of belladonna is ascribed to an alkaloid which it contains, called atropia, which exists in combination with maleic acid.

The cases in which belladonna may be advantageously employed are, diseases of increased sensibility of the nerves, particularly local affections of these, such as tic douloureux and other pains. It has also been recommended for the cure of scrofulous and cancerous tumours, and is employed to dilate the pupil in certain states of diseases of the eye. In the first set of cases, it may be employed either internally or externally. In tic douloureux, given internally along with arsenic acid, it often affords speedy and lasting relief. In the passage of gall-stones through the gall-duct, stones from the kidney, applied externally over the painful part, it gives great ease.

Its employment in cases of scrofulous and cancerous enlargement of the glands is likewise either internal or external. That it relieves the pain attendant on such affections is unquestionable; but it cannot be used to effect the cure of these with safety. It undoubtedly changes the process of deposition throughout the whole body, and also in morbid structure, into one of absorption—as is proved by the diminished solidity and increased fluidity of the body, as observed in cases of poisoning by it, where the great quantity of fluids favours the decomposition of the bodies which have died from its influence, and in which putrefaction always takes place very soon. But an equal degree of benefit may be obtained from the employment of antimonal preparations, without the danger which attends the use of this plant.

Its employment in the form of extract rubbed over the eyelids, to dilate the pupil previous to the operation for cataract, is an usual step, but requires caution: the same remark is applicable to its use in the form of solution dropped into the eye during inflammation of the iris. In both these cases it is liable to be absorbed in too great a degree, and cause alarming symptoms.

Belladonna has been recommended as a useful sedative in the latter stages of hooping-cough. But though it lessens the violence of the spasmodic action, the same degree of benefit may be obtained from hydrocyanic acid, without the liability of inducing that action of the vessels of the brain which ends in hydrocephalus. (See Gelse on Hydrocephalus.) Belladonna has also been proposed as a preventive of scarlet fever; but it is by no means certain to ward off this disease, while it is almost sure to induce hydrocephalus. Other preventive measures of a safer kind should therefore be had recourse to.

In case of poisoning by it, if taken into the stomach, the most immediate means should be employed to remove it. For this purpose the stomach-pump is best. Emetics can seldom excite the stomach to any expulsive action; in ordinary instances, fourteen grains of tartrate of antimony have been given without any effect.

Vinegar should not be given so long as any of the bella-
4. But the food when digested has a long course to travel before it reaches the blood. It must be taken up by the lactic vessels, and be carried through the mesenteric glands. [See Digestion.] It is probable that these organs are not mere channels of communication between the stomach and intestines and the lungs, but that they enforce some change upon the imperfectly-digested aliment, as it passes through them. Certain it is that disease of these organs powerfully influences the process of nutrition, and produces a great degree of wastage. Examples of this are too abundant in infants and children to be passed over in great numbers by diseases which, on examination of the body after death, are found to have their chief seat in these organs. [See Malaria.]

5. Disease of the organs of assimilation interrupts nutrition just as effectually as disease in the primary organs of digestion. It is not until the digested aliment reaches the lungs that it is converted into blood. The lungs finish what the stomach begins; and the function of respiration is the completion of that of digestion. Any thing that impairs the function of respiration must therefore necessarily impair that of nutrition, and produce a proportionate degree of wasting. The lungs have this peculiarity, that they are the first to be attacked by the process of degeneration, the obliteration of one part after another, in successive operations: the parts oblitered of course cease to contribute their share to the conversion of the aliment into blood; but the parts not oblitered continue to do so pretty much as in health, and it is possible to breathe the atmosphere, one lung, or with only half a lung; and the flame of life may, for a short time, be barely kept alive by a portion of even half a lung. The consequence is that, in certain instances of the lungs, emaciation is carried to the utmost extent which no means can be compatible with the maintenance of the smallest particle of life.

6. But the process of nutrition is not completed even after the aliment is converted into blood. There still remains what may be termed the function of appropriation. After their conversion into blood in the lungs, the new particles are returned to the left side of the heart, whence they are carried out to the system by the larger trunks of the arterial vessels. These tubes terminate in a system of vessels of extreme minuteness, called the arterial capillaries, which are the true appropriators of the new particles prepared for them in the lungs, the architects and masoms of the system, by which the new particles are deposited in the room of the old in the respective organs, and by which the waste is repaired. If the capillaries of the system fail to perform their duty, no matter what quantity or what quality of nutritive matter be brought to them, the function of nutrition is suspended, and the body wastes; and, in the same manner, if, by some external or internal cause, the nutrition of that particular part be at an end, and consequently its bulk diminish.

7. It is chiefly in consequence of the disease of these capillary vessels that acute diseases, such as inflammation and fever, are accompanied. It is on this account, i.e., the fact of wasting, although there is always, combined with this, disturbance of the digestive functions; so that in acute diseases nutrition is interrupted in a two-fold mode, by diminished digestion, and by imperfect appropriation of what is digested.

8. But a due supply of nervous influence is as indispensable to nutrition as a due supply of arterial blood. Whenever therefore the capillary vessels do not receive their proportional share of nervous influence, the waste continues to exceed the production; whatever injures the nerves in such a degree as to impair their functions is invariably found to occasion atrophy. If the nerves which supply a part waste, that part immediately begins to diminish in bulk: if a part has been long wasted, the nervous supply is so small that they can scarcely be traced. If the head of an unremoved diseased bone press upon the large trunk of a nerve, the parts to which the nerve is distributed waste. If a poison causes a disease of the nerves, as lead, by groaning and slowly introduced into the system, the body wastes; an example of which is seen in the atrophy commonly attendant on the disease termed the colica pectoris, the colic of painters. As will be sufficiently shown elsewhere, this is exactly the remedy of nerves that supplies the nervous influence indispensable to nutrition. Injury to the sentient system may indeed occasion atrophy; but it produces this effect indirectly;
whereas injury of the organic system produces it directly, by arresting the nutritive functions: and accordingly, the degree of atrophy arising from diseases of the brain and spinal cord is always very much less than that which is consequent on destroyed or impaired function of the organic sense.

9. Finally, cessation of function, from whatever cause, is manifestly and invariably followed by wasting of the organ in which the function had its seat. The gland that does not secrete, the eye that does not receive and transmit impressions, or convey its wrought stimulus, wastes; and the muscle that does not contract dwindles away; while increased exercise contributes exceedingly to the augmentation of its volume, as we see in the bulk of the arm, and the eye, and the leg of the opera-
dancer. From the complete and long-continued cessation of action, the substance of organs is sometimes almost entirely removed; nothing remaining by which its original structure can be distinguished.

Such are the most obvious and common causes of wasting, the detection of which, it is obvious, must precede any rational treatment of the affection. It can be cured only by the application of the appropriate remedy to the morbid state of the organ of disease; or if that has not been discovered, by the cause will easily and surely remove the malady.

ATROPIA, a vegetable alkaloid discovered by Brandes in the juice of the atropa belladonna, and in which the well-known poisonous qualities of the plant reside. It may be obtained by treating the decoction of the weed with naphthenic and volatile acids, and digesting the precipitate in alcohol, which dissolves the alkaloid in question. Brandes procured it also by adding sulphuric acid to the decoction, filtering the solution, supersaturating with potash, filtering again, dissolving the precipitate in boiling water and crystallizing the solution.

The crystals are long, transparent, colourless, brilliant needles. Atropa is insoluble in cold water, and very slightly dissolved by water and boiling alcohol. It forms with 99 per cent of the solvents readily crystallizes; and the saturation power is so great, that 107.5 parts of it neutralize 100 parts of sulphuric acid. During the evaporation of a salt of atropa, so great a quantity of it is evaporated, that the vapour occasions an enlargement of the pupil of the eye and its inflammatory action continues several hours. Brandes supposes that the atropa exists, in part at least, in the state of malate in the plant. When atropa is heated in a solution of potash or soda, ammonia is abundantly evolved.

According to Liebig, this alkaloid consists of

ASTHIINSK, or ACHINSK, a very thriving town, formerly the capital of the circle of that name, but at present occupied by the city of Kazan, in the province of Tobolsk, in Siberia. It is situated on the Atash and Tobolya, the latter of which, on leaving the town, runs in a northerly direction, until it falls into the Ob. It lies at a distance of about 390 versts (240 miles) from Tobolsk, and about 200 versts (130 miles) from Tomsk, in 54° 32' N. lat., and 90° 56' E. long. (Beau.) Though only founded in 1792, it is gradually becoming an important place of transit for inland trade, and takes so small share in the traffic of the Ob and Tobol, that to the greatest extent of communication with Tobol through the Ob and Tobolva.

The ascus in vesicula is so fertile a description, that the seed soon on it usually produces thirty-fold; husbandry is only the principal pursuit of the inhabitants, who supply largely in corn and all the necessaries of daily life, and are happy when they possess any of their own growth. The inhabitants consist either of criminals or Telesium Tartars.

ATTACA, in nuncia (Ital. to speak for), denounces, that the next momentum is to follow immediately, without any pause. In the language of the old contrapuntists, attaco signifies a short, irregular subject, not liable to the severe laws of fugue.

ATTACHMENT, FOREIGN. This is a judicial proceeding, by means of which a creditor may obtain the security of the goods or other personal property of his debtor, in the hands of a third person, for the purpose, in the first instance, of enforcing the appearance of the debtor to answer to an action; and afterwards, upon his continued default, of obtaining the goods or property absolutely in satisfaction of the debt. The remedy in England is limited entirely upon local customs, and is an exception to the general law of the land.

It exists in London, Bristol, Exeter, Lancaster, and some other towns in England; and a mode of securing the payment of a debt by a proceeding against the goods in the hands of a third person, is resembling the pro-

cess of foreign attachment, with some modifications, and under different names, forms a part of the municipal laws of Scotland, Holland, and most European countries in which the civil laws prevail. In Scotland, it is called arrestment. (See Bell's Commentaries on the Laws of Scotland, vol. ii.) Many remarks upon the Scotch practice of attaching property, called arrestment, will be found in the examination of Mr. William Bell, in Appendix D to the Fourth Report, the Constable's Day. The affiant of In, a process of this kind exists under the name of saisie-arrêt; the regulations respecting it will be found in the Code de Procedure Civile, partie I., livre 3, tit. 7.

The custom of foreign attachment in London differs in no material respect from that of the Scotch law; but in the years since the year 1820, 201 have been cases of attachment; and in many instances, very large sums, amounting to several thousand pounds, have been recovered in this manner. In the sher-

iff's court the cases of attachment have not been so nu-

mrous.

As this customary proceeding is of great importance to the commercial interests of the inhabitants of the metropolis, and is not generally understood, it may be worth while to give some account of it; for in the event the action, makes it, in the first instance, an affidavit of his debt, which must have been contracted within the city of London or its liberties, and should be actually due, as it is doubtful whether an attachment can be made upon a con-

tracts paper, or chattel, which is not in the hands of the goods or property of the defendant, as of the person in whose hands the goods or property is, and without it all the subsequent proceedings on the attachment would be invalid; in point of fact, however, where an attachment is intended, the officer never attempts to sum-

mon the defendant, or gives him any notice of the action, but merely makes his return to the warrant as a matter of course. After this return, a suggestion is made, or supposed to be made, by the plaintiff to the court, that some third person within the city has goods of the defendant in his posses-

sion, or in the hands of or out of his hands, and the plaintiff requires that the defendant may be attached, until he appears to answer to the action brought against him. The attachment is then effected by a notice or warrant served by the officer of the court upon the third party, who is inquired after in the general formation of the defendant, to "guard" (to warn), from whence garniture, or vulgarly, garnishes (the person warned), informing him that the goods, money, and effects of the defendant in his hands are attached to answer the plaintiff's action, and that he (the third party) must forthwith deliver up the goods, money, and effects of the defendant, to the officer of the court. After this warning, the effect of which is to secure the property in the hands of the garnishee, the process again returns, or in principle ought to return, to the de-

fendant, who must be publicly called and made default within a certain time, and the suit can be taken against his goods. In practice, however, no
process is served upon the defendant either at this or any other stage of the proceeding; nor is it ever in fact called, notice of the action or the attachment being, according to the present practice, never actually given to him. After the four days have elapsed, the plaintiff is summoned to show causes why judgment should not be given against him for the goods or debt formerly attached in his hands. He then either appears and pleads, or he moves the court to determine the attachment; money, or a debt ascertained, the judgment of the court is final in the first instance, and execution may be issued at once for the sum demanded. But where the subject of the attachment is goods, a formal sale must take place in Thames-street; the purchaser pays in which the action is pending by two freedmen, who are sworn for the purpose; and judgment is then given for the goods so appraised. It sometimes happens that the garnishers has removed the goods before appraisement; in which case the officer returns the fact to the court, and a jury is empanelled to enquire and assess the value of the goods removed; and thereupon judgment and execution follow for the sum so assessed. But before execution can in any case issue against the garnishers, the plaintiff is required to enter into a recognizance with two sureties, obliging himself to return the money or goods taken under the attachment, if the defendant appears in court within a year and a day, and dispossesses or avows the debt, or shows that it did not arise within the court.

The above is the course of proceeding in the case of a judgment by default. Instead of following this course, however, the garnishers, who is commonly the banker, factor, or agent of the defendant, usually appears and pleads. As the court, when a defendant can give security to the court from himself to the defendant, or that he possesses any goods or money of his; he may also show that he has a lien upon the defendant's goods in his own right. The question thus raised between the plaintiff and garnishers is then tried by a jury, and judgment is given upon their verdict, with or without appraisement, according to the nature of the property attached. It should be remarked that, according to the custom, the garnishers can remove his goods anywhere, even under the attachment; if the garnishers refuses to deliver them, the only remedy of the plaintiff is to arrest him.

A difference of opinion prevails amongst mercantile men with respect to the utility of this proceeding. On the one side it is said to be useful in insuring the security of creditors, to be readily able to apply the property of an absent debtor, wherever it may be found, to the payment of his creditor; and, this is contended, is particularly advantageous in cases where the garnishers would be satisfied with the payment of a debt which may have been made during their abode in England, and then remove themselves to foreign parts, beyond the reach of personal process: on the other hand, it is supposed to enourage commercial operations, in consequence of the enormities committed, and the numerous instances of exorbitant rates of interest being imposed upon the creditor, to attract property to the amount of £5,000, or any larger sum, which cannot be applied in discharge of any commercial engagements which the debtor may have formed, until the attachment be disposed of. The apprehension of this process is alleged to deter foreign merchants from concluding cargoes to London. It does not, however, appear to be likely that the existence of this custom should, under ordinary circumstances, have the effect of deterring the fair mercantile man from sending his goods to London; though it may well happen that a trader, who has contracted debts in London which he does not intend to pay, or who suspects that claims will be set up which he does not wish to afford the claimants any facilities to which they are entitled, may be a port where, by means of this process, any of his creditors there, real or pretended, might instantly seize it. Nor can much practical inconvenience arise from the power of a garnisher propery to a small debt; for the garnishers, who is in the same interest as the plaintiff, may be aggrieved in some shape or other, may at any time dissolve the attachment, by appearing for the latter, and putting in bail to the action; or, if satisfied with the truth of the debt upon which the attachment was obtained and continued, may close the garnishers's demand, and take credit for the amount in his account with the defendant: for a payment under an attachment would be perfectly an answer to any demand against the garnishers by the defendant. The alleged objections do not, therefore, appear to be so formidable as has been represented; but the advantage of a speedy and safe mode of recovering debts is obvious.

There are, however, many imperfections in this form of proceeding. In the first place, the court has no control over either side; and therefore where a small debt is contested, if the plaintiff suceeds against the garnishers, his costs may very possibly exceed the sum he can recover; and if the garnishers succeeds in showing himself not to be liable to the attachment, he may be left in the lurch without the possibility of reimbursement. Secondly, the efficiency of the custom is much impeded by the limited extent of its local jurisdiction. Thus, goods in a warehouse on the river Thames, lying in a lighter on the river Thames within a yard of the warehouse where they are exempt. So also, if a merchant keep his cash with a banker in the city, it is liable to the process; but if his banker dwell a few yards beyond the limits of the city, no attachment can be made of his balance unless the plaintiff should prepare himself with process, and be fortunate enough to serve it upon one of the partners when accidentally within the jurisdiction; in which case, as he is supposed to carry with him his books and liabilities of the house to which he belongs, the balance of any customer of the firm might be attached. But the most serious objection to the proceeding, as universally practised in London at the present day, arises from the palpable opportunity which it affords the fraudulently attached person or garnisher to attach the plaintiff and the garnisher, to the injury of the defendant. By the letter of the custom, as above stated, the defendant must be sought in the first instance by the officer of the court; and if not found in the city, and if he does not answer within seven days, or if openly called upon by the society, the doubt may arise against his goods. Still no step can be taken towards appropriating them until the defendant has been solemnly called at four several courts; and then, and not till then, the garnishers may be summoned. In ancient times, therefore, when the custom was strictly adhered to, every possible precaution was taken to give notice to the defendant of the intended proceeding against his property; and unless he was actually absent from the country (in which case he need not, or on his return to the city, of course his goods are secured to him by the society; for the custom itself would be contrary, not only to the common law, but to the first principles of justice, if it sanctioned a proceeding against a man or his property without notice. But this principle is at the present day entirely disregarded, or is considered a matter of form; and the garnisher may proceed against no property whatever to the defendant against a fraudulent collusion between the garnishers and the plaintiff. It is quite within the range of possibility that a solvent defendant may reside next door to the garnishers with whom his goods are deposited; that the garnishers and plaintiff may agree to an attachment for a real or fictitious debt; that execution may issue; and even that the year and a day may expire, and consequently the property may be absolutely lost to the defendant before he has an opportunity of taking any exception. This objection, however, applies not to the custom itself, which is in this respect just and reasonable, but to the abuse and corruption of it in modern practice.

ATTACHMENT (Process.) An attachment is a kind of criminal process which may be resorted to by any person authorized to issue summarily upon a mere suggestion, or upon the personal knowledge of the judges, without indictment or information. This process is properly granted in cases of contempt, which is considered a matter of common law, according to their discretion. Thus if a contempt be done in the presence of the court by a breach of the peace, an open defiance of its authority, or an interruption of its proceedings, the offender may at once be brought before the court, and committed to the house of correction, or to such other place as the court shall order. No other extent at the discretion of the presiding judges. On the other hand, if it be suggested by a third person upon oath that one not present in court has committed an action which amounts to a contempt, the court will make a rule
upon the offender to show cause why an attachment should not issue against him; or in flagrant and urgent cases, where an immediate remedy is necessary, will grant an attachment on the first complaint without any previous rule to show cause. In modern practices attachments are chiefly employed for the protection of vendors, and it is the primary duty of the administration of justice by judges of inferior jurisdiction, for corruption or injustice by officers and ministers of the courts in refusing to execute lawful process, for doing it oppressively, corruptly, or extortiously, or for making false or unlawful applications in these respects, which giving discred it the administration of justice, are for that reason construed to be contempt of the courts, and punishable as such by attachment. Upon such principles, attorneys, we may suppose the cases to be different from those of the former times, when witnesses, who refused to be heard, may be punished by this summary mode of proceeding for any dishonest practice, and in particular for unjust or fraudulent conduct towards their clients. It is said by Mr. Sergeant Hawkins, that barristers, 'though not officers of any court, yet insomuch as they have a special privilege to practise the law, and their misbehaviour tends to bring a disgrace upon the law itself, are punishable by attachment for any foul practice, as other ministers of justice are.' (Hawkins's Pleas of the Crown, Bk. 2, c. 39, s. 60.)

Juries also may be liable to attachment for constructive containments in their ministerial capacity: for instance, for making default when lawfully summoned; for refusing to be sworn or to give any verdict; or for receiving a bribe or influence in the return of the cause. (Hawkins's Pleas of the Crown, Bk. 2, c. 39, s. 60.) In early periods of the history of our law, juries were sometimes attached for acts done in their deliberative or judicial capacity, as for rendering verdicts against evidence or the direction of the court in matters of law. That giving a verdict contrary to the opinion of the court was not so unreasonable as it may at first appear to those acquainted only with the province of juries at the present day. In ancient times the jury were to all intents and purposes witnesses who were sworn to speak the truth (verba ducta dicere); and if they gave a false verdict upon facts, they committed a similar kind of contempt to that of witnesses committing manifest perjury at the present day. Mr. Sergeant Hawkins gives it as the inclination of his opinion that a jury would be still liable to an attachment for giving a verdict willfully against the direction of the court in point of law. The absence of an instance, however, in modern times of such a proceeding, would afford a strong argument against its legality. Besides the contempts committed by juries and persons as above noticed, there are instances which it would be endless to enumerate, in which all persons may become liable to attachment for offences of this description. Thus willful perjury in the presence of the court, refusal of oaths or oaths of perjury, judge, or judge-counterfeiting, refusal to pay money or perform acts according to the direction of an order entered into by rule of court, non-payment of costs taxed by the officer of the court in which a proceeding is pending, are all instances of such contempts, as witness and other persons who commit them to the summary process of attachment.

Attachment of Privileges was a process by which attorneys or other officers, entitled to privilege in the courts to which they belong, might, before the Uniformity of Process Act, enforce the appearance of another person in their respective courts to answer to an action. ATTACK, in military language, the effort made by armed men to despossess an enemy of any favourite positions.

ATTAINER, from the Latin word attinxit, 'attain,' 'stained,' is a consequence which the law of England has attached to the passing of sentence of death upon a criminal. Attainer does not follow upon the conviction of a capital offence: because, after conviction, the judgement of the court, or the sentence, is one which cannot be arrested, and the conviction itself cancelled, or the criminal may obtain a pardon: in either of which cases no attainer ensues. But as soon as sentence of death is passed upon a criminal who has been convicted of a capital offence, the person becomes in contemplation of law attainted, stained, or blackened in reputation. He cannot sue or be a witness in a court of justice; he loses all power of inheriting the lands and goods of any of his ancestors, or of any of the duties, or enjoying any of the privileges, of a freeman.

The person of a man attainted is, however, not absolutely at the disposal of the crown. It is so for the ends of public justice, but for no other purpose. Usual execution, his creditors have an interest in his person for securing their debts; and he himself, as long as he lives, is under the protection of the law. (See Macaulay's case, vol. xviii. of Howell's State Trials, p. 862.) For the same reasons, such a sentence disqualifies the attainer as it exists by the ordinary laws of the realm; and, secondly, gives some account of those extraordinary enactments of the legislature, commonly known by the name of Bills of Attainder.

1. The principal consequences of attainer, according to the ordinary course of law, are forfeiture of the real and personal estates, and what is technically called corruption of the blood of the offender. The forfeiture of the personal estates is an ever-present calamity, from which the offender only recovers to the goods and chattels of which he was actually possessed at that time. Real estate is not forfeited until attainer; but then the forfeiture (except in the case of attainer upon outlawry) has relation to the time when the offence was committed, so as to avoid all intermediate sales and incumbrances. (Co. Litt. 390 b.)

The extent and nature of the forfeiture of real estate upon attainer differ in the case of high treason, and in cases of murder or other felony. Attainer for high treason is followed by an immediate and absolute forfeiture to the crown of all freehold estates, whether of inheritance or otherwise, of which the person attainted was seized at the time of the treason committed. This consequence of attainer for high treason is derived from the statutes of the Anglo-French jurisprudence. (Com. vol. ii. p. 251; iv. p. 304.) Copyholds are like manner forfeited to the lord of the manor of which they are held, upon the attainer of the tenant for its default.

By stat. 5 & Edw. VII., cap. 11, the dower of the widow of a person attainted for high treason is also forfeited. But it is to be remembered that there is no forfeiture unless an actual attainer takes place; and therefore if a traitor dies by his own hand before judgment, his lands are not forfeited, unless a special act of parliament is passed for the purpose. It is said, however (Reports, iv. 579), that if the chief justice of England in person, upon the view of the body of one killed in open rebellion, records the facts and returns them into the court of King's Bench, both the lands and the goods of the rebel shall be forfeited.

This absolute and entire forfeiture of the estates of persons convicted of high treason was often productive of extreme hardships and injustice. Many of those who were no parties to their crimes, participated in their punishment. In certain modern treasons, therefore, relating to the coin, created by statute, it is expressly provided, that no person be punished save that to the person, or the life of the offender, and that they shall not deprive his widow of her dower. (Stat. 3 Eliz. c. 11; 16 Eliz. c. 1; 5 Will. III. c. 26; 15 & 16 Geo. II. c. 28.)

In cases of attainer for murder or other felony, the forfeiture of the blood is to the crown a punishment for a longer term than a year and a day, with an unlimited power of committing waste upon the lands during that period. This is called in our old law-books 'The King's year and a day's waste.' After the expiration of this term, the lands would naturally descend to the heir of the person attainted, if the feudal law of seisin for corruption of blood did not intervene, and vest them in the lord of whom they are held. In order to understand the doctrine of seisin for corruption of blood, we must remember, that in our modern law of real property is chiefly derived, all lands were, or were supposed to be, held by gift from a superior lord, subject to certain services and conditions upon which any grantee in fee simply possessed the lands, and the life of the grantee is seised, i.e. fell back to the original giver. Now, by the attainer of a tenant in fee-simple for felony, the compact between him and his lord was totally dissolved; his blood was suspected to be corrupted, and he was disabled not only from inheriting the lands himself, but passing them down to his descendants. Even though he had no lands in possession at the time of the attainer, and acquired none afterwards upon which the law of forfeiture could operate, his title to the lands would be destroyed, and the title pass to the justiciary of the descendants. For even as to the seisin of his blood, which completely stopped up the course of descent, it was impossible to derive a title to any lands, either from
him directly, or from a remote ancestor through him. The inevitable consequence was an attack on any one who was in the house of the king as a feudal superior, for he was generally the sole party interested in the estates of the deceased person. On this ground the law took the form of a provision to confound forfeitures into one, unless we illustrate the difference between them by some familiar instance of their respective operations according to the law as it formerly stood. Thus (to take the instance of a case held by his late grandfather, Commonmolton's case, p. 231), if a father were seized in seisin, and his son committed treason and were attainted, upon the death of the father the lands seized to the lord, because the son by the corruption of his blood was incapable of being heir, though the mother might be so, though he might have been in feoff or fee demesne, for the king, for the son never had any interest in the lands to forfeit.

The practical injustice and hardship caused by the doctrine of the corruption of blood in punishing the offences of the guilty by a heavy punishment upon the innocent, have frequently attracted the attention of the legislature; though, until lately, little has been done towards permanently remedying the evil. Thus it has been usual, where a new felony has been created, Act of Parliament, to make an express provision that it should not extend to corruption of blood. By the stat. 7 Anne, cap. 31 (the operation of which was deferred by 17 Geo. II. cap. 39), it was enacted that after the death of the Pretender and his sons, no attaint for treason committed under the Pretender should attach to any person other than the offender. But both these statutes being repealed by 39 Geo. III. cap. 93, the ancient law of forfeiture for treason was restored. By the stat. 3 Geo. III. cap. 145, corruption of blood was taken away for the future in cases of treason, petit treason (i.e. where a wife had murdered her husband, a servant his master, or an ecclesiastic his superior), and other murders. Finally, the worst consequence of the doctrine of corruption of blood, the imposition of a new treason traversed through attainted persons, was removed by the late statute of the 3 & 4 Will. IV. cap. 106, sec. 16, which enacted, that no attaint for the future should prevent descent (which, by the first section of the act, means, title to inherit by coming to title from being traced through the body of an attainted person, unless the lands seceded before the 1st of January, 1834).

A dignity descended to the heirs general is forfeited to the crown both for treason and for felony. An entail does not forfeit for treason but for felony. Thus Lawrence, Earl Ferrers, whose seignory was limited to the heirs male of the body of his ancestor, being attainted for murder in the reign of George II., was succeeded by Washington, next brother. (Cruise, Real Property, lib. iv. sec. 64, 72, 73.)

The corruption of blood produced by an attainted cannot be effectually removed except by authority of parliament. The king, says Blackstone (vol. ii. p. 254), may excise the most inestimable estate at his pleasure, may execute, in fact, a new forfeiture, in which the interest of the crown is alone concerned; but he cannot wipe away the corruption of blood; for therein a third person hath an interest, the lord, who claims by seisin. But it appears from the same author (vol. iv. p. 492), that the law is so far effectually after an attainted, that it imparts new inheritable blood to the person attainted, so that his children born after the person may inherit from him.

The mistake of an attainted by the common law, as above described, there have been frequent instances in the history of England, of attainers, by express legislative enactment, called bills of attainder. This has happened, either from the extraordinary nature of the crime, or from confounding the case of illegitimacy of the child of the convict with the impossibility of the child's being attainted. It has been thought necessary to have recourse to the supreme power of the legislature, for the purpose of punishing particular offences. These enactments, either in the shape of bills of attainder or bills of pains and penalties, have been very frequent. In the time of the late war, it has been thought of great importance to have recourse to the supreme power of the legislature, for the purpose of suspending the ordinary law. There were some instances of them under the Plantagenets, as the bills of attainer against Roger Mortimer, and Edmund earl of Arundel, in the reign of Edward III. Both of these, however, were reversed in the same reign. It was not till the reign of Henry VIII., which was fertile in new crimes and extraordinary punishments, that the use of the power was carried to an extreme, and led to supersede trials according to the ordinary process of law. Scarcely a year passed without persons of the highest rank and most distinguished character being brought to the bar of justice by bills of attainder. Such, for instance, were the celebrated earl of Surrey, Cromwell earl of Essex, who was said to have been the adviser of those measures, and most of those persons who suffered for denying the king's supremacy. All of these were attainted upon mere hearsay evidence; and the same fate awaited those who ventured without being heard in their defence. In the following reign of Edward VI., the Protector Somerset encouraged a bill of attainder for treason against his brother Lord Seymour of Sudeley, the lord high admiral of England and husband of the queen dowager Catharine Parr, who was hurried through both houses of parliament, without the accused being permitted to say anything in his defence. But, as the nation became better acquainted with the principles of constitutional government, the practice of such bills of attainder became less frequent. Under the Stuarts resource was seldom had to this extraordinary mode of proceeding. It was thought necessary to adopt it in the time of James I., with respect to Catesby, Percy, and several other persons, who had been involved in the Gunpowder Plot, or died before they could be brought to trial, as they, not having been tried, could not have been attainted by the ordinary process of law. A remarkable instance of the.practice of bills of attainder occurred after the restoration of Charles II., and all the records of the proceedings cancelled by act of parliament. The duke of Monmouth also, on his appearing openly in arms against the government, in 1685, was attainted by statute. A remarkable instance of a proceeding by bill of attainder occurred in the case of Sir John Fenwick, who, in the year 1696, was attainted for a conspiracy to assassinate William III. There is no question that Sir John Fenwick might have been tried by the ordinary process of law. The excuse urged for resorting to a bill of attainder, that there was no moral defect of Fenwick's guilt; but that as two witnesses were required by the stat. 7 Will. III. cap. 3, in order to convict him; and as one of them had been tampered with, and removed out of the kingdom, a legal proof of an overt act of treason became impossible. The effect of this bill of attainder was therefore to suspend the statute of 7 Will. III. cap. 3, before it had been two years in operation, in order to destroy an individual. This is a remarkable example of an extraordinary legislative act, without a strong opposition, and has been frequently repeated in subsequent times. Bishop Burnet, one of its most strenuous supporters, allowed that 'the extreme way of proceeding was to be put in practice but seldom, and upon great occasions.' (Howe's State Trials, vol. xii.)

The legislature, acting in conformity with this sentiment, have seldom, since the accession of the House of Hanover, had recourse either to Bills of Attainder, or Bills of Pains and Penalties. Penalties by the instance of a crime occurred during the Irish Rebellion, in 1798, in the case of Lord Edward Fitzgerald, who was being arrested on a charge of high treason, and dying in prison, before he could be brought to trial, of the wounds which he had received in the course of his arrest. Lord Edward was an attaché of the Irish Parliament. But when the violence of party spirit had subsided, the old principle of the constitution, that every man shall be considered innocent of a crime until his guilt has been legally proved, prevailed, and it was given as a sufficient reason to apprehend that a practice so obviously unjust, and so dangerous to the fundamental principles of good government, will be adopted in future.

ATTAIN (attainct), an old word, which formerly lay to import whether a jury had, or had not, given a false verdict. It at first lay only on the trial of writs of assize, and is said to have been introduced by Henry II. At the instance of Chief
Justice Glanville, as a check on the vast power then vested in the recognition of assizes of finding a verdict according to their own personal knowledge, without an examination or views. It was afterwards extended by Edward I. to all pleas of land or freehold, and by statutes in the reigns of Edward I. and Edward III. to all pleas whatsoever, whether real or personal, except writs of right, where the issue was joined on the mere right. The jury on the attainder were twenty-four in number, and must be possessed of freehold of the annual value of 20l., if the matter in dispute was of 40s. value in personas, or of 40s. a year value in lands. At common law, if the grand jury found that the verdict was false, the judgment against the jury finding was one of extreme severity; namely, to lose their liberum legem, and be infamous, to forfeit their goods and profits of their lands, to be imprisoned, and their wives and children to be thrown out of doors; their houses to be razed, their trees extirpated, and their meadows ploughed, and the plaintiff to be restored to all he had lost by reason of the unjust verdict. But a much more moderate judgment was afterwards introduced by 11 Henry VII. c. 24, made perpetual by 13 Eliz. c. 28.

This clumsy expedient for controlling the extensive power of a jury was found to consist of terrors which could only with great difficulty, and in rare cases, be carried into operation. The jury could only be attainted either for finding a verdict contrary to the evidence, or for finding one on evidence not sustaining the issue. But it was almost impossible to attain them on the former ground, since they were at liberty to take their own personal knowledge for evidence; as to the last, the judge had some control over the giving them directions as to the precise point to the issue to which the evidence was to be applied, and if they found a verdict contrary to the express direction of the judge, they ran great risk of an attainder. So inconvenient and ineffectual, however, was the proceeding, that it gave place in the time of Elizabeth and James I., to the now existing practice of setting aside verdicts on motion and granting new trials; and very few instances of an attainder appear in the books later than the sixteenth century. By the Geo. IV. c. 50 (consolidating the laws relating to injuries), the proceeding was totally abolished; but it is provided, by sec. 61, that no person guilty of embezzlement (corruptly influencing a juror by promises or money) may be proceeded against, and punished as before. [See Embezzlement.]

**Attalea**. A genus of palms, found chiefly in the tropical parts of America, where it occupies the richest soil and the hottest forests, rarely ascending the sides of mountains, or spreading from the woods into the open country. It extends from Yucatan in Mexico, to the southern part of the Cape of Good Hope. It belongs to the same division of the natural order as the coco-nut, from which, as well as all its immediate allies, except Arenga (which see), it is distinguished by not containing three cells and three seeds. It is described by the great Linnaeus as a family consisting of lofty or middle-sized, or even occasionally stemless species, with a thickish trunk, the wood of which is soft and of a reddish-brown colour; it is irregularly marked externally with scars, and is terminated by large pinnate leaves, the stalks of which are broad, and the segments smooth, rather thick, plaited, and notlooking. The bunches of fruit are simply branched, but are often of a vast size, and hang down from the bosoms of the leaves, covered with brownish nuts, the seeds of which are edible. Several species are known, of which the two remarkable are the following.

**Attalea funifera**, called by the natives macaba, is found in the native forests of the maritime provinces of Brazil, where it is one of the most valuable trees, which the bountiful hand of nature has conferred on man. The best copaeeia, in America, for naval purposes, is manufactured from the fibres of the leaf stalks and other parts; such ropes are of great strength, and are extremely durable in salt water; many other cables are employed in a great part of the Brazilian navy. This species does not grow more than twenty to thirty feet high; its nuts, which are about as large as an ostrich's egg, have a hard shell like that of the coco-nut.

**Attalea cohune**, another species, is equally useful, but for different purposes. This plant, the pandero of the old writers on Brazil, and the *maçã* of the modern Portuguese, forms delightful groves in the interior of the country, growing from twenty to fifty feet clear of its branch-like leaves. The latter are from fifteen to twenty feet long, and about three feet wide. The fruit is the size of a goose's egg, and contains an edible kernel, of which the negroes are fond. Its leaves form an excellent thatch, and are woven into hats, mats, and baskets.
tax on all vessels entering the Euxine (about 291 B.C.), Attalus readily espoused the cause of the Byzantines, though he could be of no essential service, as he had been defeated a little before by Achaeus, and confined within the limits of Pergamus. He still, however, continued the war with Achaeus; and hisrag in which the body of the Gaul was discovered, he recovered many of the cities of Eolia, which had submitted to Achaeus. In the midst of his victorious career, an eclipse of the moon (B.C. 216) happened, which so alarmed the superstitious Gauls that they refused to continue the war, and returned in perfect security. He left Spain and returned with his army to Pergamus. (Polyb. v. 77, 78.)

We find him in alliance (B.C. 216) with Antiochus the Great, king of Byzas, who was equally anxious with himself to get rid of Achaeus (v. 107). Several years afterwards, when the Rhodians came to terms with Antiochus and the Macedonians, he joined with the Aetolians, the weaker party, against Philip, king of Macedonia. The king of Pergamus was invited to join the alliance (B.C. 211); but we do not find that he took any active part till some time afterwards (B.C. 208), when he was appointed joint protector of the Aetolians with their general Pyrrhus. He sent some auxiliaries, and towards the end of autumn made his appearance at Sikinus with his fleet. Here he passed the winter; but as soon as the season allowed, he embarked on the sea. He then took the city Opsa, the capital of the Locris Opuntii, with the consent of the Romans, allowed it to be sacked by his soldiers. While he was employed here in collecting tribute from the surrounding chiefs, he narrowly escaped being taken prisoner by a party who suspected him of his own accord, and cut off a considerable number of his men. At Atrax, king of Bythynia, had passed the frontiers of his kingdom, he left the Rhodians without resources, and was compelled by the Rhodians (Liv. xxvii. 30, 32; xxviii. 7.) Peace was soon afterwards concluded between the Aetolians and Philip, which was also acceded to by Attalus. When the Romans were ordered (B.C. 205), by an oracle from Delphi, to deliver up to the Macedonians the body of Philip, who was consigned to their care by his own consent, it was to the king of Pergamus that an embassy was sent, and through his means the black stone representing the goddess was procured and conveyed to Rome (xxxi. 11, 12). Peace, however, did not continue; for we find the Rhodians engaged with Attalus (B.C. 201), against Philip, in the second battle of Chama. Attalus behaved with great bravery on this occasion; but having pursued a Macedonian vessel too far, he was forced to abandon his ship and escape by land. This gave Philip a pretext to claim the victory, though his loss was a heavy one.

The next year (B.C. 201), having been deposed by Pergamus, Attalus returned to his city, and went up to Athens (B.C. 200), where he received with great honour, and was abundantly supplied with money. He joined the Romans with a considerable body of troops; and the confederates laid siege to Oremus, a strong city of Euboea, which they took after obstinate resistance. While Attalus was thus engaged at a distance from his kingdom, Attalus with the assistance of Philip, engaged in the midst of an elongated barangus, which he was pronouncing with great force, he was seized with apoplexy; and though he lingered long enough to enable him to be conveyed to Pergamus, he died with his works, in the seventy-first year of his age, having reigned forty-four years. (Scip. 5; Liv. xxi. 21.) He left, by his wife Apollonia, four sons, Eumenes, who succeeded him; Attalus, who succeeded his brother Eumenes; Philuterus; and Athenæus.

A few years of his reign were imbittered from his affection to his brother, who was born B.C. 220: he was the second son of Attalus L. and succeeded to the throne of Pergamus on the death of his brother Eumenes (B.C. 159), as the son of that prince, also called Attalus, was of too tender an age to oppose the claims of his uncle, who was already the acknowledged chief of the kingdom of Cappadocia, in which he seems to have been successful. (Polyb. xxxii. 22.) He pursued faithfully the policy of his family, in maintaining an intimate alliance with the Romans; and he was treated by them with that friendship which the Romans had for Attalus, the king of Bythynia, made an attack on the territory of Attalus (B.C. 160), and even laid siege to Pergamus itself; but, frightened by the threats of the Romans, he was compelled to desist, and to indemnify Attalus for the loss he had sustained. This war, however, was carried on for several years; the leading facts may be found in Appian's Mithridat. v. 37; also Polyb. xxxii. 26; Liv. xi. 8, 10, 11. Five years afterwards (B.C. 149) we find Attalus assisting Nicomedes against his father Prasias (Strab. xiii. 634); but though he lived to the advanced age of eighty-two years, we are unable to mention any circumstances connected with him. He lived in perfect peace and quiet until he was so much under the influence of his minister Philopomen, that the Romans used in jest to inquire from those returning from Asia whether Attalus was still the chief favourite of Philopomen. (Plutarch, Mor. p. 792.) He was the father of six sons, of whom the eldest was named after the city of Lydia (Steph. Byz.); and of Attaleias in Pamphylia (Strab. xiv. 667); and it was probably this king who was so fond of collecting works of art, that he gave one hundred Attic talents for a painting of a sick man by Apelles, to mean the contemporary and rival of Apelles. (Plin. viii. 36, xxxv. 9.) He was also the inventor of a kind of embroidered hanging or tapestry (viii. 46.).

ATTALUS III., named Philomelos, from his affection towards his mother on the death of his uncle, Attalus II.; but he is little known to us, except for the madness and extravagance of his conduct. He reigned was chiefly memorable for the murder of his friends and companions with whom he was always infatuated; and for himself every sort of negligence which the most graceful superstition could invent. He finally gave up all care of public business, and devoted his time to gardening, which he carried on with great expense and industry, and to a work on the subject, which is recommended by Pliny (xxvii. 4.), Varro (R. R. lib. i. 1), and Columella (R. R. lib. i. 1.) Having engaged with great eagerness in the erection of a sepulchral monument to his mother Stratonice, daughter of Seleucus, king of Syria, he was induced by a Greek bishop to refrain from the violation of the sun's rays; and having been seized by a fever, he died, after a reign of five years, B.C. 133, leaving in his will the expression "honorum meorum Populos Romanos harena esto," thereby making the Romans the heir of his movable property; but which they carefully preserved, and called the kingdom of Pergamus. (Justin. xxxvi. 4.; Diodor. Sic. xxxiv., vol. x. p. 128, ed. Bib.; Plin. xxxii. 11.) The kingdom was claimed by Aristonicus, an illegitimate son of Eumenes II., and he bravely maintained the contest for a long time; but at last, when he was conquered by Attalus, he was carried to Rome, and strangled in prison, B.C. 129. The kingdom of Pergamus was from this time the Roman province of Asia. (See Clinton's Rusti Heleniæ, vol. i.)

The kingdom of Pergamus was held by the descendants of Honorius, was sent by the Romans to that emperor at Ravenna, to represent to him the difficult situation of the capital, threatened at that time by Alaric, and to advise him to fulfil the conditions of a treaty which had been concluded with Gothar chief; but the weak and false Honorius refused to listen to the proposals, thinking himself possessed already of the real power, and in no need of Honorius's consent. Attalus, however, having opposed Alaric, was proclaimed by the king of the Suebi chief as a presumptuous, incapable person. After this, Alaric again besieged Rome, took it, and gave it up to pillage in August, 410. Upon Alaric's death, Attalus followed the fortunes of his successor, Ataulphus, whom he accompanied in his expeditions to Sicily. In the year 418, Ataulphus and his brother Placidia, the sister of Honorius, in the town of Narbo, Ataulphus sang an epithalamium which he had composed for the occasion. Ataulphus seeing Honorius persisting in his hostility to him, was proclaimed by his soldiers emperor once more, and restored his restored dignity was merely that of a vassal; Ataulphus's death, his successor, Vallia, having concluded peace
with Honorious, Attalus endeavored to escape the emperor's vengeance, but was taken at sea, and, by Honorious's order, confi ned in the island of Lipari, after having had the fingers of his right hand cut off, in order to prevent him from being able to write. Attalus was afterwards recalled to Rome, where he died in obscurity. (Zosimus, Orosius, and Gibbon.)

ATTAR, or OTTO OF ROSES, an essential oil obtained in India from the petals of the rose centifolia and sesquipedialis; for this purpose a cake or gelatinous substance is filled with the rose leaves carefully separated from the calyxes, and spring water poured in just sufficient to cover them; the vessel with its contents is then set in the sun for two or three days, and taken under cover during the night. At the end of the third or fourth day, yellow articles of rose oil are seen floating on the surface of the water, which in the course of a week will have increased to a thin scum; this is taken up by a little cotton tied to the end of a stick, and squeezed into a small vial. (Aikin's Dictionary.)

This oil is a well-known perfume; but the odor is agreeable only when diffused, being too powerful when it is concentrated. According to Saussure, the attar is a mixture of two oils, one of which is solid, and the other fluid, at the usual temperature of the air, the latter being separated by washing with alcohol, which does not dissolve the concrete oil at a low temperature; or by pressure between folds of paper, which absorbs the fluid oil. By the latter process, three parts of the common yield one part of the concrete oil.

Attar of roses liquefies at about 85° of Fahrenheit, and the solid oil at about 91°; the latter crystallizes by cold into brilliant white transparent laminae of the consistence of bees' wax. The density of attar of roses rendered fluid at about 14° is 0.866, and the solid oil at about 14°, 0.932, which, according to M. Saussure, is less than that of any other essential oil that he examined; the concrete oil, when fused, is even lighter than this.

The concrete oil is very slightly soluble in alcohol, 1000 parts of the density of 0.806, taking up only two parts of it at 37° Fahrenheit, while the same quantity of alcohol dissolves seven parts of the attar, and the fluid portion is still more soluble.

Saussure observes that the most remarkable circumstance attendant upon this analysis, is its close resemblance to that observed in <carbon tetrachloride>, which is, carbon tetrachloride (86.763), hydrogen chloride 14.29. Indeed these bodies may be considered as what are now termed isomeric compounds.

ATTUR, FRANCIS, bishop of Rochester in the reigns of Queen Anne and George I., was born on the 5th of March, 1662, at Milton, near Newport Pagnell, in Buckinghamshire, of which parish his father was rector. He was educated at Westminster, and elected student of Christ Church, Oxford, in 1680. According to Wood, he took the degree of bachelor of arts in 1684, and that of master in 1687. In 1696, he was the first writer in an answer to Considerations on the Spirit of Martin Luther, and the Original of the Reformation; a tract published under the name of Abraham Woodhead, an error which was corrected in the second edition, by Francis Walker, master of University College. Bishop Burnet, in his History of his Own Times, ranks this vindication amongst the most able defences of the Protestant religion. Atturley himself, on his trial, appeared to this book to exculpate himself from the censure of a secret libel on a doctor of divinity, and on this disapprobation he sought for popularity and promotion in the more striking theatre of the metropolis. Here his talents for the pulpit soon became conspicuous: he was speedily appointed one of the royal chaplains in ordinary, and was elected preacher of Bridewell, and lecturer of St. Bride's. To his sermon on the Power of Charity to cover Sin, Handly published Exceptions, which Atturley did not, and perhaps could not, answer. Another sermon, entitled The Scourer of Wit, or the Blind Prophet, published by John Gravelock, in account of a supposed inscription against Archbishop Tillotson's orthodoxy. In the year 1708 appeared Mr. Boyle's Exposition of Dr. Bentley's Dissertations on the Epistles of Philemon and Phidias of Asop. Though this work was published under Boyle's name, it was shewn by Bishop Monk (Life of Bentley) that Atturley had the chief share in the undertaking, and in fact wrote more than half the book. Whatever credit we may give Atturley for ingenuity and humour, this work proves that he had not much learning.

In the year 1715, Atturley appears to have entered into controversy with Dr. Wake, afterwards archbishop of Canterbury, and others, concerning the rights, powers, and privileges of convocation. Dr. Wake alleged the authority of Christian princes over their ecclesiastical synods, with which Atturley defended his position in a long and learned essay. Atturley took the opposite side of the question, in a rough and acrimonious spirit, but with much ingenuity. Stockhouse, in his Memoirs, says, that Dr. Atturley, in his controversial writings, dealt out his wit and satire at such a rate as could not be served by any one else. However that may be, his zeal for the interests of his order procured him the thanks of the Lower House of Convocation, and the degree of Doctor in Divinity, without exercise or fees, from the University of Oxford, for the defence of Queen Anne. In 1702, Atturley was appointed one of her chaplains in ordinary, and in 1704 advanced to the deanship of Carlisle. His characteristic impatience broke out remarkably on this occasion. He took out his instruments before his predecessor had resigned. Dr. Nicholl, in a letter of the Historical Library, to bishop of Carlisle, and owing to a previous misunderstanding, fully detailed by Stockhouse, was not kindly disposed towards the new dean, and required the preceding dean's resignation to be produced. When the gray hair of Atturley's predecessor was to be dated a month subsequent to Atturley's collation, which was therefore void. Atturley attempted, but without success, to procure from his predecessor, and afterwards from an officer in Chancery, a clandestine alteration of dates. As the prebend was only ten years in the deanery, the motive (beyond a desire to save trouble or expense) can be assigned for this extraordinary proceeding; but it indicated a lax adherence to veracity, and was a scandalous contempt of public decency. He was at length admitted to his deanship without this matter of date being passed over.

In 1706 Atturley was engaged in a dispute with Hoadly concerning the advantages of virtue with regard to the present life. In a funeral sermon he had asserted, that if the benefits resulting from Christianity were confined to the present life alone, it was a miserable race, the most miserable. Hoadly, on the contrary, maintained, in a printed letter to Atturley, that it was a point of the utmost importance to the Gospel itself, to vindicate the tendency of virtue to the temporal happiness of man. Atturley defended his position in a long and learned essay in the second edition of his sermon; to which Hoadly published a rejoinder. In 1707 Atturley was made canon in the cathedral of Exeter; and in 1709 his eloquence raised him to the prebendarry of the Rolls Chapel. In the same year he was the first member of any college in the metropolis to be made dean, and Hoadly, concerning pious obedience. In 1710 Dr. Sarceverell's trial took place; and it is stated in Boyer's History of the Life and Reign of Queen Anne, that the defence was generally thought to have been much the best; but Dr. Atturley, in conjunction with Dr. Smaltridge and Dr. Furness. In the same year Dr. Atturley was chosen proctor to the lower house of convocation. In 1711 he was chiefly concerned in drawing up a representation of the present state of religion, with Bishop Burnet, and other divines, for the purpose of convicting the administration of the Revolution. His draught was agreed to by the lower house; but the bishops ordered another to be drawn in more moderate terms. The more violent representation was not presented to the queen; but was put in his pocket. In 1712 Atturley was made dean of Christ Church, Oxford. Owing to his imperious temper, the flames of discord were blown out in the College, and his removal was thought necessary for the restoration of peace.
compelled to carry water after him, to extinguish the flames of his litigiousness. In 1713, on Lord Oxford’s recommend-
ation, he was promoted to the bishopric of Rochester, and the deanery of St. Paul’s also became vacant. In the same year, Stackhouse quizzically observes, that the eyes of his understanding were blinded, by Lambeth being opposite to Westminster. It has been generally thought that he aspired to the primacy, and that he probably would have been elevated to the see of Canterbury during the reign of William and Mary, had he not been removed in 1725 to a bishopric in Scotland. He died in Edinburgh, in 1731, at the age of sixty-four. His death was mourned by a large concourse of people, and the cause of religion suffered by his absence from the see.
but once the chief town of the district, was formerly a favourite resort of its then owners, the prince-bishops of Bamberg. The lake is about 12 miles in length from north to south; its surface contains 8121 Vienna yachts, or 11,547 English acres; and its south-western extremity is about 21 miles distant from Salzburg. S. Hall places it in 47° 55' N. lat., and 13° 35' E. long. The Ager flows northwards out of it into the Traun.

ATTIC: a term in architecture, comprehending the whole of a plain or decorated parapet wall, terminating the upper part of the façade of an edifice. The derivation of the word is uncertain. It appears to have been a generally received opinion that the word was derived from the circumstance of edifices in Attica being built after this manner. There is at Athens a monument, that of Thrasyllus, with an attic over the order of pilasters which form the basement. In the centre there was a colossal statue. [See Athens, p. 10.]

In a note to the second edition of Stuart’s Athens, published in 1825, the editor is of opinion that this attic was not contemplated in the original design, but added at the date of the two upper inscriptions when Thrasyllus was Agonothetes. (See note, p. 92, vol. ii., second edition of Stuart, 1825.) This example, however, may be taken as the best type of a Greek attic which is at present known. In the Archologia Londinensis there is an ingenious, although, as we think, a wrong derivation of the word attic, unless we suppose the word compounded of a privative, and τάξις a wall, thus signifying ‘without a wall, or without being in connexion with a wall’.

The example of such an attic, it is said, is found in all Hypothalae temples, for as the naos, nave or space between the inner ranges of the columns, must not be covered, upper ranges of columns, with a wall above them, must be placed over the lower order of columns to catch the end of the rafters at its highest elevation: an example of this kind of attic may be found at Paeumia, in Italy.

Another example, which bears a closer resemblance to the Roman attic, exists in the upper wall of the nave of the Temple of Jupiter Olympius at Agrigentum (see Atlantis), where there is an entire wall with short pilasters at intervals, in the front of which are figures placed above the pilasters of the nave. Vitruvius and Pliny do not make any mention of, or allusion to, the attic of a building as we understand it at the present day. In the annexed cut we have given a representation of a Roman attic, the only remaining part of a superbly decorated wall enclosing the Forum of Nerva at Rome. This wall was of considerable extent, and was divided at intervals by columns projecting from the wall, over which, as may be seen in the drawing, the attic wall is continued at right angles to the wall forming the enclosure. The attic, also, is a very conspicuous feature in the triumphal arches at Rome and a necessary one: it was not merely intended as a framework for the inscription, nor as a support for statues, but is essential to the proportions of the whole composition.

In all the best examples, and especially in the remains of antiquity at Rome, the attic is decorated with a moulded base and cornice, often with pilasters and figures, as in the arch of Constantine. At Thessalonica, in the Jews’ quarter, are the remains of a building called the Incantada, drawn and described by Stuart in the 3rd vol. of his Athens. Five Corinthian columns on their pedestals support an entablature; over four of these columns there still exists an attic adorned on each side with figures in alto relievo. The spaces between the figures are open, and there is a cornice over the figures with a base at their feet; the design and execution of this work are attributed to the period of Roman dominion.

Rather than to any other. (Stuart’s Athens, vol. iii.) At Bourdeaux, a somewhat similar building existed in the reign of Louis XIV., which was destroyed by Vauban to erect the fortifications constructed at that time. Perrault, the architect, made a drawing of the ruin previous to its destruction; from which circumstance the design is now preserved, and may be seen in the Antiquités of Stuart’s Athens (1825). The most remarkable difference between this building and the Incantada is, that in the former, the openings in the attic between the figures are arched, while in the latter they are bounded by the straight line of the cornice. The arch in the former is contestably to have been a Roman work; while from the
uncertainty respecting the date and use of the building at Thessalonica, the period of its erection cannot be ascertained.

The Italian architects who had studied the remains of antiquity in Rome, and those who followed in their school, usually employed an attic in their designs, as may be seen by a reference to their works, and more especially to the description given by Vitruvius. (De Architect., v. 5.) The name of Andreau Palladio raccolti ed illustrate, da Ottavio Bertotti Scamozzi, 1776. The attic is in such common use, that there are few public buildings in London without it. Somerset House, in the view towards the street, may be taken out. One takes, as usual, in architecture, the description under the name of Attica.

In Attica, or at the ornamental tops of a house, with or without a parapet-wall in front. It is possible that the parapet-wall which corresponds with the attic-wall in architecture, may have given the name to the rooms or roods in the upper stories or roofs of houses.

Attica (properly Attiké, Attika), one of the political divisions of ancient Greece. The origin of the name is doubtful; some (Strabo, p. 391) have derived it from the word Acte, a term expressive of the form of the coast line. [See Actium.] From Acte the word Actike might be easily derived. But it is perhaps more likely that Attike contains the element Ath or Ath, which we observe in the words Athias and Athenas.

It has the form of a triangle, two sides of which are washed by the sea, and the third is protected by mountains. The mountain-range which descends from northern Greece forms a knot close upon the Corinthian gulf, at the base of the mountain, which forms the isthmus between the N.E. and the Corinth gulf (here called the Alcyonian), and the Saronic gulf; its termination on the shore of the Saronic is marked by the delta of the river Saron, which, after crossing the isthmus, runs northward as far as the ancient Brauron, which is near the eastern coast, and probably on the Erainus. The whole of this barren district was called by the general term of Paralia, or the Sea Coast District. The small extent of level or unirrigated country bounded by Pentelias on the north, Hymettus on the west, the hills of the Paralia on the south, and the sea on the east, was named Mesogia or the Central Plain, a name which is applied to the central plain of Greece, on account of its being the natural road from the Athenian plain into the Mesogia runs in the depression between the two parts of Hymettus; another road from the upper valley of the Cephisus leads into the Mesogia between the heights of Pentelicus and the southern parts of Hymettus. The Mesogia, therefore, supplies the N.E. angle of the province, between the southern extremity of Pentelicus, the range of Paralia, and the sea, was called Diocria, a name which implies a region interspersed with rugged eminences. The only level part of this district is the small plain of Marathon which opens to the sea.

It appears, then, that Attica Proper, with respect to its plains, is distributed into four natural divisions:—1. The Eleusinian or Thessalian Plain; 2. The Athenian Plain; 3. The Mesogia; 4. The Plain of Marathon. The area of Attica may be thus divided:—a. The land within the walls of Athens is about 27 square miles, not including Salamis, which perhaps contains about forty square miles. Though we now know the coast line of Attica with accuracy, we are still without that exact knowledge of the whole, which it is the object of the geographer to avoid considerable error in estimating the surface; but taking it at 700 square miles, it is nearly equal to that of Worcestershire (718 square miles), and only about one-eighth of that of Yorkshire.

The plain of Marathon or Oropia, lying between Parnes, the Asopus, and the sea, contained the town of Oropus; though physically separated from the rest of Attica, and properly considered a part of Boetia, this district generally belonged to the Athenians. To settle all disputes, Philip gave it to the Athenians. (Polyb., 3. 34. 11.)

The sea-coast of Attica begins on the west side with the fine bay of Evia, formed by the receding coast of the main land and the irregularly-shaped island of Salamis, which lies in front of it. Two narrow channels, one on the
The ancient names on the map of Attica are in brackets.

Proceeding along the coast we come to the ports of Athens, already described (see Athens), to the promontory Colusa, on the east side of the Phaleric bay; and to a low marshy shore, or lagoon, occupying a large part of the coast between Colusa and the Cape of Hiera, now Cape Pavlo. Between Hiera and Zoster, which forms the most remarkable projection on this coast, and some small rocky islands (Leuke), which the Persian ships, when flying from the battle of Salamis, at first sight mistook for the enemy's fleet; but Herodotus (vii. 97, 107) says, though he probably might be mistaken, that the height which appeared like ships were on the mainland. The position of Cape Astypalae seems to be indicated by the island of Eleusia (now Lagonissi), which lies in front of it. The extreme point of Athens, Cape Sounium, is now called Colonus, from the fourteen remaining Drew columns of white marble, which adorned the temple of Athens of Sounium, the tutelary goddess of the land. Sunium was made a strong fort (Thucyd. vi. 4), and the walls are still traceable in all their circuit except in some parts, which, owing to the precipitous character of the rock, needed no defence. The circuit of the enclosure is above half a mile; the temple occupied a small part of it close upon the bold promontory, and appears to have had

[The ancient names on the map of Attica are in brackets.]
that there was a road along the coast from Rhannus to Oropus; this road must have passed Paphis, which Col. Leake would place at Calamo. The coast line from Sunium to Calamis is quite smooth or quit straight, which is the same length that we have assigned to the western coast; it happens, also, that the direct distances from Sunium to the Horns and Calamis respectively are very nearly the same.

We shall now make a few remarks on the two great plains of Attica, the western plain of Attica, and the eastern plains of Attica. We have preferred the name of Eleusinian for the western plain of Attica, though the chief part of it is called the Thrian by ancient writers, from the demes of Thria. The range of Ægeaeus formed a natural limit between the Attican plain and that of Thria; and the obscure traces of old traditions, the Eleusinians, in the earliest history of Attica, were a community quite distinct from the Athenians, and sometimes at war with them. The fertile Thrian plain extended between the range of Ægeaeus and Eleusis along the borders of the bay, and to the north of it. The Sacred road from Athens to Eleusis, after crossing Ægeaeus by the narrow pass where the modern convent of Dafni stands, came down on the east coast of the bay of Eleusis, and passed over the marshy sand plains, whose fish formed a part of the revenue of the great temple of Eleusis. [See Eleusis.] This lagoon, or at least one of them, seems marked in the recent survey, as in some measure communicating with the water of the bay. From the northward direction of the road passed over the rocky headland, the acropolis of Athens, and the pass through which the old road ran passed over the rocks above the Rhetia to Eleusis, from which town the road continued, as it now does, below the Horns on the west side of the bay to the town of Megara. When Attica was invaded by the Persians, the fertile plain of Eleusis was the first to suffer from the rampages of the enemy. (Thucyd. i. 19.) We cannot determine in what part of the Eleusinian plain we must look for the Thrian plain; some modern writers have placed it to the west of Eleusis.

Attica is a country which, for the most part, is irrigated, and where the soil is not irrigated, it is generally unproductive. Two small streams water the Eleusinian plain: one, called the Cephissus, descends from the great mountain of Cithaeron, through the narrow plain of Eleutherus, into that of Eleusis; the other small stream, known as the Phrens, has its range of hills somewhat farther to the south of Eleusis, and runs through the Thrian plain towards the Rhetia. The remains of an arched aqueduct intended to supply Eleusis with water are still seen stretching across the plain towards Eleusis from the upper course of this latter stream. The Cephissus, though almost dry in the warm weather, brings down from Cithaeron a prodigious quantity of water in the wet season, and in ancient times mounds were raised to protect Eleusis from those sudden inundations.

The Cephissus depends on the Attican plains, especially on the Cephissus. Its most north-eastern source is at Triennius (Strab. p. 400), between the northern face of Pentelicus and Parnes; another branch rises on the south face of Pentelicus, and flowing westward joins the main stream north of Athens; one other rises on the northmost part of Phyle and runs through the Thrian plain towards the Rhetia. The remains of an arched aqueduct intended to supply Eleusis with water are still seen stretching across the plain towards Eleusis from the upper course of this latter stream. The Cephissus, though almost dry in the warm weather, brings down from Cithaeron a prodigious quantity of water in the wet season, and in ancient times mounds were raised to protect Eleusis from those sudden inundations.

At a time when this interesting province is beginning to be more completely examined, it is necessary to use existing authorities with more caution than if all prospects of future information were shut out. We shall here state briefly a number of facts as they occur, and follow up those events which are best established. The great mass of the mountains of Attica are calcareous, but the stone differs very much in quality and colour. The best specimens of white marble from the quarries of Mendeli (the ancient Pentelicus) are very white, hard, and fine-grained; but owing to numerous little pieces of flint or quartz imbedded in it, this marble is exceedingly difficult to be worked by the sculptor. Between Pentelicus and Parnes, the mass of rocks appears to be mica slate, which is also the character of the Cepris or Tithorea marble, in former times quarried on Hymettus, and, as well as that of Pentelicus, was an article of export: this marble extends to the promontory of Zoster. Near the boundary of Megara in the Horns, there is an immense deposit of conchiforous limestone, which did not escape the notice of Pausanias (i. 44. 1.); also, in the islands off the coast of Attica, Hymettus, and the Saronic Gulf. The silver-mines of Laurium may probably still be worked to advantage with the aid of modern improvements, for we can hardly suppose that the ore is exhausted. Salt was made on the Attic coasts, but this could not be worked by Attics. It cannot produce much grain in proportion to her surface, and with the exception of some of the best lands, the husbandman will cultivate more profitably the olive, fig, and grape: all kinds of leguminous vegetables can be raised, and the banks of the Cephissus, and the eastern plains of Attica.
The tribes (paleai) established by Cleisthenes were Hippothoeotia, Antiochia, Cecropia, Erechtheia, Pandionis, Leontis, Argia, Acastantis, Chneis, Antaius. The ten tribes were subdivided into 174 demi or townships, each demi apparently containing a town or small village. Though the tribes (paleai) were dissimilar, and though neighbouring demi were generally classed under the same tribe, there are numerous examples of contiguous demi assigned to different tribes; just as we sometimes observe parts of England or Ireland completely imbedded in a different county. The most frequent tribe of the Attic demi was Ar革arme. (Thucyd. i. 19.) Under Macedonian influence two tribes were added, Antigonia and Demetrias; but these were afterwards changed to Pose- demus and Attalia. A new tribe was added in honour of Huldrian.

As to the antient population of Attica, it is difficult to come to any satisfactory conclusion. Mr. Clinton considers, that about a c. 317 it may have been 397,660, a large population for such a territory (being above 700 miles square), even if we take into account that it contained a populous city. The numbers, however, with the exception of the Metoci (who are probably exaggerated in Mr. Clinton's calculation), are fairly deduced from the MSS. of Diodorus of Sicily, a countryman of Attica, in the old MSS. of this it is reported in Athenaeus (p. 272). The reader is referred to Mr. Clinton's essay for the various arguments. (Appendix to the first volume of the Pasti Helmei.) With respect to some of Mr. Clinton's subsidiary arguments deduced from the area Astica (which is estimated as 744 square miles, the Salama and the amount of its products, we may observe, first, that the area as determined from all maps hitherto published is necessarily incorrect, the coast line having only been surveyed in 1828 and 1829, and the interior boundary line being still very inadequately laid down; and secondly, that the calculations as to the possible or probable production of grain in Attica are at present exceedingly hazardous, and probably far from the truth.

Attic dialect., a term which is applied to designate one of the varieties of the antient Greek language. The Attic dialect was spoken in the territory of Attica, in the Transactions of the Royal Society of Literature, is a most excellent and accurate work. The reader may also consult Kruse's Hellas, but with caution, and not without the assistance of Leake. See also Thucydides, De Interpreta de la Grecia, Lexicon, 1837; the Unexpanded Antiquities of Attica; and Herrmann's Lehrbuch, &c.

ATTIC DIALECT., a term which is applied to designate one of the varieties of the antient Greek language. The term Attic is applied in particular to the dialect of the Attic earth, is supposed to have been derived from the old inhabitants of Athens and the Ionians; and in conformity with this fact, we find it stated (Strabo, p. 333) that the Ionic form of the Greek language, or the Ionic dialect, is as it is generally called, was the name of the tribe which the ancient Attic earth, so called, was named. But in course of time the language of Attica, which was improved by a great number of writers, gradually acquired a distinct character, and also a decided pre-eminence, owing to the excellent works which were written in it on almost every branch of literature. Most of the great works of antiquity which have been transmitted to us are written in the Attic dialect. Some writers have made, and some three divisions of the Attic dialect, with a few ex-attic writers, but the general division of the Attic dialect into such tribes was sufficiently exact. To the former division belong: Euboea, Siphocles, Epidaures, Aristophanes, Antiphon, Thucydides, &c.; to the latter, Demosthenes, Euboeae, and the com- monly called Attic, Plato, and indeed Aristophanes also, may be considered as speaking a character somewhat intermediate between the two classes, and the name of middle may consequently be given to it; but it would be difficult to say exactly what a writer of this class is to be distinguished from the writers of the new Attic.

After the time of Alexander, when the Greeks were more united as a nation, the superiority of Athenian literature made the language of Athens the common language of the world, and the name which was given to the Greek, was the name of the Attic dialect. It was in the Attic dialect that the ancient Attic writers, not an Athenian by birth, who
Atticus, whose health seems to have been particularly good, if we except some attacks from ague, died at the age of seventy-seven, March 31, B.C. 34, of voluntary starvation, after he found that a disease, with which he was smitten, was incurable. He was the author of several works, none of which have been preserved. He was also a man, in which he observed a strict chronological arrangement, and traced with much diligence the genealogy of illustrious families. They included a period of seven centuries, and the names of their ancestors were termed by the Dorians of Sicily, and others, to the writers who use the Common Dial. Some late writers affected rather to imitate the pure old Attic standard than to use the modified Attic, or Common Dial, as Lucian, Arias, and the in his Analecta, Aristides. The name of Attic (Ἀττική) was given to this artificial class of writers, but especially to such imitators as Aristides. [See ARISTIDES, ΑΡΙΣΤΙΔΗΣ.] The real characteristics of the Attic dialect can only be known by a careful study of the works. The reader may consult Mitford, On the Greek Living Dialect, by Sturz, 1st ed.; Buttmann's Greek Grammar; and Matthæi's Greek Grammar.

ATTICUS, T. POMPONIUS, was descended from a very wealthy family which formed one of the chief elements of the equestrian order. He was born the 9th of March, B.C. 109, being three years older than Cicero and Pompey, and nine older than Caesar. He is sometimes called Q. Cecilius (Cic. ad Att. iii. 20), a name which he derived, as being the descendant of a patrician uncle Cecilius, who left him a considerable estate.

His early years were spent under the direction of his father, who was a literary man in his time; and his education is proved by the subsequent career of Atticus. He lived during the most stormy period of Roman history, and yet he continued to retain the friendship of the various parties which took an active part. He was a man of great public affairs. Though his life was not active in politics, he was ever ready to help the unfortunate, to whatever party they might belong. He left a large inheritance to his son Marius after he had been declared a public enemy; and yet he was on such terms with Sulla, that his general anxiety to take him with him to Italy on his return from the Mithridatic war; but Atticus excused himself without losing the favour of Sulla. He was also a good friend to Grabius, Caesar, Pompey, Brutus, Antony, and Augustus; but his most intimate friend was the Roman general, who kept up a constant correspondence. Pomponia; the sister of Atticus, was married to Cicero's brother Quintus; but the match was not a happy one, as there is plenty of evidence to show that Quintus and Pomponia did not agree. We possess the letters of Cicero to Atticus, in six books, one of the most valuable records of that important period. Atticus spent a considerable portion of his life at Athens (from 85 to 63 B.C.), having proceeded to that city about a.c. 83, that he might not be witness of the misery caused by the faction of Cinna and Sulla; and it is not unlikely, though we have no information on the subject, that he derived the name of Atticus from his residence in this city. He was an intimate friend with the Athenians, that the day of his death was termed by them the 9th of Mare, and that the name of Atticus was given to the place where he was buried, near the Areopagus, and that he had also an estate in Epirus, near Butrintum, where he appears to have spent a considerable part of his time. He returned to Rome a.c. 63, when the political horizon seemed somewhat more bright, the same year in which Horace was born. He was now a man of years, and he retired to a life, which was spent in the delights of literary retirement. He married at a late period (Feb. 12, a.c. 56) Plis, of whom we know nothing more than the name (Cic. ad Att. iv. 4), and who lived long enough to have a daughter, Pomponia (called by Cicero also Cecilia and Attentius). Married M. Vipsanius Agrippa, the intimate friend and able minister of Augustus; and his grand-daughter by this marriage, Vipsania Agrippina, was married to Tit. Claudius Nero, the son of Tiberius. After Vipsania was divorced from Tiberius, she married Messus Gallus, by whom she became the mother of a numerous family.

Attilia, this formidable conqueror was the nephew of Roas, a king or leader of the Huna, who at the beginning of the 5th century was established with his hordes in Pannonia, on the south bank of the Danube. Attila and his brother Bleda succeeded Roas a.d. 433. The first act of their reign was to conclude a peace with the Emperor Theodosius II. on terms disgraceful to the majesty of the Roman empire. This peace was renewed at intervals, and Attila extended his dominions from the Danube eastward to the Volga, and northward even to the Baltic. A doubtful provocation, or an unscrupulous ambition, urged him, in 434, to attempt the conquest of the Goths. He was defeated, and forced to retreat. He returned to his old home, and soon after, Attila, impatient of a partner in the throne, procured the assassination of his brother Bleda. In 448 the historian Priscus accompanied ambassadors sent to apologist for Attila for the non-fulfilment of the treaty; and thus, Attila saved himself from destruction, and the ambassadors could discover some evidence of his good intentions in the workmanship, as well as barbarous magnificence in the display of the rich spoils of his wars. A.D. 448. Attila and his troops then passed over the Danube and invaded the country of the Huns, and the ambassadors discovered some evidence of his good intentions in the display of his warlike power, as well as barbarous magnificence in the display of the rich spoils of his wars. A.D. 448. Attila and his troops then passed over the Danube and invaded the country of the Huns, and the ambassadors discovered some evidence of his good intentions in the display of the rich spoils of his wars. A.D. 448. Attila and his troops then passed over the Danube and invaded the country of the Huns, and the ambassadors discovered some evidence of his good intentions in the display of the rich spoils of his wars. A.D. 448.
tions. They were soon invited to a sumptuous entertainment, at which the guests were all served in silver and gold: but a dish of plain meat on a wooden trencher was set before the king. Attila's beverage was equally simple and frugal. The rest of the company were excited into loud and frequent laughter by the fantastic extravagances of two buffoons; but Attila preserved his usual inflexible gravity. A few years later he faced the prodigious task of procuring the assassination of this formidable enemy. Attila was acquainted with the real object of the mission; but he dismissed the culprit, as well as his innocent companions, unceremoniously, and compelled him to return, ever, to stone for his base attempt by a second mission, loaded with magnificent presents, which the king of the Huns was prevailed on to accept, and he even made some concessions in return. Theodoric died not long after (July 455). He left a son, who is said (Anglo-Saxon Chronicle) to have been very virtuous and mild; and this Marcian.

Attila at this time was collecting an enormous army, and threatened both divisions of the Roman world. To each emperor he sent the haughty message, 'Attila, my lord and thy lord, command thee to prepare a palace for his immediate reception.' To this insult was added a demand upon Marcian for the arraignment of any man who had ever been in personal correspondence with Attila, and sent him a ring in token of her affection. He received her advances very coolly, until at this time it suited him to demand her hand, with half the western empire as his dowry. The demand was refused, but the focus of Attila satisfied him; he assigned the reasons assigned: but he did not the less turn his arms against Gaul. A pretence for entering it was all he wanted; and he closed with a proposal from the son of Geneseric, king of the Barcis, to attack the Goths. He began by craft what was to be carried on by violence and terror. Valentinian was assured that his warlike preparations were levelled against Theodoric only: that he should ever look on the Romans as his friends, unless they espoused the cause of his enemy. At this time he exhibited Theodoric to join him against the Romans, as their common foe. Meanwhile, in midwinter he marched through Germany without halting till he reached the Rhine early in March. There he destroyed the forests of Teutoburg, down whole forests to build boats, and passing the river entered Gaul, several cities of which opened their gates to him, on his professions of friendship to the Romans. He then threw off the mask. The calamities attendant on this invasion he is said to have described by five names, a contemporary, afterwards bishop of Clermont, and by the historians of France, who have collected all the anient testimonies. But his progress was at length arrested by the combined armies of the Gauls, and Goths, under the command of Attila and Theodoric. They compelled him to make a hasty retreat from the siege of Orleans, and came up with him in the extensive plains surrounding Clavous-sur-Marne, a country well adapted to the cavalry of the Huns. There one of the most bloody battles recorded in history was fought, in which Theodoric was slain. The issue might have been considered doubtful; but the advantages of victory were gained, for Attila found it expedient to retreat. He moved slowly to the Rhine without molestation, and retired into Pannonia (A.D. 451).

After having reinforced his army, he returned to repeat his demand of the princess Honoria in the plains of Italy. He mastered the unguarded passes of the Alps, either in the latter end of 451, or in the beginning of 452, and advanced at once to Aquileia, the metropolis of the province called Venetia, which he invested, and utterly destroyed after a siege of three months. Not a house was left standing; nor was person left alive who fell into the hands of the conquerors. Attila, however, did not pursue the game, undertook the same fate. It is commonly believed that the city of Venice owed its origin to the inhabitants of the mainland, who fled at this time to the islands in the Venetian lagoon, called Cressata, or Cressica, speaking of the Venetians, as he tells those of the French, who had no other fence against the waves than hurdles; no food but fish; no wealth besides their boats, and no merchandise but salt, which they exchanged for other provisions. Attila treated Milan and Pavii very severely: he neither fired the buildings, nor massacred the inhabitants. From Milan, Attila purposed to advance upon Rome; but as he lay encamped on the banks of Lake Benacus, he was approached by a supplicant, a debauchee, and a beggar, named Tertius (Stephen) [A.D. 452]. He received them with kindness and respect, and consented to a truce with Rome, the duration of which was to depend either on the fulfilment of his claims on the princess Honorina, or the payment of a sum of money. Honorina, constrained in this instance to check the implacable temper of the Hun. His truce, inured to the rigours of a northern climate, and the rude simplicity of a pastoral life, began to melt away in the luxurious plains of Italy; and, after great distress and loss, still hung on his march with a constant hostility. His friends reminded him of the fall of Alaric, after having plundered the Eternal City, and the example was not without effect upon his own mind. Nor were the dignity and eloquence of Leo void of influence; and the memory of that influence probably was preserved and amplified in the fable which represents St. Peter and St. Paul appearing to the barbarian, and threatening him with instant death if he would not release the captives and pay the money; but that, on the signature of this treaty, Attila retired beyond the Danube.

The death of Attila took place in 453. The common opinion is, that he died by the bursting of a blood-vessel on the exertion of some violent emotion. But it is added to his many other wives: some, with a natural suspicion, impune it to the hand of his bride. Jornandes, transcribing, probably, from Priscus, relates the current story, and the solemn ceremony of his last farewell. He died after he had subdued so many countries in so short a time. The vanity of the Romans refused to honour Attila with the title of king; they only styled him general of their armies, disguising an annual tribute under the name of a gift. He was afterwards deified. A eulogy, given by Jornandes, presents the genuine features of the Gallic race: he was low in stature, broad-chested, and of powerful frame—dark-complexioned, with a few straggling hairs in the place of beard—with a large head, flat nose, and small eyes. His carriage was fierce and haughty: and no one could behold him without concluding that he was sent into the world to disturb it. It was a saying of his own, that the grass never grew on a spot where his horse had trod. A story is told by Priscus, the Franciscan monk, of the Frankish king at his death, that Attila was morose and importunate. The Frankish king at his death, that Attila was morose and importunate. The Frankish king, to make the story more touching, added to his titles of that of Flagellum Dei. His empire was overthrown and disjoined immediately upon his death, by the disputes and disensions of his sons and chieftains; the fate of impiety unholy empires hastily erected by violence. (Jornandes, De Rebus Geticis, and Priscus, Excerpta de Legationibus,) furnish the best authentic materials for the history of Attila. For modern compilations, see Busi, Histoire des Peuples de l'Europe, and Du Guignes, Histoire des Huns, besides the works of Gibbon, which have been our chief authority, and the Anc. Hist.)

ATTELBRUGH, a town in Norfolk, in the hundred of Shropham, on the high-road from London to Norwich, through Thetford; 14 miles from Thetford, and 14 from Wymondham. It is now a small and unimportant place, but appears to have been of some consequence in former ages, though its origin and early history are involved in considerable obscurity. The church town and aisle, being part of the Anglo-Saxon church originally built here, but now restored, is of the edifice of later date, and the decorated style, with some fine windows and excellent details. It is a cross church, and collegiate. The foundation of the college of the Benedictines, the monks, and the priors of Richard II., and carried into effect by his executors or trustees in the time of Henry IV. It consisted of a master, warden, and four secular preists. Attilburgh has three fairs in the year, one a market and a fair of worship for Methambo and Bapana. The population in 1831 was 1819.
ATTOCK, a city and fortress on the east bank of the Sinds or Indus, within the territory of Runjeet Singh, Rajah of Lahore, in 32º 30' lat. and 72º 30' long., has been captured by Akbar in 1591, and takes its name from that branch of the Indus which flows from Caubul and joins the main stream about eight or ten miles above Attock. Ferishta calls this branch of the Indus 'Nilah,' or Blue River, because of its resemblance of a dark blue. According to Mr. Rennell, the name of Attock, which in the original language of the country means forbidden, was given to it from the circumstance of its forming the original boundary of Hindostan in that quarter, which body of water, however, was considered not safe for a residence, over which they had not special permission. According to Dr. Robertson (Historical Disquisition concerning Antient India, p. 93), this place is mentioned by Ptolemy, as well as by an eastern geographer, as a place named Aradun, on the river Oponbhe. They give its latitude 32º 30', which position agrees more nearly with modern observation than it has usually been seen in similar cases.

It is generally admitted that Alexander must have crossed the Indus on his invasion of India, in the spring of 336 B.C., at or near Attock; but it is quite as likely that he crossed above or below, as just at the place. It is also believed that Timur, when he invaded India in 1398, crossed the Indus at the same place; which was also the route of Nadir Shah in 1738.

The Indus, as it flows in front of Attock, is nearly 800 feet (260 yards, according to Elphinstone) broad, and of considerable depth; but it runs with so rapid a current that no vessel can be anchored in it. The banks and islets are of black stone, have acquired smoothness from the force of the stream and the constant friction of the particles of sand which it carries down, so that they shine like polished marble. Notwithstanding the rapidity of the stream, it is easy to cross in boats, and the water is navigable within a year after the first floods. The Rajah of Lahore now keeps a bridge of thirty-seven boats at Attock, for the purpose of transporting his army across the river.

Attock was formerly the residence of the Afghan government, and was then a place of considerable importance: but since 1818, when it came into the possession of the Rajah of Lahore, it has been fast falling to decay. It is built in the form of a parallelogram, and stands on a low hill on the east bank of the river, to which it offers a front of 1200 feet: the walls, which recede from the river, are of double that length: they are built of polished stone, and make a handsome appearance. The place has the disadvantage, in a military point of view, of being commanded by both banks of the Indus. The Indus is navigable by small vessels to the Rajah of Lahore, on the opposite bank of the river. (See Rennell's Memoir; Elphinstone's Cabul, p. 623; Report of Committees of House of Commons on Indian Affairs, Second Report; Rennell's Memoir on the Indus. London Geog. Journal, 1833.)

ATTORNEY is a person substituted (atourné, attorney), from atourner, icm hee. to substitute, and signifies one put in the place or turn of another to manage his concerns. He is either a private attorney authorized to conduct cases, and do other acts for his principal by an instrument called a letter of attorney, or he is an attorney at law, practising in the several courts of common law. The latter description only will be treated of under this head. As to the former, see ATTORNEY AT LAW.

The ability of an attorney to act in a professional capacity is derived from his having been admitted to practice law in his state. An attorney must be of good moral character and have completed the necessary legal education and training to be eligible for admission to the bar. The specific requirements for admission vary by jurisdiction, but generally include passing a bar exam, meeting ethical requirements, and demonstrating the ability to practice law.

1st. The admission of attorneys to practise, their enrolment, and certificates:—
2d. Their duties, longa, privileges, and disabilities.
3d. The consequences of their misbehaviour.
4th. Their remedy for recovering their fees, &c.
1st. The admission of attorneys to practise, their enrolment, and certificates.—The earlier regulations as to the entry of attorneys into the bar are in the case of 3 Jan. 1654 (25 Car. I. c. 1, and 1654) required that he should serve for five years as clerk to some judge, serjeant, counsel, attorney, or officer of court; that he should be found, on examination by appointed practicioners, of good ability and honesty; and that he should 'be situated, for a time, over without special permission. According to the 2 Geo. II. c. 33, s. 5, now in force; which provides that no person shall practice as an attorney in the superior courts unless he has been bound by contract in writing to serve for five years as a clerk to a regular attorney, and has continued five years in such service, and has been afterwards examined, sworn, admitted, and enrolled in manner in the act mentioned, under penalty of 50l. and an incapacity to sue for five years. This provision is by subsequent statutes extended to practising in the county court or the quarter sessions; and by 34 Geo. III. c. 14, s. 4, any person practising as an attorney without due admission and enrolment shall be disabled from suing for his fees. By the 1 & 2 Geo. IV. c. 28, 3 Geo. IV. c. 16, persons having taken the degree of bachelor of arts, or bachelor of law, in the university of Oxford, Cambridge, or Dublin, and having served under another attorney for six years, shall be admitted as attorneys, without having been actually employed during the three years by such attorney or his agent in the business of an attorney, shall be qualified to be admitted as fully as if they had served five years; provided the degree of bachelor of arts was taken within nine years of their admission. The degree of bachelor of law was taken within eight years after matriculation: the binding to the attorney must also be within four years after the taking of the degree. By the 22 Geo. II. c. 48, in the affidavit made by the subscriber of the articles of the execution thereof by the attorney and by the clerk, which affidavit must be filed in the court where the attorney is enrolled, and be read in open court before the clerk is admitted and enrolled an attorney. Acts of indemnity are however occasionally passed, relieving persons who have neglected to file their affidavits within the limited time. By the last general stamp act, a duty of 12d. is imposed upon the articles of clerkship of attorney, and 1½d. on the counterpart; and by the Geo. III. c. 14, s. 4, these affidavits must be accompanied with the certificate of the proper officer in that court where the party proposes to practise as an attorney. No attorney is allowed to have more than two articled clerks at once, unless only vowing have the court's permission; and for the time during which such attorney holds any benefit, he is bound to give the court's notice on his own account, and not at any time during which he himself is employed as clerk by another attorney. The clerk, in order to be admitted an attorney, must actually serve five years under his articles; but by 22 Geo. III. c. 44, in case the attorney dies, or discontinues to practise, or the articles are by mutual consent cancelled, then the clerk may serve the residue of the time under articles to any other practising attorney, and the new articles are not subject to stamp. 34 Geo. III. c. 14, s. 5, except the duty of 1½d. The articled clerk may serve one year, but not a longer time, with the agent of the attorney to whom he is articled: a plan generally adopted by country clerks, who thus acquire a year's experience of the practice in London, without delays of their admission; and by the 1 & 2 Geo. IV. c. 48, s. 2, an articled clerk who becomes bond fide a pupil to a barrister, or certificated special pleader, for one whole year, may be admitted in the same manner as done by the regular articles for the year, which will render him bound. Before the clerk can be admitted an attorney, he must cause an affidavit of the actual service under the articles, sworn by himself or the attorney with whom he has served, to be filed in the court to which he has been admitted; and, by the Geo. IV. c. 48, a Queen's Counsel has only paid the stamp duty on the articles, and that he will truly and honestly demean himself as an attorney; and must take the oaths of allegiance and supremacy, and subscribe the declaration against popery, in Romano-Catholic, the declaration and oath prescribed by the statute 31 Geo. III. c. 32, s. 1. The attorney pays a stamp duty

Vol. III. — K
on his admission of 51. His name is then enrolled without fee by the officer of court, in books appointed for the purpose: to which books all persons have free access, without payment of any fee. When the attorney is admitted, he subscribes a roll, which is the original roll, and which is preserved by the court, and a recorded list of his officers, and from which the names are copied into the books. An attorney duly sworn, admitted, and enrolled in any of the superior courts of law, may be sworn and admitted in the courts of equity without fee or stipend. The court of Westminster may be sworn, admitted, and enrolled, an attorney of his Majesty's courts of law; and an attorney in a superior court at Westminster is capable of being admitted in any inferior court. An attorney duly admitted and sworn of record at Westminster, may, by the consent in writing of any other attorney of another court, practise in the name of such other attorney in such other court, though not himself admitted in such court. But if any sworn attorney knowingly permit any other person, not being a sworn attorney of another court, to practise in his name, he is disabled from acting as an attorney, and his admission becomes void.

In addition to swearing, admission, and enrolment, an attorney, in order to be duly qualified for practice, must take out a certificate at the Stamp-office every year between the 1st November and 16th December for the year following. The duty on which is 12l. if he reside in London or Westminster, or within the county of Middlesex, or county and boroughs within the city of Edinburgh, and has been in practice three years; or 6l. if he has been admitted a less time: and if he reside elsewhere, and has been admitted three years, 6l.; or if he has not been admitted so long, 4l.; and if he practise in any of the above situations, and is in the receipt of duty, he is liable to a penalty of 50l. and an incapacity to sue for his fees. (55 Geo. III. c. 184, s. 27.) But by the 44 Geo. III. c. 98, s. 10, these penalties can only be sued for by the Attorney General, like other stamp penalties, and acts of indemnity are occasionally passed to relieve attorneys who have neglected to take out their certificates in due time. The omission by an attorney to take out a certificate for one whole year incapacitates him from practising, and renders his admission void; but the courts have power to re-admit him on payment of the arrears of certificate duty, and such penalty as the courts think fit. (37 Geo. III. c. 90.)

9. The duties, functions, privileges, and disabilities of attorneys.—The principal duties of an attorney are care, skill, and integrity; and if he be not deficient in these essential requisites, he is not responsible for mere error or mistake in the exercise of his profession. But if he be deficient in either, or can neither supply the want of his client, he is liable to a special action on the case; as, if the attorney neglect on the trial to procure the attendance of a material witness; or if he neglect attending an arbitrator or other officer in whom the cause is referred; or if he omit to charge a defendant in custody at the suit of his client, in execution within the proper time. When an attorney has once undertaken a cause, he cannot withdraw from it at his pleasure, since this would injure his client; and though he is not bound to proceed if his client neglect to supply him with money to meet the necessary disbursements, yet before an attorney can abandon the cause on the ground of want of funds, he must give a sufficient and reasonable notice to the client of his intention. When deeds or writings come to be impressed, an attorney has the right of impressing them; but the court, on motion, will make a rule upon him to deliver them back to the party on payment of what is due to him on account of professional services and disbursements, and particularly when he has given an undertaking to re-deliver them; but, unless they come to his hands strictly in his business as an attorney, the court will not make a rule, but leave the party to bring his action against the attorney.

An attorney duly enrolled and certified is considered to hold his commission for the time that his name stands on the roll; but the court has still some privileges, though they are now much narrowed. Till lately he was entitled to sue by a peculiar process, called an attachment of privileges, and to be sued in that court; but the practice is now disallowed for uniformity of process. 2 Will. IV. c. 29, has abolished the privilege of not giving bond, and an attorney now sues and is sued like other persons. By reason of the supposed necessity for his presence in court, an attorney is exempt from offices requiring personal service, as those of sheriff, constable, overseer of the poor, and also from serving as a juror. These privileges being allowed not so much for the benefit of attorneys as of their clients, are confined to attorneys who practise, or at least have practised within a year.

An attorney is no subject to some disabilities and restrictions. No attorney practising in the King's Courts can be under-sheriff, sheriff's clerk, receiver, or sheriff's bailiff. (1 Hen. V. c. 4.) No clerk of the peace, or his deputy, can assume the name of attorney, and be holder of a penalty of 50l. (22 Geo. II. c. 36.) By rule of Michaelmas Term, 1654, no attorney can be lese in ejectment, or bail for a defendant in any action. By 3 Geo. II. c. 18. a. 2, no attorney can be a justice of the peace while he practises at the Quarter Sessions, and must be a Commissioner of the Land Tax without possessing 100l. per annum. By 12 Geo. II. c. 13, no attorney who is a prisoner in any prison, or within the rules or liberties thereof, can sue out any process, or commence or prosecute any suit, under penalty of being struck off the roll, and incapacitated from acting as an attorney for the future; and the punishment is the same for any attorney who suffers an attorney in prison to prosecute a suit in his name: but an attorney on paying a fine of 10l. is not incapacitated from acting as an attorney for the future. If he shall be convicted of malpractice in his practice, he shall not be guilty of misdemeanour in confinement; and the statute does not prohibit his defending, but only his prosecuting suits.

3. The consequences of an attorney's misbehaviour.—The court which has admitted an attorney to practicet with a view to the public benefit of an individual, is entitled to the services of an attorney, so long as he does not misbehave. If he is charged on affidavit with fraud or malpractice, contrary to justice and common honesty, the court will then consider whether he can be convicted of the charge, and if he does not distinctly deny the charges imputed to him, or if he swear to an incredible story in disproof of them, the court will grant an attachment.

If the misconduct of the attorney amounts to an indictable offence, the court will in general cause him to be indicted by the party complaining, and will not call upon him to answer the matters of an affidavit. If the attorney has been fraudulently admitted, or has been convicted of felony or any other offence which renders him unfit to practise, or if he has knowingly named to be used by a person unqualified to practise, or if he has himself acted as agent for such a person, or if he has signed a fictitious name to a demurrer purporting to be the signature of a barrister, or otherwise grossly misbehaved himself, the court will order him to be struck off the roll of attorneys. But striking off the roll is not a perpetual disability: for in some instances the court will permit him to be restored, considering the punishment in the light of a disciplinary measure.

4. The attorney's remedy for recovering his fees. An attorney may recover his fees from his client in an action of debt or indebitatus assumptus, which he may maintain for business done in other courts as well as in that of which he is admitted an attorney. But an attorney cannot recover for conducting a suit in which, owing to gross negligence or other cause, the client has had no benefit whatever from the attorney's superintendence. By the 2 Geo. II. c. 23, s. 23, no attorney shall sue for the recovery of his fees or disbursements, in the suit of his client: and even if he is admitted an attorney, he must himself act as agent for such a person, or if he has signed a fictitious name to a demurrer purporting to be the signature of a barrister, or otherwise grossly misbehaved himself, the court will order him to be struck off the roll of attorneys. But striking off the roll is not a perpetual disability: for in some instances the court will permit him to be restored, considering the punishment in the light of a disciplinary measure.
business done in a court so as to render his bill subject to taxation. For these we must refer to Todd's Practice, tit. Attorney.

To assist an attorney in recovering his costs, he has a lien for the amount of his bill upon the deeds and papers of his client, which has come into his hands by reason of his professional employment; and till his bill be paid, the court will not order them to be delivered up, nor can an action be maintained for them. The attorney has also the same lien on any money recovered by his client which comes to his hands in any way. In addition to this, the attorney has the benefit of a lien upon the money of his client, in the hands of others, which is created by Rule 2 Will. IV. reg. 1, s. 83. (See Bac. Abrdgment, tit. Attorney, 7th edition; Todd's Practice, 9th edition, chap iii and iv.)

ATTORNEY-GENERAL. The attorney-general is a ministerial officer of the crown, specially appointed by letters-patent. He is, in principle, nothing more than the attorney for the king, and stands in precisely the same relation to him that every other attorney does to his employer. The addition of the term general to the name of the office, implies an additional dignity of the attorney appointed to act for the crown in particular courts, such as the attorney for the Court of Wards, or the master of the Crown Office, whose official name is merely attorney and attorney for the king in the Court of King's Bench. The dignity of the attorney-general, as the holder of a lien upon the wealth of the kingdom, has become one of great dignity and importance.

The duties of the attorney-general are to exhibit informations in all criminal cases, to superintend the conduct of all proceedings, and to lay the charges of the crown. He has various miscellaneous duties, as to tend to disturb or endanger the state; to advise the heads of the various departments of government on legal questions; to conduct all suits and prosecutions relating to the collection of the public revenue of the crown; to conduct all suits for the protection of the lands and other possessions of the crown; to institute and conduct suits for the protection of charitable endowments, in which the king, as patron patriarch, is entitled to interfere; and generally, in all courts, where the interests of the crown are in question.

The present rank and precedence of the attorney-general have frequently been the subject of discussion and dispute. In the early history and origin of this office, upon which the question of precedence in a great measure depends, is matter of great obscurity. There is no doubt that at all times the king must have had an attorney to represent the interests of the crown in the several courts of justice; but in what capacity and to what extent he held this rank and importance as the attorney-general of the present day. There are no traces of such an officer till some centuries after the conquest; and it is clear that, until a comparatively late period, the king's sergeant was the chief executive officer of the king (Spelman, Gloss. tit. Serviens ad legem). In the old form of proclamation upon the arraignment of a criminal, the king's sergeant was, till very lately, always named before the attorney-general; and previously to the Commonwealth, he invariably spoke before him in all criminal prosecutions, and performed the duty of opening the pleadings, which since the Commonwealth has always been done by the junior counsel. In the reign of James I. a curious altercation between Sir Francis Bacon, who was then attorney-general, and a sergeant-at-law, upon this subject, is related in Bulstrode's Reports, vol. iii. p. 32, upon which occasion Lord Coke, who was then chief justice, said that no sergeant ought to move before the king's attorney, when he moves for the king; but for other matters, to have any voice in it, in order to declare that when he was the king's attorney, he never offered to move before a sergeant, unless it was for the king.

All questions respecting the precedence of the attorney-general and the sergeants were terminated by a special warrant of his late majesty, George V., when Prince Regent, in 111, by which it was arranged that the attorney-general and the solicitor-general should have place and audience at the head of the English bar.

A discussion arose during the session of parliament 1784, as to the Scottish appeal in the House of Lords, upon the question of precedence between the attorney-general and the lord advocate of Scotland, which was finally decided in favour of the former.

ATTRACTION, from two Latin words signifying a drawing towards, a term the meaning of which has been obscured by the verbal disputes of a century and a half. Considering the great importance of correctly understanding a word which is in such universal use, we shall at once proceed to point out the various ways in which it has been misunderstood. The applications of the word to the experimental facts which it implies, such as attraction of gravitisation, attraction of cohesion, capillary attraction, &c., must be looked for under the heads Gravity, Cohesion, Electricity, &c.

When a word has been the subject of dispute, especially when there have been ignorant and learned men on both sides, it generally happens that it has been applied to the various senses in which attraction has been used. We shall therefore explain what we mean by mathematical attraction, mathematico-physical attraction, and physical attraction.

The reader may supply any terms which he likes better, if he will take care to distinguish their meanings.

(1) When we see the body A move towards B, we see the effect that the attraction of A on B has produced in B. This attraction is known as an attracting power, and the body A is known as the attractor, and the body B as the attractee. If we could draw a curve showing the relation of the distance between A and B to the force of attraction, we might then be able to calculate the force of attraction at any point, and from this the effect of the force of attraction on the body B. We might then be able to calculate the effect of the force of attraction on the body B, and from this the effect of the action of the attracting body A on the body B. We might then be able to draw a curve showing the relation of the distance between A and B to the force of attraction, and from this we might be able to calculate the effect of the force of attraction on the body B, and from this the effect of the action of the attracting body A on the body B.

But if we only see the fact, and measure the law of the motion, and find thereby that A moves as it would move if it had an attracting power on B, and then find what is to be found in the usual way, we may be using the same law may be used as a means of deducing future phenomena. A person who admits so much, admits what we mean by mathematical attraction. We might instance various mechanical means of speaking, which in strict physics are false. The sun throws nothing but light, and it is because an opaque body prevents his throwing direct light that there is a shadow. But the phenomenon is as if the sun did throw the positive appearance called shadow, and the phrase is admitted. The sun moves round the earth, and the day should be as long as a day but turns round its axis once a day; but we see the same appearances as would be presented if the sun did move round the earth. But the most direct use of the mathematical law is not in any sense (see), which we speak as if a body really endeavoured to go direct away from a centre, when in truth it endeavoured to keep its own straight line of motion unaltered. But the effect being exactly that of an endeavour to move directly away, the term is admitted, is, not necessarily more liable to be misunderstood than attraction.

(2) When A not only moves towards B, but it is plain that B is in some way or other an agent in the motion of A, there is what we will call mathematical-physical attraction. Place a needle so as to swim on water, and hold a magnet north of it; the needle will slowly move towards the north. But place the magnet east, and the northward motion will be almost immediately destroyed by the restituting nature of the needle, and the needle will move south, and so on for any other point of the compass. Here then, in addition to the conclusions we might draw from the preceding paragraph, we see that the magnet is in some way or other an active agent. In the preceding case, B might be moving north, away, so far as we are supposed to know to the contrary, A might continue its motion just as before; but in the present case, the needle always moves towards where the magnet is, and never moves towards where the magnet is not, no cause and effect, then, have no meaning, if we may not say it. So it is, that the attracting (draws) the needle. But whether it draws it directly, or whether it acts upon some all-pervading fluid (this word is really almost synonymous with unknown cause), as some have supposed. But fluid acts upon the needle, or whether any other intermediate cause exists, is, not necessarily more liable to be misunderstood than attraction.
lying down on the ground, the contrary? We can only answer, that if by drawing down the whole atmosphere, we should alter the day only one second, every part of the atmosphere would do its part of one second. A mind unused to mathematical considerations does not easily comprehend the very small things. One object may be scandalised at the idea that a man's hand would move the earth. He clearly has no idea of any motion smaller than that which his eyes can see.

We shall now cite the experiment of Cavendish, described in Phil. Trans. 1798. The balance was held up by another on a horizontal lever, no horizontal oscillation takes place; but any little disturbance makes the lever turn completely round again and again, till friction restores the equilibrium. Cavendish balanced two balls of lead very exactly, the tension of gravity was measured by the duration of these oscillations; and thence, knowing the duration of the oscillation which the earth creates in a pendulum, and also knowing the relative densities of lead and water, he ascertained that, if the commonly received law of gravitation were true, the earth's mass would be 54 times as great as that of water. Hutton, on recalculating his result, found reason to think the 4 should be 4. We shall immediately notice this result again.

It is evident that matter, a mountain contiguous to a plumb-line or a spirit-level will, in a slight degree, alter the position of the former, or the surface of the latter. We can hardly expect to measure the tilting displacement by direct means; but since the instruments are provided to any one who medical or astronomical instruments, it is plain that a false plumb-line or level may show itself by giving false positions to the stars. And it is well known that the mean of a number of observations detects very small errors, or errors in the magnetic needle, better than the examinations of a single observation. If, in 1772, Maskelyne (one of the best observers of his time) proceeded to Scotland, to try the effect of Scheellhain, he made a great number of observations both north and south of the mountain; he argued that since the plumb-line, if disturbed, must tend towards the mountain in both cases, the discordance he observed would be that of the observer's mind.

He found in this way, that the north plumb-line and the south plumb-line made an angle of 11° 20' more than could be explained by the difference of latitude of his two stations. Hutton, upon examining the mean density of the earth from this result, found it five times as great as water; and very nearly that afterwards produced by Cavendish, when he is considered that both the mean density and form of such a mass as Schebellhain could not be very accurately determined. Maskelyne's close forty observations, which be considered the best; but Baron Zach obtained the same result by reducing the whole 337.

In 1810 the same Baron Zach undertook a similar labour, in which he employed a different instrument, and a different method, to that of observations. He made a geodometrical survey in the neighborhood of Mannheim, and he had three small observatories near Mount Mines, north of that town. He obtained the latitude of these observatories by measuring the whole earth's position with respect to other stations too distant from the mountain to be sensibly affected. He then obtained the latitude of his observatories by astronomical observation on the spot. All three, without exception, gave a difference of 2' between each other, which was remarkable; the position of the observed latitude was greater than the measured, being the sort of effect which would be produced by attraction in the mountain. M. Zach published the fullest detail of his method, and all the observations, in his Attraction des Masses, Avis de 1814. For astronomical measurements, see Hutton's Tracts, vol. ii. and Phil. Trans. 1778.

We now come to the question how the attraction of the par-
ticles of one heavenly body on those of another is established. For details of this very extensive subject, see Gravitation, and articles there referred to. The reason of the argument is this: the phenomena which do take place in the heavens are those which common and undisputed mechanical and mathematical reasoning shou'd take place if the Newtonian law be true. And every phenomenon of importance has been gradually brought under the consequences of this law by various analysts. To recount instances would be to make a summary of astronomical terms; but we will select one, which makes the nature of the phenomena of the tides. For, whereas the place of the moon or a planet is predicted within from half a second to a second of time, the time of high water cannot yet be predicted within some seconds; by force of which this phenomenon may be affected by winds or the nature of the coast, is not difficult to conceive; but the following result is a striking specimen of accordance between theory and fact. If the tides proceed from Newtonian gravitation, the mean tide-day, or interval between successive times of high water, must be equal to the time between the moon's coming on the meridian above and below the horizon, or, roughly speaking, two tide-days make a lunar day. It is found by analysis, that, if the Newtonian theory be true, the amount of the tide, or of the height of the tide, ought to vary as the square of the distance of the moon from the earth, and in the lunar-day, though particular instances of the two may differ many minutes. This is found to be the case: for if the tide-day were more than half the lunar-day by as much as the amount of the tide would be to the amount of the fluid to cause the tide. If a spring, lagged, one with another, by a "daily," two thousand years would have seen high water at every possible part of the lunar-day. But for two thousand years it has never been densified that high water takes place at every part with the same effect. This is the only effect of moon's coming on the meridian. Again, a permanent retardation would, in course of time, bring high water when the moon was precisely on the meridian, for a long succession of days together: a result which never has been observed. In which, according to the Newtonian theory, is impossible.

An immense number of accordances between theory and observation, and there being no assignable discrepancy within the limits of observation, is the proof of the Newtonian law. And it must be observed that this has not been done in a day, or by one person, but in a century and a half, and by philosophers of several countries—not by men prejudiced in favour of Newton, but the contrary; for it was long before his doctrines found their way over to the continent, and the dispute about the invention of fluxions had laid the foundations of a strong anti-Newtonian prejudice. We may observe, also, that England, where the veneration of Newtonamounted almost to idolatry, is not the repository of his system than either France, Germany or Italy; so that the Newtonian system was really fully established by those who had every national and personal bias to endeavour to overthrow it. This is the necessary inductive proof, and the argument, which is so strongly sustained by the name and authority of Newton. This argument, it will be observed, can be clearly brought in any case; for every system, true or false, will have an originator, who will certainly enjoy great reputation as soon as his ideas come to be universally received. But it is an argument which is of force equal both against a true and a false system, not having any tendency to furnish a test between one and the other: unless it be meant to be asserted that nothing is to be considered a system from the time at which it comes from a man of known talents and knowledge.

We shall now give some account of the disputes upon the word attraction; but, first, we shall show how it was used by Newton. The writings of this great man may be divided into mathematical and physical. His Principia are mathematical, interspersed occasionally with scholia, in which conjectures are made upon the cause of this mathematical, or at most mathematico-physical, attraction. These conjectures, or speculations, have all been called physical attraction, as the following extract from the Principia will show:—

"Thus far I have explained the phenomena of the heavens and the sea by the force of gravity; but I have not yet assigned the cause of gravity. . . . The reasons I have yet derived from phenomena, and I do not invent hypotheses. For whatever is not deduced from phenomena is called hypothesis; and hypotheses, be they metaphysical, physical, of occult qualities, or mechanical, have no place in experimental philosophy. . . . It is enough that gravity really exists, and acts according to laws laid down by us; and suffices to explain all the motions of the heavens and the sea." 16

The repeated use of the words not yet," no doubt, would lead us to suppose that Newton thought that the cause of attraction might be discovered; and the sentence next following our preceding quotations shows that he leaned towards the hypothesis that the motion of the tides was the effect of the interaction of the gravitating masses as a whole. But afterwards the hypothesis of those who constituted him their opponent: "Nothing might be added about that most subtle spirit which pervades and lies hid in all dense matter, of which the bodies mutually attract at the smallest distances, &c. . . . But this cannot be explained in few words; neither is there a sufficient number of experimenters by which the laws of action of this spirit can be accurately determined and shown." (Principia, Schol. Genn. at the end.)

Again, in the Optics, Newton dwells upon the same distinction between a phenomenon and its cause, and says that attraction may be caused by an impulse or some other unknown cause. But once for all, both against Newton and Huyghens, we observe, that the Newtonian system is too bold to attempt the difficulties of the question where it found them. If this fluid have the common properties of matter, what is there to explain the mutual repulsion of its particles? Must they have a fluid quality, and an unknown constitution, or must an unknown cause of repulsion take the place of an unknown cause of attraction? If this fluid have other properties unknown to matter as we see it, it is then a purely gratuitous supposition, as difficult as what we call gravitational attraction. It is a matter with one more quality than we can directly see or feel.

Leibnitz called attraction an occult quality, and a miracle. The first term was the horror of the continental philosophers about his time. Their predecessors had attributed various properties to matter which they could not dispose of in a system, which were justly called occult (or hidden). In their desire to be rid of all such, succeeding philosophers would not only abolish the qualities of matter which they had invented, on which they could place absolute power, but they tried also to abolish their own ignorance of the causes of the sensible qualities of matter. They would not have occult causes, and Leibnitz plainly confounds occult quality with occult cause. But it is needless to dwell upon the fact that the ultimate causes of all qualities are occult. When Newton adopted the word attraction, he did not take it and fix the meaning of a word which till his time had been ambiguous; still less, as some have asserted, did he retain a mystical meaning, which his followers retained before the time of Newton, the word attraction was frequently used in our second, or mathematico-physical sense; for example, in the English translation of J. B. Porta, A.D. 1658, where to 'attraction' is applied for to 'draw care'; the author of the treatise says 'draw care lay together.' But the philosophic use of the word is more conspicuous in Sir K. Digby's Treatise on Bodies, A.D. 1669, where it is said that wherever the first cause of the motion proceeds from that body towards which the motion is made, the effect is properly called attraction, which is illustrated by the case of fire and air, in which, though there is an intermediate cause assigned by himself—namely, that the fire rarefies the contiguous air, which therefore ascends, and the surrounding air rushes in to supply its place—the author the fact that the fire is the first cause of attraction; so that, in fact, they must assume a principle as to matter which they immediately proceed to oppose as to attraction. [See Berkley, Immaterialism.] Again, in
ATT

70

ATT

speak of the place where matter is, they assume that the boundary of impenetrability is the same as the boundary of cohesion, and therefore, unless altered by several circumstances unlikely. [See Reflexion.]

2. We have those who would substitute pure hypothetical causes, such as Newton declines entering into, to explain the phenomenon of attraction. One writer requires that the body itself should be composed of two distinct sets of particles, the one set of water, the other of some volatile fluid from which he thinks he deduces attraction; another is satisfied with an efflux and reflux of a fluid from and to the body, but he remains at a loss to explain the centrifugal forces: evidently confounding the nature of the two in a manner which could not have been done by any person who had read Newton. A third fills the whole universe with streams of matter which are always passing through each other, and in this view does not shall we observe, that, in their attempts to produce an explanation of the phenomenon, they admit the phenomenon itself, which is all that Newton contended for; but as their motto is that of the Templars, Samper fertur Leo, they must have Newton on the other side, which is done by making him the advocate of what we have called physical attraction.

3. We have those who leave out of view the main fact, that the weight of the same phenomena as they really are, and treat the result as hypothetical, as well as the principle. 'Let the idea,' says one writer, 'of particles of matter attracting each other be impressed upon the mind, and it will then dilute upon their mutual actions, calculate the density of substance composing them, and be applied at pleasure to empty space, and show in what manner their motions will be disturbed by the actions of each upon the other.' But it is here forgotten that the 'whirls' alluded to were not made at pleasure, but they were 'whirls' actually taking place which were examined, in order to see how they did whirl. Newton laid by his theory of attraction for years, as a forgotten thing, because he found that, with the received notions of the earth's magnitude, it would not give the motion of the moon as it was and is only when he received the more accurate measurement of Picard that he resumed his inquiry. Did he whirl his planets at pleasure?

4. Another class of objects cannot conceive how attraction acts, and therefore they reject it. This argument is wholly unanswerable, because it is impossible to see on what part of the subject it bears, or how it is shown to be unreasonable to admit nothing as proved, except what can be demonstrated absolutely by the senses. It is a mistake in logic in terms, can be rejected on this ground.

5. All the above objections have been at one time or other advanced by men of knowledge; there remains one class more, namely, that of men who, being ignorant of two or three of the six or seven fundamental principles, are not found in the heavens, on which they deny the truth of the principle. To this class, we are happy to say, personal asperity, and imputations of intentionally misleading others, have been for the most part atoned upon the supposed mistake is a confusion between the words velocity and force, being much the same as if they confounded the drops which are pouring into a cistern for the time being, with the whole body of rain in the cistern itself. We quote another instance. A certain traveller remarks that it cannot be that the sun attracts a planet, at the very time when the planet is flying off from it. 'What more could it do, if it were really repelled?' he does not see that the same argument applies to stone thrown up into the air; and moreover that what it could do more, if really repelled, would be to describe a curve instead of one always concave towards the centre of force. To those who have acquaintance with mechanics it is unnecessary to say anything upon such objections. To those who have not, we recommend, if they form an opinion upon this question, which it is now necessary they should do, to follow either those who have studied it, or those who have not, whichever they have found most advantageous in the common business of life.

The history of attraction, independently of that of astronomy, consists in some scattered hints upon the principle, to be found in writers of all ages, previous to the time of Newton, sometimes as a mere word expressive of an unknown cause, but always preserving a principle that like things must always move towards like.

Mention of something of the kind is found in Aristotle, Plata-"
"tian, (who held it as a very ancient opinion that the moon's centrifugal tendency was balanced by her weight), Locrius, and other ancient writers. Reoberval, Keplcr, Galilei, and others, revived the idea, but without deducing any phenomena, except that of the descent of falling bodies, which was explained by the same plan. Newton, by showing that the law of attraction must be the inverse square of the distance; but without any substantial reason. Huygens found the law of the centrifugal and centripetal forces of a body moving in a circle; and Hook described the principal phenomenon of the comet in 1682, and the centripetal forces by a law similar to that of Newton without deducing any of the heavenly motions. The story, therefore, of Newton's being led to the notion of attraction by the fall of an apple, is most probably incorrect; though his thoughts might have been turned in that direction, here, as in the case of the prismatic spectrum, our idea of Newton's power is enhanced by knowing the fact that the notion, and even the very law, had already been in such hands as those of the men we have mentioned. Newton was the first who showed that Kepler's laws [see Astronomy] were necessary, upon the supposition of an attraction inversely as the square of the distance; and impossible upon any other.

On the continent, the Cartesian doctrines generally prevailed; but, as early as 1722, Hevelius broached the question, in his Discourse on the Figure of the Stars, for the progress of the application of the principle since that time, see Astronomy.

ATTITUDE:-, from the Latin, means the set of rubbing together. For its effects, see Friction, Heat.

ATTWOOD, GEORGE, was born in 1745, took a distinguished degree at Cambridge in 1769, and afterwards became fellow and tutor of Trinity College in that university. He graduated M.A. in 1768 and was elected a fellow of his college in 1770, and died in 1807. He is known by his treatise On the Rectilinear Motion and Rotation of Bodies, Cambridge, 1784, which continued for some time to be much read in the university; by some papers in the Phil. Trans.; by his book On Newton's Laws of Motion, which was published in 1793, and is known by the name of Attwood's Machine, the principle of which merits some notice.

When a constant or uniform force acts upon a mass, it produces equal accelerations equally in all directions, the whole distances described are as the squares of the times; that is, whatever length is described in the first second, four times as much is described in the first two seconds, nine times as much in the first three, and so on. [See Akccl.] Thus the number of revolutions is doubled in taking the first second being called 1, that described during the second is 3, that during the third 5, and so on. Where the weight of a mass in the pressure applied, and the mass of only is moved, that is, where a body falls freely in empty space with a velocity proportional to the acceleration of gravity and the spaces described in successive seconds are 

16\frac{2}{3} \text{ feet, five times } 16\frac{5}{6} \text{ feet, etc.}, and these are distances too great on which to try experiments; and Attwood's method is a means of contriving systems which still move under constant forces of less amount, so that the spaces described during four or five seconds shall not require a very great fall. The principle made use of one which as well known in mechanics, namely, that if a pressure A, acting uniformly upon a mass B, produces a given acceleration during one second, it will only produce half that which would be acting on a mass twice as great. It is evident that only is moved, therefore, the mass times as much velocity in a mass half as great as B. A. Suppose, for instance, weights of six and seven times the weight of a stone were to have the same acceleration, would in 32 seconds, be 32 feet. But before this system can move, the 6 and 7 or 13 pounds must be stirred by one pound, and there will only be the 13th part of 32 feet of velocity produced in one second. Therefore, in the second, the heavy weight will fall only 14\frac{1}{2} \text{ feet: and in 32 seconds } 14\frac{1}{2} \times 32 = \text{ 32 feet.} And the velocity acquired may be reduced in any proportion, by making the weights more nearly equal.

Attwood's machine is a pulley, the points of which, instead of being placed in a block, are sustained on frictionless wheels (which see), to diminish the friction. Two weights
ATT

are hung over this by a string, and the mass moved consists of the two weights, the pulley and the friction wheels. But it is proved in mechanics that the effect, both of having the mass of the wheels to move, and of the friction, is a constant retarding force: for instance, in the preceding illustration, the machine might be so constructed that the effect should be to make the system move as if the larger weight were 64 pounds instead of 7, and the pulley were without density and friction. The velocity can be so far reduced as to render the resistance of the air insensible.

The length described in any time is measured by a vertical scale of feet, placed close to the line of motion of one of the weights. To measure the velocity acquired at any point, the moving pressure (the excess of one weight above the other) must be taken off, in order that there may be no fresh accession of velocity, or that the system may proceed only with the velocity acquired. This is effected by making the larger weight in two parts, one part equal to the smaller weight, and the other of course to the excess or moving pressure. The latter is so formed that it cannot pass through a certain ring, while the former can. By fixing this ring to any required point of the scale of feet, the moving pressure is taken off when the larger weight passes through it.

are hung over this by a string, and the mass moved consists of the two weights, the pulley and the friction wheels. But it is proved in mechanics that the effect, both of having the mass of the wheels to move, and of the friction, is a constant retarding force: for instance, in the preceding illustration, the machine might be so constructed that the effect should be to make the system move as if the larger weight were 64 pounds instead of 7, and the pulley were without density and friction. The velocity can be so far reduced as to render the resistance of the air insensible.

The length described in any time is measured by a vertical scale of feet, placed close to the line of motion of one of the weights. To measure the velocity acquired at any point, the moving pressure (the excess of one weight above the other) must be taken off, in order that there may be no fresh accession of velocity, or that the system may proceed only with the velocity acquired. This is effected by making the larger weight in two parts, one part equal to the smaller weight, and the other of course to the excess or moving pressure. The latter is so formed that it cannot pass through a certain ring, while the former can. By fixing this ring to any required point of the scale of feet, the moving pressure is taken off when the larger weight passes through it.

ATYA (Zoology), a genus of crustaceous animals, thus characterized by Leach:

Antennae, interior, furnished with two bristles, inserted in the same horizontal line; exterior, inserted below the interior, about the length of the body, furnished at the base with a great scale which is univalent, or one-toothed externally.

Pedipalpi external, the last joint shortest; flagrum elongated.

Feet. The two anterior pairs equal, penultimate joint shortest; last joint divided; tarsus equal, furnished at the apex with long cilia; third pair large, unequal, furnished with a very short nail; two posterior pairs furnished with a moderate-sized nail.

Tail, with the exterior lamella bipartite.

'It forms,' says Leach, 'a peculiar subdivision of the shrimp family, and one species only is known.'

ATYLU (Zoology), a genus of crustaceous animals, thus characterized by Leach:

Antennae composed of four joints, the last of which is formed of several minute articulations: upper ones rather shorter, with the second longer than the third joint; under ones with the second joint rather shorter than the third.

Eyes slightly prominent, inserted on a process between the upper and lower antennae.

Legs fourteen; first and second pair furnished with a small compressed hand, which has a movable thumb; the other pairs having only a simple claw.

Tail, on each side, with a triple series of double styles; upper part on each side armed with a small spine or style.

Body (including the head) composed of twelve joints.

Example—Atylus carinatus (Gommarus carinatus) Fabr.

AU, or AUB, is the termination of the names of many places in Germany. It signifies, in its restricted sense, meadow, but is often applied to the tract of level and fertile land on the side of a river, in which sense it is used in Scotland and the north of England, in the form of haugh, as in North-haugh, &c. It is also applied to the valley of a river, such as in Scotland is termed a cairn, as in the instance of the Wetter-au, or valley of the Wetter, a beautiful and fertile district in Hesse Darmstadt.

AUBAGNE, a small town in France, in the department of Bouches du Rhône. It is not far from the sea-coast, and on the road from Marseilles to Toulon, ten miles from the former place. The country around is pleasant. The trade of the town is chiefly in tiles and wine. Coal is found in
the neighbourhood. The inhabitants amounted, in 1864, to between 5000 and 6000. We have no authority of later date except the Ovide des Voyageurs of M. Reichard, which gives the population at 6000.

Before the Revolution, there was a majority of the order of St. Augustin; and the assembly of the states of Provence was sometimes held in Aups. Various antiquities have been found in the environs. (Dictionnaire Universel de la France.)

AUBAINE, the name of the pergriative by which the sovereigns of France formerly claimed the property of a stranger who died within their kingdom, not having been naturalized. It also extended to the property of a foreigner who had lodged within the kingdom and had not left an heir; as likewise to the succession to any remaining property of a person who had been invested with the privileges of a native subject, but who had quitted, and established himself in a foreign country. (See Merlin. Répertoire de Jurisprudence, tomo. i. p. 523.) It is called, in the French laws, the Droit d'Aubaine. Authors have varied in giving its etymology. Nieul (Thrésor de la Langue Françoise tant ancienne que moderne, fol. Paris, 1606) says it was anciently spelt Hobain, from the verb hobain to remove from a place to another. Cujiusus (Opere, fol. Nesp. 1758, tom. ix., col. 1719) derives the word from au aerne, a foreigner or stranger; and Du Cange (Glossar. v. Aubain) from Aups, the name of the mountain near the Seine, and the town of the native subjects. Ménage (Dict. Encycl., fol. Paris, 1694) says, some have derived the word from the Latin, alhit natus, a person born elsewhere, which seems the best explanation. (See also Walafrudis Sturlus. De Vit. S. Galli; l. ii. c. 47.)

This privilege of receiving the inheritance of a stranger upon their death was very ancient, and is mentioned, though obscurely, in one of the laws of Charlemagne, a.d. 813. (Capitul. Regum Francorum, curante P. de Chiniacus, fol. Paris, 1659.)

The Droit d'Aubaine was originally a seigniorial right in the provinces of France. Brussels, in his Nouv. Études de l'Usage général de Pfifs en France pendant le xii., le xiii., le xiv. siècle, 4to. Paris, 1737, tomo. ii. p. 376, has the express chapter, 'Des Aubaines,' in which he shows that the barons of France, more particularly in the twelfth century, exercised this right upon their lands. He especially instances Raoul, Comte de Vermandois, a.d. 1151.

Subsequently, however, it was annexed to the Crown even. It was, from the 14th century, subject to the exemption from it, by granting letters of naturalization.

Various edicts, declarations, and letters patent relating to the Droit d'Aubaine, between the years 1301 and 1789, are to be found in the Dictionnaire des Ordonnances du Louvre, tom. i., p. 610. In 1670, by a special edict of his own reign, Louis XIV. exempted from the operation of the Droit d'Aubaine those who had served in the army of France; and in 1674, by a similar edict, those who had served in the Flanders. Louis XV., in 1762, granted the same exemption to strangers dwelling in Toulouse; and Francis I., in 1533, to strangers residing in Dauphiné. Charles IX., in 1569, allowed exemption from it to merchant-strangers frequently the fairs at Lyons. Henry IV., in 1609, granted exemption to the subjects of the Republic of Genoa. Louis XIII., in 1632, restored the exemption only of the Duke of Lorraine. (Châlons, Droit de l'Aubaine, p. 1.)

Part of this right was claimed from the Droit d'Aubaine were frequently conventional, and formed clauses in treaties, which stipulated for reciprocal relief to the subjects of the contracting parties; these exemptions, it is probable, continued in force after the peace which the treaty had procured, and some were related to merchandise goods.

In the treaty of commerce between England and France, in 1668, the Jur Abbainés, as it is termed, was to be abolished as related to the English: 'qu'il et postumous alainnus fisco accidic non possint.' (Rynx. Text. tomo. xvi. p. 650.) Letters-patent of Louis XIV., in 1669, confirmed it in the parliament of Grenoble in 1674, excepted the Savoyards; and this exemption was confirmed by the treaty of Utrecht, 1713. The last and largest of the Cantons of Switzerland were excepted by treaty in 1713. The particulars of numerous other conventional treaties are recorded in M. Gauchon's work, in the speech of the Duc de Richelieu, in 1689, to which he was referred; and in the Marquis de Clermont Tonnere to the French Chamber of Peers, printed in the Moniteur for 1819, pp. 96-98.

Louis XV. granted exemptions, first to Denmark and Sweden; then, in the treaty called the 'Family Compact,' to the United Provinces and Hannover; in 1721, to the noblesse of Franche, Suabia, and the Upper and Lower Rhine; in 1769, to the Protestant Cantons of Switzerland; in 1771; and to Holland, in 1773. In Louis XVIth. reign, other treaties of the same kind were made with Saxony, Poland, Portugal, and the United States. The abolition of the Aubaine, as it related to Russia, was a distinct article of another treaty; and, finally, by letters-patent, dated January, 1787, its abolition was pronounced in favour of all the subjects of Great Britain.

The National Assembly, by laws dated August 6, 1790, and April 13, 1791 (confirmed by a constitutional act 3d of September, 1791,) abolished the Droit d'Aubaine entirely. It was nevertheless re-established in 1804. (Moniteur, 1804, tomo. v. p. 735.) In 1818, p. 672, the French Chamber of Peers confirmed the exemptions from the Aubaine as far as they were acknowledged in existing treaties. The final abolition of the Droit d'Aubaine, as already mentioned, was proposed by the Duc de Levis, April 14, 1818, and coming into effect in 1828. Foreigners now hold lands in France by as firm a tenure as native subjects.

The Droit d'Aubaine was occasionally relaxed, by the kindness of Prince, upon minor consideration. In the early part of the 14th century, an exemption was obtained by the University of Paris for its students, as an encouragement to their increasing numbers. Charles V. granted the privilege in 1534 to such Castilian mariners as wished to trade with France. Francis I. entered into a treaty with the merchants who traded to Niamas. The fairs of Champagne were encouraged in the same manner: and exemptions to traders were also granted by Charles VIII. and Louis XI. Francis I. granted the exemption to foreigners who served in the army of France. Henry IV. granted the exemption to those who worked or worked in the tapestry-looms. Louis XIV. extended the exemption to the particular manufacturers who worked at Beauvais and the Gobelins; then to the glass-manufacturers. Louis XV. extended the exemption to the kirchers, whose town he had acquired by purchase from England; and, lastly, to strangers settled at Marseilles, that city having become the entrepôt of products from the Levant.

Ambassadors and persons in their suite were not subject to the Droit d'Aubaine: nor did it affect persons accidentally passing through the country. Still it was no small degree to the French law that this barbarous custom should have so long remained among a people so highly civilized. Beaumarchais, in one of his own juridictions, who wrote as early as the fifteenth century, calls it 'un Droit hayneux.' (Somme Rural, fol. Lyon, 1500, fol. v.)

An extensive treaty on the Droit d'Aubaine has been already quoted in the works of Jean Bacquet, avocat de la Chambre, in 1727, to 1827, 5 vols. Mem. Droit d'Aubaine, at the end of M. Dupuy's Traite touchant les Droits du Roy très Christian, fol. Par. 1855; and the Coutumes du Ralliage de Fuiry en Perthes, par Estienne Durand, fol. Chilans, 1722, p. 234. But the whole curious and comprehensive view of this subject will be found in the Recueil Universel de Recits et de Jurisprudence, par M. Merlin, 4to. Paris, 1827, tom. ii. p. 583, art. Aubaine; tomo. viii. p. 416, art. Heritier. (Moniteur, 1818 and 1819 contain abstracts of the documents while the abolition was passing through the Chambers of Peers. See the latter year, pp. 314, 316, 406.)
The chief passes in the former year have already quoted.

AUBE, a river in France, which rises in the department of Haute Marne, in the range of hills which connects the Côte d'Or with the Voges. The waters of many of the tributaries of this river flow from the same range, as well as those of the Seine itself, the source of which is about 56 miles south-west of that of the Aube. The course of the two streams is for some distance nearly parallel, until the Aube, after flowing about 80 or 85 miles, turns gradually more to the south-west, and united with those of the Seine, near the little town of Romilly.

The whole length of the Aube is about 113 miles; and the distance in a straight line from its source to its junction with the Seine is about 87 miles. It does not receive any tributary of the first magnitude. The Seine falls into it on the right bank, and have a course of about 30 miles each, are the largest. The principal places by which it passes are La Ferté-sur-Aube, Clairvaux (once famed for a wealthy abbey), Bar-sur-Aube and Auvers-sur-Aube; at which last, about 22 miles above its junction with the Seine, it becomes navigable. (Malte Brun: Bru's Map of France.)

AUBE, a department in France, taking its name from the Aube river, by which it is traversed, and which is traversed in a direction nearly N.W. This department is bounded on the N. by that of Marne; on the E. by that of Haute Marne (Upper Marne); on the S. by those of Côte d'Or and Yonne (which last also bounds it on the S.W.); and on the W. by those of Meurthe-et-Moselle, Haute Marne, and Marne. E.S.E. to W.N.W., sixty-eight miles; and the breadth, measured at right angles to the above dimension, is fifty-six miles. The superficial contents are about 2334 English square miles; and the population (in 1826) was 442,000 persons, the number of exalted orinators.

This department, which corresponds to part of the former province of Champagne, has no mountains, nor any considerable elevations. The surface consists of undulating ridges, the Aube traversing it at several courses nearly parallel to each other: then turning more towards the W., they unite their waters near the N.W. extremity of the department. The Seine is navigable from Troyes, the capital of the department; and the Aube from Bar-sur-Aube to Auvers, the usual point of departure of the Rhine, Pindar, mathematicians, and magic, the latter with the resolution of never making use of it. At the breaking out of the third civil war he escaped from his guardian, who kept him close, and joined the Huguenot bands, which, in 1570, lived at free quarters.

When peace returned, love put poetry into his head, and awakened his scribbling propensities, but these again were put to flight by the massacre of St. Bartholomew. Soon afterwards he decided for the side of Navarre, whose future Henry the Fourth. Thus installed as protector, D'Aubigné rendered himself remarkable for his boldness, talent, cordiality, and pertinacity. He abounded in repartees—his hands were full of quarrels; he wrote a tragedy called Coré; and seems to have excited some admiration, but little friendship. As a partisan, however, D'Aubigné was a more favorable follower, and as such Henry of Navarre both prized and used him. When war broke out, D'Aubigné not only accompanied the armies, but shared in the personal adventures of the prince, some perilous, some ludicrous; for Henry was as fond of disguise and gallantry as of feats of arms. The king of Navarre had little to which to reward such service: he was pitifully poor, and D'Aubigné had neither the disinterestedness nor devotion of Sully. Consequently, when in the height of his favor with the prince to push his frankness to insolvency; he vented his discontent in sarcasms, and at least wore out the patience of the best-natured of kings and companions. In his private memoirs, D'Aubigné has eulogized his returns and his refusals to the prince, in his amours. He also mentions, that on his return from a perils and important expedition the monarch rewarded him merely with his picture; and he even goes so far as to say, that Henry was determined to get his hands on the Seine.
had made many bitter enemies by his sarcastic behaviour, and their influence again drove D' Aubigné from court. In order to be avenged, he determined to turn catholic, if possible—a resolve that he ingenuously avows; and he betook himself to the persual of the controversial writers of that party, among whom Bellarmin made most impression on him. By this effort, and studies was, however, to render him a firmer protestant than before. In this, he owns, Whitaker's Preflections had considerable influence. In 1587 we find D'Aubigné again in the service of Henry, and engaged in active controversies. In the following year he was rewarded with the government of Maillezais.

The possession of a fortress was at that time the great guarantee of independence. It instantly raised an officer to power, and gave a rank and grandeur. The acquisition of this great privilege was not likely to render so turbulent a personage as D'Aubigné more obsequious or mild. He was in a little time again at variance with Henry, embracing the party of the Huguenots, and openly professing their interests to court favour. Nevertheless, it was necessary to confide the Cardinal of Bourbon to a trusty guardian, Henry selected D'Aubigné, notwithstanding the exhibition of his counsellors, adding, that D'Aubigné's word was a sufficient guarantee for his faith.

From the period of Henry's desertion of protestantism, D'Aubigné was one of the firmest supports of the Huguenot interests, always representing them in their assembly, and carrying on a correspondence with the court. D'Aubigné asserts that the ruin of the Huguenots and the downfall of their cause were owing to the corruption of their chiefs, who for the most part received bribes or places and were thus induced to relax in opposition, in opposition to their principles. No one escaped this charge. He himself bore this charge. As to D'Aubigné, one thing is certain, that he might have been rich, like his comrades, and that he was almost the only one who remained poor. His estate having been raised for him by his friends against the insidious proposals of the court. On one occasion he conducted a controversy with Cardinal Du Perron, and engaged for the Huguenots that they would submit to what could be proved to have been the practice of the church for the first 400 years of Christ's existence as a form, more in addition, said the cardinal, willing to include the Chalcidenean Council. 'I will,' replied D'Aubigné. When expostulated with for his concessions, he answered, 'Does not the cardinal own by his demand of forty more years, that the traditions of the church were in variance with his propositions?' Numerous controversial tracts proceeded from his pen at this period. But the chief fruit of his residence at Maillezais was the History of his own country, a document presented to France. It has been compared to the work of De Thou, and even preferred to it. De Thou, however, wrote a history, and D'Aubigné a memoir, his work being a lively picture of passing events, facts of war, and intrigues of court, in which the observers of the personages at this period are cheeked by a satiric and lively pen. The Catholes did their utmost, first to prevent D'Aubigné from writing it, then to suppress it when written. The last volume was printed at Maillezais in 1616, and in the following year it was condemned by the Pope, and to his ban. The publication increased the hatred of the queen to D'Aubigné. The ministry had made frequent overtures to purchase the possession of his fortress; and when at last he found it no longer tenable, he sold the property, took the oath of the Huguenot party, and De Robe. Having thus closed his political career, D'Aubigné retired to Gonesse. He arrived there in September, 1626, and was most honourably received. He lived in exile ten years, during which he escaped his studies diligently; making the natural history and the antiquities of England, at the same time, his peculiar delight. Here he formed an acquaintance with Anthony à Wood, to whose collections for the history of the University and its writers he became a contributor (Life of Wood, p. 90; and, in 1628, to the Master of St. John's, Cambridge, then repairing by Dodsley and Duplex. In 1646 he became a member of the Middle Temple, but the death of his father, in 1652, prevented his pursuing the law as a profession. He was now so eminent a man, that he was chosen a member of the house of Commons, and in his Macclesfield he acquainted us that he had also a estate in Kent. In 1656 he became one of the club of commonwealth-men, formed on the principles of Harrington's Oceana, published in 1655. (See the author of Oceana.) says: 'These days and
government and of ordering a commonwealth were the most ingenuous and smart that ever were heard, for the arguments in the Parliament House were but flat to those. This grang,' he was a great deal that it was, and believed he could be carried, by way of tenantmen; which being not used or known in England before, upon this account the room every evening was very full.' The club however was broken up in 1639. In 1660 Mr. Aubrey went into the court; but his returns from the west was

September that year, he narrowly escaped shipwreck near Holyhead. (Mem. at supp. p. vi.) His notes inform us that he afterwards suffered another sort of shipwreck: he says, 'On November 15, 1661, I made my first address in an oratory.' (ibid.) That the volume of 1663, preserved is in the same; but from this remark we gather that in that state he enjoyed no great felicity. In 1663 he became a fellow of the Royal Society. In 1664 he was in France. His estates, between lawsuits and mismanagement, now became emaciated, and about 1666 he seems to have disposed of several: that at Easton was parted with in 1669 and 1670. (Mem. p. xii.) In the space of four years he was reduced not only to straits but to indigence. Yet his spirit remained unbroken. From 1670, he says, 'I thank God, I was allowed' It was a period of great felicity. This felicity in which he calls happy, consisted in following up the bent of his genius, while he owed his subsistence to the kindness of his friends; and in labouring to inform that world which in him, 'nurtured as a flower, and withered in the sun.' In 1673, the Lady Long, of Draycot, in Wiltshire, in whose house he had an apartment, and by whom he was generously supported as long as he lived. Dr. Rawlinson says (Mem. p. xii.) that he was on his return from London to Lady Long's house he was struck with such horror at the sight of the house, that it is presumed he was buried, though neither the time of his death nor his place of burial can yet be discovered. The writer of Aubrey's Life in the *Biographia Britannica* (vol. i. p. 349), conjectures that he died about 1700. Sir William Aubrey, of his Library, preserves a page from the *Biographiæ Britannicæ* preserved; as well as Gough's Brit. Topogr. i. 363; and Manning's Hist. of Suffolk, iii. 685, 686.

AUBURN, a town of Cayuga county, about 17 miles west of Ithaca, in New York. Auburn is favourably situated on the outlet of the Oswego Lake, a fine stream with falls and numerous mill-seats, offering facilities for manufacturing establishments, several of which have been formed here within the last few years. It is now a principal canal which the Oswego and Seneca passes close to the town, and contributes materially to its prosperity. The court-house for the county is situated in Auburn; the population of the town in 1833 was stated to amount to 4099. Auburn contains a theological seminary, which was established by the Presbyterians in 1831; it has four professors, a library of 4500 volumes, and (in 1833) fifty-four students.

This town is principally interesting as containing the first built of the two state prisons of New York, which have been erected upon the principle of the reformist in the reform of the prisoners, and have accordingly excised a considerable degree of attention. The principle adopted in the management of the prison at Auburn, is that of depriving the prisoners of social intercourse, and of permitting them to act as a corps of hired labour. The prison is so directed that the criminals are made not only to support themselves, but also to defray all the necessary outgoings of the prison. The outer wall of the prison incloses a space of ground 500 feet square. The principal building stands at the distance of 100 feet within this wall, and is three-sided, the front being 276 feet, and each of the sides 242 feet long. Besides the keepers' apartments, hospital, chapel, and domestic offices, the building contains 555 cells, capable of holding only one person, each of them being 7 feet long, 3½ wide, and 7 feet high. These cells are perfectly ventilated; they are arranged in five rows, or stories, opening into galleries, and are so managed that no communication can pass between the inmates of neighbouring cells, unknown to the officers of the prison. The space in front of the cells is so perfect a sounding gallery, that a person standing on the ground story can hear even a whisper from the most distant cell at the top.

The system now pursued in this prison is essentially different from that adopted when it was first opened in 1821. It was at that time intended to try the effect of constant solitary confinement in cells, and eighty hardened offenders were accordingly selected from other prisons for the experiment. This plan was abandoned in 1823, about the middle of which time it appeared to be attended with such serious effects on the health of the prisoners, some of whom had become insane, that it was necessarily modified. It might have been feared that the effects of such solitude as having proved thus injurious, the system of the whole would have been rejected, and the prison suffered to degenerate into an ordinary place of confinement, without further attempts at reforming the prisoners. Happily the idea was not abandoned that solitude might be made to exercise a beneficial influence upon the character of criminals, unimpeded by

L.2
It was conceived that this good effect might be attained by leaving the convicts in their solitary cells during the night, and compelling them to work during the day in society; but obliging them at the same time to preserve absolute silence. The infraction of this rule is followed by severe and immediate punishment inflicted by the keepers with a whip made of raw hide, and the punishment follows the offence, so that it is known as 'to be nearly as effective as being nearly a preventive, the application of the whip being sometimes not required for three months together.

All the operations in the prison are conducted with the greatest regularity. The convicts who have previously learnt their trade, are employed upon it; otherwise they are taught some new trade, and the keeper is allowed to select such an employment as appears best suited to their powers. The workshops are attached to the prison, and all of them vary according to the season. When the length of daylight will allow of it, the prisoners work twelve hours in the day; at other times they labour during the continuance of daylight. But when not absolutely at work or at their meals, the convicts are always in their cells, and the discipline of the prison is so strict, that not even a glance of recognition is at any time allowed to pass among the prisoners.

The severity of the system here described is such that it is difficult, in order to justify it, to show that it is productive of considerable benefits. In a report drawn up by commissioners appointed by the legislature of New York to visit this prison, we find the following passage descriptive of some of the advantages realised: 'The separate cells by the side of the prison presents a means of all contamination among the prisoners. By this system every prisoner forms a class by himself, and to all moral and social purposes he is insulated. The novice in crime may work for years by the side of the most expert felon, without making any progress in the sciences of crime; and the entire separation from all criminal associates, the sobriety of feelings consequent upon temperance and labour, and most of all, the sadness of solitude, must frequently make some impression'.

The religious instruction of the convicts is not neglected; there are prayers morning and evening. The only book permitted on the premises is the Bible, a copy of which is placed in every cell, and the chaplain of the prison is the only person with whom the convicts can hold unreserved communication.

The system pursued at this prison appears to have a favourable effect upon the health of the convicts. The mortality of the prison in Philadelphia is stated to be in the proportion of 1 to 16, while, at Auburn, it is in the proportion of 1 to 184. In the penitentiary at Wethersfield, the discipline of which is similar to that of the prison at Auburn, the proportion is 1 to 441, and in the prison at Auburn itself, the proportion is 1 to 16. Of the moral effect of the regulations, we may judge from the fact that, while in the prisons of Pennsylvania, 1 convict out of every 6 has been recommitted, and in the state of Maryland the commitments are as numerous as 1 in 7, the proportion of released criminals in the cells at Auburn is not greater than 1 in 19.

AUBUSSON, a town in France, in the department of Creuse, about twenty-three miles S. E. from Guéret, the capital of the department. It is situated on the River Creuse, and in the midst of a sterile district abounding with granite mountains and deserts, and is surrounded on all sides by well-built. The manufacture of carpets is the great support of Aubusson. Those made in the royal manufactories are equal to the carpets of Paris; and there are many others not inferior to the best of their kind. There is also made here. This is the capital of an arrondissement: it has a theatre, an agricultural society, and a nursery-garden for the department. The population is upwards of 4,900.

The circumference of Aubusson contains 860 square miles, or 540,400 acres, and has a population of 93,596 inhabitants. (Mallet-Brun; Balli; Dict. Univer. de la France.)

AUBUSSON, PIERRE D', was born in 1423 at a noble French family, descended from the old Vescovs of La Marche. He served while yet very young in the imperial army in Hungary against the Turks, and from that time the prevailing idea of his mind seems to have been that of fighting the Mussulmans, who then threatened to overpower Christian Europe. He was afterwards summoned to come to France, and was presented at court by his cousin Jean d'Aubusson, chamberlain of Charles VII., and became a favourite of the Dauphin, afterwards Louis XI., whom he accompanied in his expedition to Switzerland in 1444, and was present at the battle of Grandson on the 28th of February. He proceeded to Rhodes, when he entered the order of St. John of Jerusalem. He obtained a commandery, and was dispatched by the Grand Master with a mission to France, which he accomplished with success; and was an active ally of the Turks, who was then threatened by Mahomet II. He was afterwards made Grand Prior, and was intrusted with the care of the fortifications of Rhodes. In 1476, on the death of the Grand Master Orsini, d'Aubusson was renewed the attack in person. In May he died, a small town of Bithynia, in May, 1481. The Turkish success was decided between his two sons, Bajazet and Zizim; and the latter being worsted in fight, took refuge at Rhodes, where D'Aubusson received him with great honour, and after- wards sent him for safety to Bourganeuf, a commandery in France, where he remained till his death. He died in 1500, and was buried in the church of St. Peter at Rhodes, with the title of the Count of Rhodes. He was a cruel and most successful warrior, and was very rich in gold. He was the father of the famous hero, the grand master of the Knights of Rhodes. His name is perpetuated in the title of the Grand Master of the Order of St. John of Jerusalem. He was a man of great courage, and a most excellent commander. He was succeeded by his son, the grand master of the Order of St. John of Jerusalem.
AUCHERMUTRY, a royal burgh in the county of Fife, in Scotland, incorporated by James IV. of Scotland, and governed by three bailies and fifteen councillors. It has no share in parliamentary representation. The population of the parish amounted in 1831 to 3,223 persons, who are partly engaged in manufacturing brown linen. There are four fairs in the year, which are numerously attended. The cloth is abundant in the parish. The church was rebuilt, in a substantial manner, in 1760. The vestry is in the presbytery of Cupar and Synod of Fife. Auchtermuchty is distant about 9 miles west of Cupar, and 3½ north by west from Falkland.

AUCKLAND, ST. ANDREW, an extensive parochial chapelry in Darlington Ward, in the county of Durham. The name is derived from the Saxon Ac, or Ake (oak), and the word land, and in old writings is spelled Akeland, Auckland, Aclent, Aclat, and Acle. The parish contains twenty-seven subdivisions; parishioners, 291, of which only one calls for particular notice, viz. Bishop's Auckland. Some others may be here mentioned. Bishop is the site of a Roman station—Vinovium, or Binovium. The station is on elevated ground, nearly eighty feet above the level of Wear, which washes the base of the hill on the west. Various Roman antiquities have been discovered here: coins, fragments of pottery, seals, &c. At Thickleoy was born Colonel John Ladburne, who occupies a conspicuous place in the history of Charles I., and he has given the title of Earl to the late Lord Chancellor Eldon.

The parish of St. Andrew Auckland contains 44,470 acres (= 71 square miles), and had, in 1831, a total population of 1,249, and 137 inhabited houses. The town is chiefly noted for its Church, the largest in the county of Durham, and is crossed by a stately stone bridge, called Newton Capp Bridge, of two elliptical arches, according to some authorities (Hutchinson, History of Durham); or of one circular and one pointed arch, according to others (Beauties of England and Wales). The height of the bridge above the river, and the span of the arches (91 feet for one arch, and 101 feet for the other), are considerable for the time of its erection, which was about the year 1390.

The church is on the bank of the river Gaunless, a stream which, running through the parish, joins the Wear near Bishop's Auckland. It is in the form of a cross, and has a tower at the western end. It was collegiate in early times, before the time of Antony Beck, or Beke, bishop of Durham, who is commonly reputed to have been a collegiate in 1320. The college, as appointed by Bishop Beck, consisted of a dean and an unascertained number of prebendaries or canons. This church, on the dissolution which took place in the 1st of Edw. VI. a.d. 1547, was greatly reduced, being reduced to a chapel and several gardens. The site of the bridge, one of the most beautiful in the county, has been the subject of many anecdotes, and some have been attributed to its beauty only, which it continues still to be. It is in the archdeaconry and diocese of Durham, and the bishop is the patron. (Hutchinson's Hist. of the County of Durham; Beauties of England and Wales.)

AUCKLAND, BISHOP'S, a market-town and township in the parochial chapelry of St. Andrew Auckland, 2484 miles N.N.W. from London, and 10 miles S.W. from Durham.

It is situated on an eminence, bounded on the north by the river Wear, and on the east by the little stream, the Gaunless, which falls into the Wear near the town. It is on the old Roman road, Walling-street. The eminence on which it is built is nearly 140 feet above the level of the plain below, and the scenery, from the higher points, may be termed hanging gardens. The town is well built, and there is a spacious square market-place. A grammar-school was founded here by King James I. in the second year of his reign, at the petition of Dame Anne Sackville. The whole of the income from the school was endowed with an income of £10, annually. The school seems to have been further endowed by Bishop Neile; and it appears also that the old chapel was appropriated to its use by Bishop Morton of Durham in 1617, and even in 1627, and the latter from 1632 till the dissolution of the see in the time of the Commonwealth. In the course of the last century the chapel was rebuilt by subscription, and divine service restored. The school is now a grammar-school. There is a school for 80 boys, founded by Mr. Walton; also one on Dr. Bell's system, for 50 boys; and a school of industry for girls. The last two
The town derives its designation of Bishop's Aukland from the residence of the bishops of Durham. It is said to have been chosen as an episcopal residence by Bishop Antony Beck, mentioned in the charter of Charles the First, and contains a building in a very magnificent style; but there are no remains of it left. The present palace, which has lost all the appearance of a castle, and is an irregular pile rather resembling a magnificent abbey, lies at the N. end of the town. The entrance to it from the town through a neat Gothic gateway and screen, extending 310 feet. The palaces-chapel, which was built by Bishop Cosins, is a very fine edifice, with lofty piers and arches of the early English character. It is 84 feet in length and 48 broad. This chapel has been repaired at various times. The windows of the aisles are in the decorated style, and the east window is very fine. The altar-piece is a painting of the resurrection, by Sir Joshua Reynolds. Bishop Cosins lies buried under the floor. A plain stone, with a modest epitaph, probably called Cholmeley, bears his name. There are some poems, written by the same hand, to the memory of Bishop Trevor, who died in 1771. The palace contains some good paintings; among them are full-length portraits, by Ribera (otherwise Spagnoletto), of Jacob and the seven pieces of silver, and a picture of Cardinal Cammillo by Titian. There is also a portrait of Tycho Brahe, the Danish astronomer. The park (through which the Galloway flows) is very extensive, including 800 acres, and the part near the house is laid out so as to command a great variety of prospects. A stone bridge, built in 1626, crosses the river.

The episcopal palace was granted, on the overthrow of Charles I., and his party, and the suppression of the see, to Sir Arthur Haxley, who determined to make it his residence. He pulled down almost all the buildings which he found, and out of the materials of the former house. On the restoration of Charles II. the bishops came again into possession; but Bishop Cosins declined to occupy the house built by Sir Arthur, on the ground that he had used in building it the stone of the ancient chapel. He accordingly pulled it down, and restoring the stone to its original destination, built the present chapel.

(From Hutchinson's Hist. of the County of Durham; Beauties of England and Wales, &c.)

The auctioneers are employed for the sale of various descriptions of property. This practice originated with the Romans, who gave it the descriptive name of auction, an increase, because the property was sold to him who would offer most for it. In more modern times, a different method of carrying on the trade was introduced. The auctioneer's practice is equally, although not so correctly, applied. This latter method, which is called a Dutch auction, thus indicating the local origin of the practice, consists in the public offer of property at a price beyond its value, and then gradually lowering or diminishing the price until some one among the company consents to become the purchaser.

The first-described mode of sale by auction was established by the Romans in the disposal of captives, and was conducted cum hostilis, that is under a spear, which was thrust into the ground upon the occasion. This expression was continued, and sales were declared to be conducted cum hostilis long after the spear was dispensed with. In the same manner is the present day practice limited to sale by the candle, or 'by the inch of candle,' with as little regard to actual practice. The origin of this expression arose from the employment of candles as the means of marking the time. It was declared that no one lot of goods should continue to be offered to the fair description of the proposals, for a longer time than would suffice for the burning of one inch of candle; as soon as that rude kind of measure had waned to that extent, the then highest bidder was declared to have disposed of that lot.

It is a common rule in law that no contract is binding without the consent of both parties. In sales by auction, the consent of the buyer is given by means of his bidding, while the amount of the seller is signified by the fall of a hammer; and until this declaration has been made, the intending purchaser is not entitled to draw his bidding. It is a common practice for the owner of property offered for sale by auction to reserve to himself the privilege of bidding, and, as it is termed, buying in his goods, if the price offered by others should not suit his convenience. This practice was held by the civil law to be illegal, and even partake of the nature of a fraud; and so lately as the time of Lord Mansfield, private biddings at auctions were so considered. In the present day, however, they are not only allowed by the law, but the legislature has so far recognized the propriety of the practice, that the property has been bought in either by the proprietor or by his declared agent, who is in general the auctioneer, no auction duty is chargeable.

It has been said, that the buyer of goods at an auction cannot be held to the performance of his contract, in cases where he was the only bidder at the sale, and where public notice was not given of the intention of the owner of the goods to bid, even though his agent was present. He is held to be bound to a contract with the seller to act as a protection to the public against the practice commonly resorted to by disreputable auctioneers, of employing persons to make mock biddings with the view of raising the price by their apparent competition: the persons thus employed are generally called 'mark men' or 'mark boys,' and more especially in London, many persons make a trade of holding auctions of inferior and ill-made goods; persons called 'barkers' are generally placed by them at the door inviting strangers to enter, and pullers are always employed. These persons bid more than the标的 goods are worth, and thus entice the unwary. Many ineffectual attempts have been made to put a stop to these practices.

The auctioneer is considered the agent of both parties, vendors and purchasers. In the language of the judges in a previous case, 'a bidder, by his agent, has a right to a contract.' He confers an authority on the auctioneer to execute the contract on his behalf. He can therefore bind the parties by his signature according to the requisition of the Statute of Frauds, which renders it necessary in contracts of sale of bonds or similar description to be made in writing or delivered in goods above the value of 10l., that some note or memorandum should be signed by the parties or their agents lawfully authorized.

And such signature is now held sufficient even in an action for a breach of contract against the vendor in his own name. It has been doubted therefore whether a bidder may not retract (in cases within the statute) at any time before the actual written entry. The auctioneer also stands in the situation of a stakeholder of the deposed party, and is in the nature of damages for a breach of the original contract, in the same way as the part of the goods being sold. This peculiarity of his position it results that he is now (as settled by a case referred to in the notes) did not hold himself responsible to the vendor for any advantage which he may make from the money in his hands. In this respect his situation differs from that of a mere agent, and also from that of one of the contracting parties (the vendor), from whom interest is recoverable in the nature of damages for a breach of the original contract on the part of the vendor, by whose failure to make a good title the vendor has for a time lost the use of his money. — (Mr. Justice James Parks.) An auctioneer (like any other agent and trustee concerned in the sale of property) is bound to use the utmost diligence in the due discovery and description of the property, and to make a fair and open auction, without disclosing the name of his principal, an action which will be against himself for damages on the breach of contract.

The conditions of sale constitute the terms of the bargain, and purchasers are bound to take notice of them. The late Lord Ellenborough said, that 'a little more fairness on the part of auctioneers in framing particular would avoid many inconveniences. There is always either a suppression of the fair description of the property, or something stated which does not belong to it; and in favour of justice and considering how little knowledge the parties have of the thing sold, much more particularity and fairness might be expected.' The conditions usually contain a provision that in the event of error or mistake, the approbation of the purchaser shall be necessary, that an allowance shall be made for it in the purchase-money. But this clause is held only to guard against...
unconditional errors, and not to compel a purchaser to complete the contract if he has been grossly misled.

The duties levied upon goods sold by public auction are not charged according to any uniform scale. Sheep's wool of British growth sold for the benefit of the growers, or of persons who have purchased directly from the growers, is subject to an auction-duty of twopenny for every twenty shillings of the purchase-money. Freehold, copyhold, or leasehold estates, whether in land or buildings; shares in the joint stock of corporations or short-lived companies; reverse annuities, not in any of the public funds; and ships and vessels, are liable to pay the same amount for every twenty shillings: house furniture, pictures, books, and the like kinds of personal property, are made to pay one shilling for every twenty shillings of the purchase-money. Many exceptions have been made by the legislature when imposing these duties. Piece goods, wove or fabrics in this kingdom, which shall be sold entire in the piece or quantity, as taken from the loom, and is a law of the price of twenty pounds and upwards, are exempted from the payment of duty.

The produce of the whale and seal fisheries enjoys an equal exemption, as well as elephants' teeth, palm-oil, drugs, and other articles for the use of dyers; also manumaged and released slaves, and their descendants, and persons imported by way of merchandise from any British colony in America, the same being the growth, produce, or manufacture of such colony, and sold by the original importer within three months from the time of importation. In all these cases, duty is at any duty chargeable on goods sold by order of the courts of Chancery or Exchequer; or on any sale made by the East India or Hudson's Bay Company; or by order of the Commissioners of Customs, Excise, or other government boards of commissioners. In like manner, goods made by the sheriff for the benefit of creditors in execution of judgments, and bankrupts' effects sold by assignees, are not liable to the payment of auction-duty; which last exception of exemptions are made upon the principle of not aggravating the loss of judgment or bankruptcy, and for the same reason, goods damaged by fire, or wrecked or stranded, which are sold for the benefit of insurers, are not charged with duty. Wood, es太平, the produce of mines or quarries, cattle, corn, stock or produce of land, may be sold by auction free of duty while they continue on the lands producing the same.

In case the sale of an estate be declared void, through defect of title, the duty that has been paid may be claimed again within three months after the time when the defect has been discovered.

The value of goods subject to duty which have been sold by auction, and the net revenue derived from the same in each of the last ten years, are as follows:

<table>

AUCTEUR, a person whose profession or business it is to conduct sales by auction. It is his duty, previously to the commencement of every sale, to state the conditions under which the goods are offered; to receive and note down the respective biddings, and to declare the termination of the sale: for this purpose, he commonly makes use of a hammer, upon the falling of which the biddings are echoed.

The law holds that an auctioneer is authorized by the highest bidder or purchaser to sign for him the contract of sale, and that his writing down in his book the name of such purchaser, shall be sufficient to bind the latter to the purchase, provided no objection be made by him previous to his signing the contract. The law also authorizes the auctioneer to act as the agent of persons wishing to purchase, who may instruct him to make biddings for them. The auctioneer then being the agent of both parties, his signature of the buyer's name in the catalogue to which the conditions of sale are annexed, opposite to the lot purchased, together with the price bid, has been considered a sufficient note or memorandum in writing of the bargain within the Statutes of Frauds; but where the conditions of sale are not annexed to the catalogue, nor expressly referred to by it, the signature of the buyer's name in the catalogue is not a compliance with the statutes.

Every person acting as an auctioneer in the United Kingdom is required to take out a license, which must be renewed on the 5th of July in every year, and for this license the charge of five pounds is annually made. He must also register his name in a list of committee of officers of excise, within a certain period, a true and particular account of every sale held by him, and to pay the amount of auction-duty accruing thereon. For this purpose twenty-eight days are allowed, within the limits of the chief office of excise in London, and six weeks beyond those limits.

An auctioneer intending to hold a sale within the limits of the chief office of excise in London must give two days' notice thereof at the said office, and if the sale is to be held beyond those limits, three days' notice must be given to the collector of excise, at the nearest excise-office. This notice must be in writing, and signed by the auctioneer, and must specify the particular day when such sale is to be held. It must also state the name of the person by whom the sale is to be managed; whether printed catalogue, likewise attested by his signature, or by that of his authorized clerk, enumerating every lot and articles intended to be offered at such auction. He is liable for the law of the amount of the auction-duty, but may recover the same from the excise-officer. It is provided that the buyer shall pay the amount of duty in addition to the same bid by him.

If an auctioneer declines or refuses at the time of sale to purchase the articles, he at once offers to the buyers all matters in regard to which the responsibility would otherwise lie with the owner of the property sold. He is also responsible to his employer for any loss or damage that may be sustained through his negligence or want of attention. And if by his gross negligence the sale becomes nugatory, he can recover no remuneration for his services from his employer. If he receives money as a deposit on the sale of an estate, and knowing that there is a defect in the title, declines depositing the amount of the deposit with the amount to the purchaser; and if he pay over the produce of a sale to his employer after receiving notice that the goods of right belong to another, the real owner may recover the value from the auctioneer as well as from his employer.

The number of auctioneers' licenses issued in England during each of the last ten years was as follows: 1824, 2539; 1825, 2941; 1826, 2910; 1827, 2861; 1828, 3119; 1829, 2978; 1830, 3843; 1831, 2974; 1832, 3002; 1833, 3000.

AUCUBA, the Japanese name of a dicotyledon plant, now commonly cultivated in the gardens of this country as a hardy evergreen shrub, remarkable for its shining pale-green leaves mottled with yellow. It is described by Thunberg as growing to the height of a man or higher, but common in various places in Japan, both wild and cultivated. Its fruit, which it bears in March, is a red berry, about the size of that of a laurel, and containing a single stone, with a bitter nauseous kernel. In this country we have only the female state of this plant, the natural order of which is still unsettled. Several opinions upon that subject have been advanced by botanists, but Professor Derandelle seems most correct in referring it to the dogwood tribe (Cornuera), to which its strong smell of elder seems to point out its affinity.

It is said that only one species exists, namely, the aucuba japone of our gardens; but it seems not improbable, from Thunberg's figure, that the plant represented at his tab. 18. page 103, 13th ed., is an hybrids between two species. We possess only a variegated variety of the plant; in its natural state it is said to have brownish-green leaves without any blotches.

AUD, a river in the south of France, which rises in the Pyrenees, and falls into the Mediterranean Sea. Its source is in the department of Pyrenees Orientales (Eastern Pyrenees), a few miles N.W. of the town of Mont Louis. Its course is winding, though the general direction of it is from S. to N., past the towns of Banyuls, Ales, and Limoux, and through Aud. From Cassargues, this stream, though still winding, is for the most part towards the E., until it
empties itself into the sea near the Etang de Vendeure, to the E. of Narbonne, running nearly parallel with the great canal of Languedoc. Its whole course is from 130 to 140 miles.

The waters of the Aude are very turbid; and the deposits at its mouth have caused a considerable variation in the line of land and sea, which is followed into the sea; but the canal Robine d'Aude, or Robine de Narbonne, has taken the place of one of these. This passes between the Etangs of Sigean and Grui, and then through the Etang de Faugues, to the E. The banks of the river are on this side, except quite in the lower part of its course. It has no tributary of any consequence; the Orb, the principal, falls into it on the right bank about twenty miles from its mouth, is forty to fifty feet wide, and about 200 miles long.

The mouth of the Aude is shared by two estuaries, one closed by Mont Espinouse and the Black Mountains, which are part of the chain of the Cevennes, and by the eastern extremity of the Pyrenees. (Marte-Brune; Encyclopédie Méthodique, &c.)

The Aude was known to the Romans by the name of Atax. They gave this name to the channel which passes by Narbonne to the sea. That part of this channel which passes through the Etang de Sigean was deepened, and faced, and paved with stone. It is called the Aude du Bas in France, taking its name from the river Aude, which flows through it. It is bounded on the N. by the departments of Herault and Tart, on the N.W. by that of Haute Garonne (Upper Garonne), on the W. by the departments of Ariege, and on the W.S.W. by the Pyrenees Orientales. The east side is washed by the Mediterranean Sea. Its greatest length is in a direction nearly E. and W., and is about seventeen miles; and its greatest breadth is about fifty-seven miles. The superficial content is in the surface of the sea, 143,000,000,000; and the water of the sea, 142,000,000,000, giving about 109 inhabitants to every square mile.

This department consists of the basin of the Aude, and the slopes of the mountains by which it is bounded. The N. and S. were divided by the Aude, which forms the principal affluent of the river, and it serves as the boundary between the departments of Herault and Tart, and between the departments of Ariege and Haute Garonne. The course of the Aude is in a direction about S. by E. till it almost joins the Aude near Carcassonne, and then runs parallel to the course of the river for many miles, until, again turning a little to the north of S., the canal quits this department for that of Herault, and the river pursues its course towards the sea.

The mountainous districts are dry and unfruitful, yet the agricultural produce of the department is more than sufficient for the wants of the inhabitants. The vine is cultivated to a considerable extent; the figo is excellent; and an herd of domestic buffalo, which are exposed to the sun all day, is dried, and sent to other departments, or to Italy, to be used in the manufacture of glass. Honey, known by the designation of Narbonne honey, forms an article of considerable importance. Wheat and oats are abundant. The department is not great; though silver, copper, lead, and iron are procured, as well as marble in great variety, gypsum, and several coal; and there are salt-works near the Etang (of Foul) of Sigean, one of the lagoons which line the French part of the Mediterranean coast. At Bize is a cavern, in which human bones are said to have been found along with those of the stag, camel, reebuck, antelope, and bear.

The inhabitants carry on considerable manufactures, which are promoted by the advantage of inland navigation through the canal of Languedoc. Woollen cloth may be regarded as the staple manufacture. It is carried on at Carcassonne and Castelnau-d'Asp, by which towns are on the canal, and a furious trade is carried on. The flax and hemp, and glass, are among the productions of the industry of this department. The iron-works also are of some importance.

The little town of St. Colomb sur I' Heres (with a population of about 1000) is noted for its tannery and torgo.

Carcassonne is the capital of the department (population 18,000), Castelnau-d'Asp, and Narbonne (population each 10,000), and Limoux (population 7000). These are all chief places of residuum.

St. Colomb sur I' Heres is 16 miles from the place, 10 of the inhabitants, has 15 inhabitants.

The Carcassonne, Castelnau-d'Asp, Limoux, and Narbonne.

This department, which coincides with part of the province of Languedoc, is under the jurisdiction of the Court of Aragon (Assey Court) of Montpellier. It sends four deputies to the Chamber. It forms the diocese of Carcassonne, the bishop of which is a suffragan of the Archbishop of Toulouse and Narbonne. (Marte-Brune; Balbi; Dictionnaire Universel de la France.)

AUDUBONT, JEAN BAPTISTE, was born in 1759, at Rochefort, in France. His father was a dealer in provisions for the supply of the shipping. Young Audubont, at the age of seven, went to Paris to study the arts of design and painting. He soon excelled as a miniature-painter, and supported himself honourably by his labours in this way. Fortunately, in 1783, M. Gigot d'Orey, receiver-general of taxes, who was distinguished by his taste for natural history, employed him in the works on the classification of the birds of France, and gave him the fruit of his researches. This led to an extension of his labours in this direction, and he became the most munificent encouragement and assistance, having had an opportunity of judging of the talents of Audubont, employing him to paint the most rare objects in his magnificent collection, and afterwards sent him to England, Poland, whence he brought back a great many drawings, which were used in Olivier's Histoire des Insectes. These occupations gave a bias to Audubont in favour of natural history, which soon amounted to an ardent passion. No longer content to paint at the request of his employers, he published his most important works. The first of these was Histoire Naturelle des Singes, des Mammifères, and des Gépáchiniques, one vol. large folio, with sixty-two plates, the figures coloured, Paris, 1803. The appearance of this work caused a great sensation in the botanic world. Audubont's loves for the characters of painter, engraver, and author. Having carefully investigated the different modes of engraving, and the trials which had previously been made to colour the engravings of objects of natural history, he improved upon them, and made so much use of oil instead of water colours. He also succeeded in printing with gold, the colours of which he varied in such a manner as to imitate the most brilliant hues of the originals. In his Histoire des Colibris, des Oiseaux-Mouches, et des Oiseaux-Mouches, 1 vol. large folio, Paris, 1815, the expression and position of the birds are so perfect as to make them appear animated; and the descriptions, of which he is likewise the writer, are worthy of such a work. Two hundred copies only were printed in folio, in which the title was printed in gold; and one hundred and one hundred copies in large quarto; and only fifteen copies in folio, of which the whole text is printed in gold.

Seemingly were these works commenced before Audubont began to plan others—the history of Birds, of the Mammi-

The publishers, M. Desray, who was in possession of his materials and the processes which he had discovered, employed, and employed, these two works in a perfect manner as those which had been finished by the author himself. The text was edited by M. Vanriet, a naturalist, and friend of Audubont. These two works are united under the common title of Oeuvres D'or et de raffine metaliques, 2 vols. in large folio and large quarto, Paris, 1812. Upon the same plan, and by the adoption of the same processes, M. Vieillot, edited the Oeuvres de l'Amérique Septentrionale. The Birds of Africa (Les Oiseaux d'Afrique) de Le Vaillant are indebted for their excellence to Audubont, who, having undertaken the printing of the plates, added this part. Other branches of natural history, and especially entomology, were equally benefited by the discoveries of Audubont, as may be seen in the splendid works Le Jardin de Malmaison, by Ventenat, and the Ligue des Redoutés.
AUDIANS. [See HERETICS.]

AUDITOR, an officer or agent of the king, or of a private person, who examines periodically the accounts of under-officers, tenants, stewards, or bailiffs, and reports the state of their accounts to his principal.

Auditors of the impost.—Ancient officers of the exchequer who were responsible for the examination and approval of accounts. They were public officers originally established by the 25 Geo. III. c. 59, in place of the various offices of auditor of the impost (Lord Speaker's Office) to ensure that those charged with the task were adequately compensated for their duties.

The King is authorized by the statute of 46 Geo. III. c. 141 to appoint ten of these auditors, who hold their offices during good behavior with salaries of £1500. In 1805, the salaries were increased to £3000 per annum for the auditors and £1500 per annum for the other commissioners.

They are incapacitated from sitting in parliament, and are sworn to execute the duties of their office faithfully and impartially. There is a provision in the statute, that no vacancy which may arise by death or otherwise in the number of commissioners after the first appointment shall be filled up without the express authority of parliament, until the number is reduced to five, in which case the King may appoint five new auditors in addition to those who may have been appointed by the act of 1805, to keep their numbers always to six.

By the 46 Geo. III. c. 141, sec. 8, all public accountants are to transmit to the commissioners within three months after 31st December, or within three months of such day as the lords of the treasury shall order (see 2 & 3 Will. IV. c. 121), all sums received and paid to them by the public service, within the preceding year, together with proper vouchers for such receipts and payments, and a schedule of the names of all persons to whom money is due, and who are entitled to payment, by an officer in the audit office.

The commissioners may call on all public accountants, whenever they think fit, to account to them for the receipt, expenditure, or issue of all monies or stores entrusted to them, and on failure they are to certify the defaulters' names to the remembrancer of the exchequer, and the attorney-general of England or Ireland, and lord-advocate of Scotland, in order that proceedings may be taken to compel them to account, unless, on the defaulters' representations, the lords of the treasury think it proper to stay the proceedings.

By the 46 Geo. III. c. 121, it is enacted that at the four-quarter days, the fifth day of January, fifth day of April, fifth day of July, and the tenth day of October, general impress certificates are to be transmitted by the exchequer officers to each and every quarter, and vouchers for such certificates and the accounts of all monies and materials issued at the receipt of the exchequer within the preceding quarter, and these certificates are transmitted to the commissioners of audit within thirty days after each quarter day, and by the 10th section of the 46 Geo. III. c. 141, the paymaster of the forces, the treasurers of the navy and ordnance, and all other public officers, who issue to any persons money for public services by way of impress or on account, are required within three months after the 31st December in every year (or at shorter periods if ordered by the lords of the treasury, see 1 & 2 Geo. IV. c. 121, sec. 6.) to transmit to the commissioners of audit a certificate of such monies, with the names of the persons to whom paid, and the commissioners are forthwith to take them into commission.

Various regulations have been made respecting the mode of conducting the business of the commissioners of audit, by which the antient and inconvenient system of keeping the public accounts has been superceded.

The whole of the arrangements in the Audit Office are now subjected to the control of the lords of the treasury, who are authorized to make such orders and regulations for conducting the business of the office as they may think expedient, and it is enacted that the accounts of the duties of the commissioners and other officers. By the 2 Will. IV. c. 24, the above commissioners are authorized to audit the accounts of receipt and expenditure of the colonial revenues; and the 2 and 3 Will. IV. c. 95, transfers the accounts of the commissioners of audit in Ireland to the commissioners for auditing the public accounts of Great Britain.

AUDRAN, GERARD. This eminent engraver was born at Lyons, A.D. 1640. He learned the principles of design and drawing from his father, an artist. At an early age he went to Paris, where his talents soon obtained notice, and procured him eventually the patronage of Le Brun, the king's painter, who employed him to engrave the Battle of Constantine, and the Triumph of that emperor. He went abroad at an early age, and lived sixty years. His reputation perhaps rests chiefly on the celebrated series of plates after Le Brun's Battles of Alexander, respecting which the painter himself confessed that his expectations had been surpassed. It is indeed impossible to contemplate, without the highest admiration, the style of this engraving, which, notwithstanding the very great length of his burin throughout those immense and intricate compositions, is so admirably composed and executed, as to entirely free from manner, that, on looking at his prints, we lose sight of the engraver, and are reminded only of the master whom he is transcribing. To feel the truth of this remark, it is necessary to consider the circumstances of the above-mentioned Battles of Alexander, after Le Brun; The Preservation of the young Pyrrhus, after Nicholas Poussin; The Plague, after Mignard; and the Martyrdom of St. Laurence, after Le Sueur; in which works the respective style of each painter is rendered with the most distinct yet delicate discrimination. Gerard Audran owed his extraordinary excellence not only to his consummate skill in design, but in a great measure to his frequent habit of painting from nature; and several subjects which he engraved from his own designs attest the extent and versatility of his powers.

The works of Gerard Audran may be classified under four heads, exclusive of his portraits:

1. His slight prints or etchings, to which little or nothing was done, which among these may be enumerated—The Deluge, from Le Sage; The Passage through the Red Sea, from the same; the Combat of Joshua against the Amalekites, from the same; the Empire of Flora, from Poussin; the Preservation of Pyrrhus, from the same; a Ceiling, from Le Brun, representing the Seasons, in five plates, and dedicated to Louis XIV.

2. Those which are more finished, but in a rough, bold manner. For example: Paul and Barnabas at Lystra, from the tapestries in the Vatican; Raffaello; Coriolanus appealed by his Family, from Poussin; Time supporting Truth, from the same; the ceiling of the Chapel de Saulx, representing the accomplishment of the old law by the new, engraved in 1681, from Le Brun, on six large plates representing the six days of creation; The Agony in the Garden; The Death of St. Francis, from Annibale Caracci.

3. Those in his most finished manner, as the Battles of Alexander, from Le Brun; The Battle of the Granicus; The Battle of Arbela; Forus brought to Alexander. To this set are added two more large prints, as follows:—Alexander entering the Tent of Darius, and the Triumphal Entry of Alexander into Babylon. In both these works he has the name of Goyton, printer, marked on them. The Plague, from Peter Mignard; the Baptism of the Pharisées, from N. Poussin; the Martyrdom of St. Laurence, from Eustace Le Sueur; the Martyrdom of Agrippina, from Domenico.

4. Such as he did with the graver only; these are few, and perhaps unequal in merit to the preceding. We need only mention Aéses saving his father Anchises from the
plunder of Troy, after Dominichino; a small folio frontispiece to the epistles of the popes and cardinals, published at Rome, from Cyrò Ferri.

A few only of his works are here enumerated. This catalogue is from Strutt’s Book. Dict. of Gravers.

AURÉSTADT, a village of about twelve hundred inhabitants, in the canton of Zürich, about twelve miles to the north-east of Zürich, which owes its celebrity to the defeat of the main body of the Prussian army by a division of the French army under Marshal Desaix, on the 14th of Oct. 1796. By the brilliancy of the victory, General Desaix received the title of Duke of Auréstadt from Napoleon. On the same day Napoleon defeated Prince Hohenlohe at Jena; the two battles usually have gone under the name of the ‘Battle of Jena,’ as part of the same field, though they were not contiguous.

AUGER, ATHANASE, was born at Paris in 1734. Having entered the clerical profession, and taken orders, he applied himself indefatigably to the study of the Greek and Roman writers, especially the orators. He was appointed professor of rhetoric in the college of Rouen. The bishop of Lescaz had become acquainted with him, made him his grand vicar, and used to call him jestingly his vicar in patria. Athenaeum, alluding to his Greek erudition, for the public press. A translation was a publication of a Demosthenes and Aeschinés. 5 vols. 8vo. 1777. This was the first French translation of all the works of those two great orators, and Auger enriched it with treatises on the juridical system and the laws of the Athenians to one another. The republics, which now settled at Paris, where he lived in modest seclusion upon a small income, entirely devoted to his favourite studies. After the publication of his translation he was elected a member of the Academy of France, and his next works were a translation of Isocrates, 3 vols. 8vo. 1784, and one of Lykidas, 8vo., same year. He applied with equal zeal to the study of the great Roman orator, and translated the whole of his Orations, of which he had been a collector. He wrote at the same time a work on the constitution of Rome: De la Constitution de Rome sous les Rois, and Le Temps de la République, which was published after his death as an introduction to the whole of his life of Art. of 1798. 4. The essay on the Roman constitution fills the first volume, and as an abridgment it may even now be consulted with profit, although it has been in some measure superseded by Nieburh’s more elaborate and more profound work on the history of Rome. Auger’s object was to develop the system and the working of the Roman political institutions in their three essential parts—the legislative, the executive, and the judiciary. The second volume is a continuation of the first, being engrossed by a life of Cicero, chiefly relating to his political character, and containing the constitution of the state and the principal institutions of the Roman republic at the epoch preceding its fall. The study of Cicero and of Roman history occupied, in great measure, the last thirty years of Auger’s life. He worked in the mean time, selections from the works of the two Greek fathers, Chrysostom and Basil, Homilies, Discourses, and Letters chrestes de St. Jean Chrystostom, 4 vols. 8vo. 1785; and Homilies and Letters chrestes de St. Basile le Grand, 8vo. 1788.

The first symptoms of the French revolution found Auger deeply engaged in his meditations on the Greek and Roman republics. He felt naturally favourable to the general principles of constitutional liberty which were then professed in France, and wrote several pamphlets in favour of them. One of them seems to have attracted his attention at the time, was that of a new system of public education. In his Project d’Édu- cation Publique, Préliminaire aux Réflexions sur l’Assem- bleé Nationale, 8vo. 1789, he traced the outlines of two distinct plans: one for learned or classical education; another for the education of those who, not being able or not wishing to study Latin and Greek, might yet be desirous of being instructed in the literature of their own country, and of the customs and manners of their native language. In a subsequent little work, L’Agriculture du Coyen Français, 8vo. 1791, he reverted to the subject of education, observing, that his former plan being intended for the middle classes, there still remained a much more numerous class, consisting of the number of the towns-people and the rural population, for whom he had sketched out the present scheme. * It may have been deemed advantageous, he observes, * under the former system of government, to keep this vast multitude in ignorance, but such a state of ignorance becomes dangerous now. This class, with the knowledge of its strength, ought also to acquire the knowledge of how to use that strength without abusing it—it ought to be told its duties as well as its rights—it ought to be taught how to be instructed, and orderly, and moral. In his catechism be clearly defines the rights and the duties of individuals under a system of well-understood liberty; and he draws the line between liberty and the licence of vice—between that pure equality of rights, which is inherent in the nature of men. That line, however, was soon after obliterated, and the consequences were fatal to France and to Europe; but the good Auger was spared to see the catastrophe: he died in 1793. He was born in 1722, and died in 1793, in the year of the Convention, in which he had been a delegate.

AUGEREAU, PIERRÉ FRANCOIS CHARLES, Duke of Castiglione and Marshal of France, was born of noble parentage in the province of Burgundy. He entered the French army in 1767, and was in 1793, the last year of his life, the subject of the following notice, which was written by Adolphe de Seze, who afterwards figured as a member of the Convention, and who had studied Greek under Auger, composed his funeral eulogy. Auger was a man of great learning, in the simplicity of a scholar. His last treatise on Greek tragedy, was published a few days after his death.

was unable to effect the passage over the bridge, but still he was rewarded by a decree of the Directory, granting to him, in commemoration of his bravery, the standard that he had borne on the occasion. [See ASCOLI.]

In the following year, 1797, the attention and interest of the French army were withdrawn from the foreign enemy, and the Directory were more concerned with the troubles at home. The Directory was managed by the Royalists, as well as in a great measure by the friends of constitutional government, who now began to rally to the cause of the Directory in the name of the republic, under the semblance of the Directory. But this party, amongst other injurious acts, committed the great mistake of making the armies hostile to it. Bonaparte was accused for his conduct towards Venice, and was treated as an accomplice of the Directory. This caused the Directory to detach him from his regiment and by sending addresses from his soldiery in favour of republicanism. In the camp of the army of Italy Augereau was so loud in his exclamations of royalty, and so extreme in his revolutionary sentiments, that Bonaparte, at once took his part for him, and to provide the Directory with a useful agent, sent him to Paris. Here he continued his tone of vaunting and violence amidst the feasts and honours with which he was welcomed, and he was soon named military commissary, which was a second triumph. This nomination was enough to warn the opposition that the Directory meditated violent measures, and they accordingly endeavoured to obtain the dismissal of Augereau. The coup d'état, or revolution of Fructidor, was planned by Barère and Suchet, and supported by the generals, and the legislative body was driven from its post; the Tuileries, where the assembly sat was invested; the members hostile to the Directory were seized; and a most infamous act of cruelty and injustice was consummated with the utmost skill and success.

Augereau was rewarded for this important service by the Directory, as the command in the army on the German frontier. Here he surrounded himself with the most furious Jacobins, and discoursed of war. However, his principal object was to deprive him of the command, and remove him to Perpignan. Augereau found his way to Paris, and was there on Bonaparte's return from Egypt. It is much to Augereau's honour that, discontented as he was with the Directory, and restless as he had been, he went to Augereau, the latter could not count upon his assistance in the revolution of the 18th Brumaire. Bertrandt and Augereau were the only generals whom Bonaparte dared not summon to his sale. Augereau was at St. Cloud; for he had been elected deputy to the Cents, and anxiously hoped that the representative body and the republic would triumph over the military usurper. While the rest of the struggle was doubtful, he approached Bonaparte and said, 'Well, you see, one is in the minority.' Augereau rejoined Bonaparte, 'remember Arcole; my fortune seemed more desperate there; yet I retrieved it then, and shall not now.' He was right; the usurpation was completed, and Bonaparte the victor. 

Bonaparte distrusted his old comrade too much to appoint him again to the army of Italy. During the campaign of Marengo, Augereau commanded a division, for the most part Dutch, on the Lower Rhine, where he had hard fighting and little glory. After the treaty of Lavedan, he retired to a property which he had been enabled to purchase near Melun. He was intrusted with no important employment until 1803, when, with the new dignity of Marshal, he took the field against the German army which possessed the Voralberg. In 1805 he was engaged in the battle of Jena, and commanded the division which subsequendy took possession of Berlin. The terrible winter campaign which ensued undermined the health, but added to the glory, of Augereau. In the advance through Poland, he was frequently engaged, and commanded the left of the French at Eylau. His division, which was ordered to attack the centre of the Russians, advanced for that purpose, when a thick shower of snow covered both armies, and Augereau modestly exclaimed, 'as a result of Napoleon's plan, but his fault was remedied by the quickness of his commander, as well as by his own courage; though sickened by sudden illness and fever, Augereau had the energy to command. His division remained to the last in the action, though he was wounded. After the battle of Eylau, he was obliged to retire for the recovery of his health. In the years 1809 and 1810, he commanded in Catalonia, where he showed but little mercy to the Spaniards. Considering Augereau as a better general, Napoleon, instead of taking him to Russia in 1812, left him to form a corps of reserve at Berlin. But here the Cossacks found him in 1813, and it was with some difficulty that he was rescued by Napoleon's journey. Augereau took part in the campaign of Saxony, and made a valiant stand near Leipzig, defending a wood against superior forces. In 1814 he was intrusted with the defense of France against the Austrians, when he ocuemed Lyons, and organized its defenses. At first he repulsed them in several combats; but at length, aware of their prodigious superiority of force, as well as of the diminishing resources of Napoleon, he made a capitulation and retired to his own lines. Napoleon considered his conduct on this occasion as little short of treachery; and it is certain that, of all the Marshals, Augereau was the least attached to a master who was so much his junior, and who, by his usurpation, had blasted the ambition of the republican general. Augereau made his peace with the Bourbons, was confirmed in his dignities, and created a peer. On the return of Napoleon in 1815, Augereau kept aloof. Louis XVIII. in 1814, Augereau who considered the painful task was imposed upon him of being one of the council to try Marshal Ney. His vote of condemnation on his brother soldier is the greatest blot upon Augereau's memory in the eyes of the French. He did not long survive, being brought to the grave by the grief of his family and the legislative body was driven from its post; the Tuileries, where the assembly sat was invested; the members hostile to the Directory were seized; and a most infamous act of cruelty and injustice was consummated with the utmost skill and success.

Augereau was rewarded for this important service by the command in the army on the German frontier. Here he surrounded himself with the most furious Jacobins, and discoursed of war. However, his principal object was to deprive him of the command, and remove him to Perpignan. Augereau found his way to Paris, and was there on Bonaparte's return from Egypt. It is much to Augereau's honour that, discontented as he was with the Directory, and restless as he had been, he went to Augereau, the latter could not count upon his assistance in the revolution of the 18th Brumaire. Bertrandt and Augereau were the only generals whom Bonaparte dared not summon to his sale. Augereau was at St. Cloud; for he had been elected deputy to the Cents, and anxiously hoped that the representative body and the republic would triumph over the military usurper. While the result of the struggle was doubtful, he approached Bonaparte and said, 'Well, you see, one is in the minority.' Augereau rejoined Bonaparte, 'remember Arcole; my fortune seemed more desperate there; yet I retrieved it then, and shall not now.' He was right; the usurpation was completed, and Bonaparte the victor.

The women of Augereau make gray woolen cloaks, called Augers, which are sold in Fezana. The town of Augers is ill built and dirty. The inhabitants speak, besides Arabic, another language which resembles that of Siwash, of which Hornemann gives a short vocabulary.

AUGITE. The minerals to which this name has been applied present us with some of the most interesting and at the same time most difficult investigations that can fall under the notice of the mineralogist and chemist, and have frequently occupied the attention of the most eminent men in those branches. For this reason we have devoted a separate article to them. They are one of the principal ingredients in many porphyry and trap rocks, such as the syenite, diorite, and schoen-roads, green-stone, &s., they form a class of bodies of the highest importance to the geologist. A diatomaceous earths, which are favourable to the formation of one or other of the species, to the exclusion of the rest, would be likely to afford a safe guide in many geological inquiries into the character and formation of rocks of igneous origin. For such reasons we have arranged them before our readers in so satisfactory a manner as possible; but in doing so we encounter considerable difficulty, owing to the uncertain state of our own knowledge on many imp-
The augite genus, is readily recognised by the form of its crystal given in Fig. 1, and by the direction of its four cleavage planes, the most perfect corresponding with the faces {M}, those in the direction of r and s being less easily obtained; and by its pale-green, or greyish-white colour, and vitreous lustre. Its hardness is 5·5, and its specific gravity is 3·299. Alone before the blowpipe it melts into a colourless, semi-transparent glass; with borax, very readily into a transparent glass. Its chemical constitution is expressed by the formula given above, as will be seen by the following analysis of a variety from Tannah by Bondorf:—

Several varieties, little differing from the above, are called backlite and fascite, names indicative of their locality.

2. Hedenbergite, whose constitution may be stated by the formula CaSiO₃ + Mg₂SiO₄, as may be seen by the analysis of G. Rose of a variety from Lunaberg, who obtained of

It is of a dark-green colour, sometimes nearly black.

3. Sahlite, those varieties in which the magnesia is only in part replaced by protoxide of iron, and whose composition G. Rose expresses by

\[ \text{Ca SiO}_3 + \text{Mg FeSiO}_3 \]

Berselius gives the formula,

\[ (\text{SiO}_3 + \text{Fe Si}) + 2 (\text{Ca SiO}_3 + \text{Mg SiO}_4) \]

as expressing the constitution of a variety from Björnmyr, in Sweden, which would therefore be one equivalent of hedenbergite united with two of diopside. He calls it malalakite. (See Anwendung der Mohrschen, by Berselius.)

4. Daillage: the constitution of this variety is expressed, on the authority of

Berselius, by \[ \text{Fe SiO}_3 + 3 \text{Mg SiO}_4 \]

of G. Rose, by \[ \text{Mg SiO}_3 + \text{Ca FeSiO}_3 \]

of F. Kobell, by \[ \text{Ca SiO}_3 + \text{Mg Mn} \]

The difference in the analysis by Köhler of two specimens, the first from Tuscany, the second from Utensinhal in the Tyrol, would perhaps rather indicate the latter:—

| This variety is characterised by its mother-of-pearl lustre, and by its possessing the most perfect cleavage in the direction of the diagonal of the prism. It is seldom found in perfect crystals. Its most general colour is a bronze yellow.

5. Hypersthene, which is very similar in its general appearance and characters to daillage, has the following constitution: \[ \text{Fe SiO}_4 + \text{Mg SiO}_4 \]. Both of the last-mentioned varieties may be distinguished from the former, as well as from each other, by means of the blowpipe, and by attending to the following characters as stated by Berselius:—

Daillage alone in a matrix of mica, becomes of a lighter colour, and gives off a little water.

On charcoal it is with difficulty melted on the edges into a grey worm.

With borax it is diffusely fused into a clear glass, somewhat coloured by the protoxide of iron.
was therefore either hornblende in the form of augite, or augite with the cleavage planes of hornblende. At the village of Mulałakiewski, near Misak, he discovered a still more interesting habit, embedded in a greenstone similar to that last described. They were abundant, and possessed the form of augite: the smaller crystals had cleavage planes parallel to the sides of the prism of hornblende, and were similar in their appearance and colour to those obtained by Cavendish. These also, however, possessed a kernel of a greenish-green colour, and of a lighter tint and greater lustre than the exterior. This kernel differed from the darker exterior portion of the crystal, the latter giving the cleavage of hornblende, while the former presented those of augite, with hues sufficiently bright and perfect to admit of measurement by the reflecting goniometer.

The observations of Mitscherlich and Berthier on the formation of augite are of an uncertain and uninteresting character, and serve only to draw attention to a few interesting in themselves, and throw so much light on the nature of augite in general, and on those crystals we have just described, for which Rose proposes the name of uranie, that we cannot omit to notice them in this place. Mitscherlich has observed that at many foundaries in France, the yellow ores possessed the form, structure, and chemical composition of certain minerals found in nature. From this source he has obtained upwards of forty varieties; and among these, specimens possessing the form and structure of augite were frequently obtained, whereas they were not discovered. Guided by these observations, a mixture of silice, lime, and magnesia in the proportion indicated by the formula \( \text{Ca SiO}_4 + \text{Mg SiO}_4 \) was submitted to fusion in the porcelain ovens of Sèvres, near Paris. On examination, the mass was found to have two almost parallel cleavage planes corresponding with those of augite, and a hollow formed in the centre from the contraction in cooling contained crystals of the form of fig. 1. By these processes they failed in obtaining crystals either of the form or structure of hornblende; but in another instance of placing to refer to the results obtained by those chemists, we must refer our reader to the original papers in the Ann. de Chimie et de Physique, tom. 24, and the Ann. des Mines, tom. 9, particularly those who may be interested in metallographic processes.

Professor G. Rose, in accounting for this production of augite to the exclusion of hornblende, was led to consider that it was not the absence of the fluorine, or any error in the proportion of the elements, which prevented the production of hornblende, but that it was the effect of the rapid cooling. This he fully confirmed by the following experiments: a light-green variety of hornblende, the straithlein of the Germans, from Zillerthal in the Tyrol, was powdered, and to a portion of the powder was added the specified proportion of the elements. It was completely fused, and in cooling had formed fibrous tufts of dark crystals, which, however, admitted of measurement by Wollaston's goniometer, when the angles were found to correspond with those of augite. A specimen of augite, with its localities, was also prepared, cooled into a dark mass, but regained its former structure.

We may therefore consider it to be demonstrated that augite is formed whenever the process of cooling, and consequently of crystallization, is rapid; and hornblende, when it is conducted more slowly. Many circumstances occurred in this view: the uranites of Rose appear to be its natural consequence; for, as by the laws of caloric we know that the quantity of heat lost during equal portions of time varies with the temperature, the exterior portions of the crystal must have a lower temperature, and consequently a gradual loss of heat than the interior, while at the same time the temperature would be maintained by the specific heat given out by the parts first consolidated. The general localities of augite and hornblende, which they are so closely associated, affords another argument in favour of this supposition; for hornblende is usually met with in syenite, trachyte, and lava, accompanied by quartz, feldspar, albite, &c., minerals which decidedly require a slow process of cooling; for those of augite occurs in basalt and lava with olivine, which Mitscherlich has recognized in the scorie of various foundaries, and which is therefore formed by a process of rapid cooling. We are thus able to account for H. von Buch’s remark in his observatory, that all the basalts and lavas which contain feldspar have hornblende, but no augite.

Induced by these circumstances, Rose, in a tabular view...
of the minerals which he has added to his Elements of Crystallography, published at Berlin in 1833, has united into one genus the following species.

1. Diopsidite
   Ca Si₂ + Mg Si₂

2. Schalite
   Ca Si₂ + Mg Si

3. Hedenbergite
   Ca Si₂ + Fe Si

4. Basaltite augite
   Ca, Mg, Fe, Al, Si

5. Rothbaumstein
   Mn Si

6. Aenite
   3 Na Si₂ + 2 Fe Si

7. Diallage
   Mg Si₂ + Ca Fe

8. Bronzite
   Mg Si

9. Hypersthene
   Mg Si₂ + Fe Si

10. Uralsite

11. Tremolite
   Ca Si₂ + 3 Mg Si

12. Antopyllite
   Fe Si + 2 Mg Si

13. Strahlstein
   Ca, Mg, Fe, Al, Si

14. Basaltite hornblende Ca, Mg, Fe, Al, Si

AUGMENTATION, in music of the olden time, was, as Musard Merly tells us, "an increasing of the value of the notes above their common and essential value," and indicated by a sign. It is unnecessary to dilate on this term, which, as well as many others of the same date, has long been known only to musical antiquaries.

Augsburg, the capital of the Bavarian circle of the Upper Danube, stands on a gentle eminence in an agreeable and fertile country, near the influx of the Wertach into the Lech, and between both these rivers, in 48° 21' N. lat., and 11° 54' E. long. It lies 1400 feet above the level of the sea, and in the 45th degree of the agricultural order; it is on the main roads which traverse it, and has long formed one of the central points for the internal commerce of Germany. It is divided into three quarters, the upper, the middle, and the lower town, independently of the suburb of St. James, which lies outside of the walls; it is intersected by four canals, which supply the mills and manufactories of the town with water. The exterior boundary of the glacia has been converted into delightful walks, along which the circuit of the city may be made in a couple of hours; and within the glacia runs a wall flanked with towers, bulwarks, and ditches, which are crossed by four principal and six minor entrances. The streets, with few exceptions, are narrow and irregularly built, and the pavement unsuitable to the feet, being composed of small flints though its disposition in a mosaic form is not unpleasant to the eye. The general appearance of the town is however much improved by the numerous buildings which have sprung up within the last century, and adorned, though it can scarcely be said to be embellished, by the manner in which the generality of the houses are painted with stripes, either green, red, or yellow, always separated by white. Every street and lane is provided with reservoirs for the use of the inhabitants, and a separate work for the purpose of forcing the water into them.

The finest edifice in Augsburg is the town hall, which was built by Holz, in the beginning of the seventeenth century. It stands on a "Centre Hall," perhaps the most splendid apartment in Germany, its length being 110, its breadth 36, and its height 32 feet; it was used for the election of the two kings of the Romans, and was decorated at a great expense with painted ceilings and frescoes, by Kraeger and Rottenhammer, the former of whom was elevated by the gratitude of his fellow-citizens to the Burgraves of their chairs. This hall, with the four royal apartments adjoining, has since been appropriated to the purpose of a museum. Among the thousand paintings which it contains, (the whole arranged in chronological order,) it is particularly rich in specimens of the German school: Kraeger's "Samson and Dalilah;" Albert Durer's "Maximilian the First;" Kraeger's "Last Judgment;" and Rottenhammer's "Bier Gods of Augsburg." A bust of the head of the street, but few will feel disposed to praise even such as these as Guido's "Sleeping Infant;"

Titian's "Venus holding a Mirror to Cupid," or Parmigianino's "Madonna." The collection of models from the antique, which occupy another apartment in the town-hall, is less in character with its external device, "Publico consiliis, publione salutis," than a very considerable collection of ancient and modern description, containing the archives of the town. Adjoining this fine structure is the "Perach Tower," which is ascended by a staircase of 500 steps, and the "Arsenal," the façade of which is embellished with a noble group, representing the "Virtue," by Michael the Archangel, the work of Reuel Von Ran, the Bavarian sculptor. The episcopal palace (the town being still the seat of a bishop's see) is on the Frunhof near the cathedral; it was under this roof that Luther held his celebrated disputations with Cajetan in 1519. St. Ulrich, in year 1518; and under the same roof, on the memorable 26th June, 1530, this great reformer presented the corner-stone of the Lutheran faith, commonly called the "Confession of Augsburg," to the emperor Charles the Fifth. Augsburg was the place from which that sovereign, urged by the unadmonished bearing of the protestants of Germany, proclaimed the "Interim," or religious armistice, which recognised them as a distinct and independent communion. Augsburg also assisted in the taking of the fortress of the Bavarian sword of religious strife, and left the protestants in the full enjoyment of their dearly-purchased immunities. The venerable walls of this palace were, in 1817, converted partly into offices for the government of the province, and partly into apartments for the accommodation of the visiting traders. Among other conspicuous buildings are the "Halle," a handsome commercial mart and storehouse, which has a machine for weighing loaded wagons and merchandise in bulk, and is now partially used for judicial proceedings; the "Vogt's palace," in which is rich with old manuscripts; the "Franziskaner academy of arts;" the school of the arts; and the "Cathedral," which was built in the fifteenth century on the site of the ancient Basilica, erected in the tenth. This edifice is 350 feet in length, 140 in breadth, and 150 in height; and the transept is 120 feet in length, and 60 feet in breadth, the side aisles are fitted up with four and twenty chapels, independently of several pictorial embellishments of a central portico, and two stone portals which divide the main aisle from the choir, are about six feet above the floor, and are decorated with figures and emblems, dating from the year 1484. A visit to St. Ulrich's church, which is 310 feet in length and 94 in width, will be amply repaid by the respect from its lofty steeples (which is 148 feet higher than the monument of the vaulted hall in London) of the altar of Augsburg. The altar of the church stands on the side of that fine specimen of sculpture called the "Altar of the Crucifixion," and other striking objects. Of the numerous monasteries, convents, and ecclesiastical establishments of Augsburg, fifteen churches only remain, five of which are appropriated to the use of the church, and the remainder, as endowments there are few spots of the same extent rich; and we believe that three-quarters of a million sterling are rather below than above the aggregate amount, by which which is the property of these foundations, stands the institution called the "Fuggers," established in the year 1519 by two brothers of the Fugger family, who were the founders of more than one cardinals of the present day; it is a town of itself, situated in the suburb of St. James, has its own church, consists of three streets and as many lanes, has three gates, and contains 107 belfries, is out to indenture natives of the town, at a rent of two shillings per annum. A philanthropist of our own times, Lawrence Schaepetel, a banker of Augsburg, has more than fulfilled his "good word,", by establishing a school of industry for 100 poor children and orphans of this his native town, in 1813; and then, twelve months afterwards, by erecting an asylum within the walls of the old Dominican monastery for the reception and maintenance of indigent women, forty-five operatives, and seventy-six children, who are educated on the Lancaster system. To these institutions may be added an admirably conducted orphan asylum, and a book for teaching the educated classes in making provision for the instruction of their humble fellow citizens, every religious community in the town has schools of its own, the twenty seven week day schools are attended by nearly 2000 children, the Sunday schools about 20000, and the three female schools of industry by four hundred. Between five and six thousand youths of superior
The merchants of Augsburg: their cabinets and libraries were adorned with their gardens and mansions: the first tulip known in the west of Europe was brought to Augsburg from Constantinople, and planted by Heerwat, in 1557. Such, in short, was the splendid appearance of this city at the close of the sixteenth century. The Bishops of Augsburg, once the hereditary lords of the city, had disappeared under the domination of the Frankish sovereigns, and in 788 was almost razed to the ground during the war which raged between Charlemagne and Tassilo of Bavaria. Upon the dissolution of the Church property, Augsburg fell under the sway of the dukes of Swabia; but by commerce and manufactures, it gradually shook off all external authority, purchased its independence of its episcopal sovereigns, was recognized as a free state by the German emperors, and retained its rank as a free imperial city for upwards of five hundred years—namely, from 1276 to 1606. From about the twelfth until the sixteenth century, it was a leading member of the famous Swabian Confederacy, which included Ratizien, Nuremberg, Constance, and other commercial cities of the empire. In the fifteenth century it was the chief medium of intercourse between the north and south of Europe and the Levant, and supplied the markets of northern Germany, Russia, Poland, and other countries, with wondrous and industria; and is renowned its merchant cities were the rivals of the Spaniards and Portuguese, at the close of the fifteenth century, opened new channels to commercial enterprise. It was at this period of its highest prosperity that the single most important trading establishment in four centuries, started in the sixteenth century, the case of Frankfurt on the Main inflicted a blow on the prosperity of the town from which it has never recovered. Augsburg indeed ceased to be a place of importance in the circulation of exchange in Europe, though it continued to be a chief money-market of central Germany. A law was made in Augsburg (the date we are not acquainted with), that an Augsburg merchant might, at any time between the acceptance and the maturity of a bill drawn on him from any other merchant of Augsburg, in the absence of the ultimate acceptance, sign the bill. Whether this law now exists we are not quite sure, nor can we undertake to say how much of the decline of the commerce of Augsburg is due to it. Under the settlement of Germany, in 1609, Augsburg was recognized as one of the six Hanse towns, which were declared independent of the German empire; but three years afterwards it was merged into the dominions of Bavaria, under the treaty of Preßburg; and in March, 1606, it was surrendered accordingly in his imperial majesty's hands, the French general René, acting under the orders of Napoleon Bonaparte.

Augsburg is the birthplace of Holbein, Holl, and other eminent artists. The gardens and places of public resort of the town, which are much admired, are traversed by 220 bridges and crossings. Augsburg produces about eighty tons of beet-sugar per annum; and manufactures mathematical and musical instruments, paper-hangings, printing-stones, and carpets; and a variety of articles of pure luxury. Its population at the present day amounts to about 35,000, of whom rather more than one-third are protestants; but it was much greater in former times, for the yearly average of births, which are at present under 9000, was upwards of 2200 in the beginning of the sixteenth century; even in the seventeenth they were above 1000; and in the middle of the eighteenth, it increased again to nearly 1300; from which number they have since gradually declined to their present average. We may add, that at the close of the sixteenth century the number of its inhabitants is stated to have been 60,000.
and Wolfang, Prince of Anhalt; besides those of the five towns of Nuremberg, and other cities. The Confession was immediately afterwards printed, and, being translated into various languages, was spread over Europe. It has ever since continued to be the rule of the Lutheran Church in matters of faith. It consists of twenty-eight articles, approved by Luther and another thirty-nine proposed by other Reformers. Zoinge and the other Swiss and French reformers did not subscribe to the Confession of Augsburg, as they differed from it on several points, particularly about the Lord's Supper. The style of the Confession is clear and fluent, and though the title by Luther appears in the first seventeen articles of Targus, which he had presented to the Elector of Saxony the year before. Melanchthon, while drawing up the Confession, had frequent conferences with Luther, who was then staying at Coligny, not far from Augsburg. The Papal theologians, headed by Faber, wrote a confession of the Augsburg Confession, which was likewise read before the Diet in August of the same year. Melancthon answered them in his Apology for the Augsburg Confession, which was published in 1531, and which constitutes one of the books of authority of the Lutherans which were published, including the Confession, at Dresden, in 1536. Ernest Solomon Cyprian has written a good history of the Augsburg Confession, and Webber a Commentary on it. (See Kirchengeschichte; and Hesmeir's Ecclesiastical History, and Notes, by Dr. Murdock.)

AUGSBURG GAZETTE. [See Allgemeine Zeitung]

AUGST, a village in the canton of Basel, in Switzerland, built on part of the ground occupied by the ancient Augusta Rauracorum, a Roman colony under the empire. The remains still existing are not very considerable; they have not been newly discovered by the celebrated Itinerarist. Medals of Roman emperors have been found in abundance in the ground. Augst is situated on the left or southern bank of the Rhine, six miles S.E. of Basel.

AUGUR. The earliest inhabitants of Italy, like all rude nations, imagined that they saw in every unusual occurrence a manifestation of the will of heaven. The power of interpreting the signs thus furnished by the gods was thought to depend upon a peculiar talent conferred upon the favoured mortal from his birth, but a certain discipline was necessary to enable him to interpret the delusions of fate, and guide the actions of the body of men. The diviners were, deep seated in the minds of the people was turned to account in the political constitution of Rome, by the establishment of a college of augurs, whose duty it was on all occasions, whether relating to the public welfare or to private affairs, to ascertain the will of the gods, and report the pleasure or displeasure of the gods. Romulus himself was said to have been skilled in the arts of divination from his earliest youth, and at the foundation of the city the claim of the rival brothers were decided by augury. The story of Tanaquil, of Servius Tullius, and still more the contest between the elder Tarquin and Attus Navius, afford additional evidence of the peculiar nature of this Roman superstition.

The institution of the college of augurs may be referred to the very earliest period of Roman history; for the assertion of Livy (i. 18, and iv. 4), that there were no augurs in the reign of Romulus is not merely opposed to the general tenor of the history of Rome, but directly contradicted by Cato (see p. 63). The college of augurs is again differently reported. Cicero, himself an augur, says that Romulus associated three others with himself, and that Numa added two. (Id. 14) Livy reports that in the opinion of the augurs of the time the number of the college was fixed at the number of the tribes, and that consequently there must have been at the beginning either three or six; so that each of the three tribes should have either one or two augurs. On the other hand, we have interpolated in the ancient Rome that, prior to the Ogulian law, there were but four members of the college. In these different accounts Niebuhr has pointed out strong reasons for giving the preference to the last. 'The notion of there having been three or six augurs of the same number as the number of the tribes, and if all the tribes had stood on an equal footing, the argument would have had much weight. But the same writer has fully established the fact that the first two tribes possessed higher privileges than the third, and this in a more marked manner in the offices of a religious character, so that the number four, two for each of the privileged tribes, seems to point to a similar distinction in the highly-important powers of the augurate. On the other hand, it being clear that Cicerus in his fourth book number six, his mode of accounting for that number is wholly at variance with the reasons of the augurate as reported by Livy. Again, if, as Cicero implies, Romulus was the first augur, and if Romulus was the first augur, then there must have succeeded likewise to the augurate office, a supposition in no respect confirmed by history, and scarcely compatible with what is reported of Tarquin's dispute with Attus Navius. Moreover, if such a power had passed through the hands of forty, it is not likely that the course was pursued at the change of the government from the royal to the consular form. At that revolution the political powers of the king devolved upon the consuls, or priests as they were at first called, and of a religious character upon the priest, called rex sacrificialis; but there is no trace of evidence to show that the authority of the latter ever included the powers of the augurate. Under this view of the subject, Niebuhr is of opinion that originally there was but one augur, R. Naevius, who was made augur in 442 B.C. (Livy, x. 23), and who held the office for two years. He afterwards was re-elected for life, and his successor was called Numa Pompilius. The second and third, the latter of these two, the augurate was transmitted to C. Numa Pompilius, and then to Numa. In this state had its two augurs; that at a later period, when the Titiienses were admitted to a share of these privileges, two others were added. This is confirmed by the statement of Cicerus that Numa added two to the college, for the name of the augurate was made to have two diviners, one in the second tribe. Livy, in his wish to reconcile the different accounts, has been driven to the supposition that when the Ogulian law was brought forward, there may have been five vacancies by death; but it is not probable that the patricians would allow themselves to be elected by a college through such an accident, especially as even after the law was brought forward it was not too late for the remaining augurs to fill up the supposed vacancies—for in each generation of three years the office was allowed to be brought forward by Q. and Q. Cocceius, and Quinctilius, and Numa augmented the number of the college. The law, on the other hand, was complete without the sanction of the augurs: so that the college possessed a virtual veto upon the admission of all members into it. (Dionys. ii. 32.) This power was not unlikely to lead to a gradual usurpation of the elective right; and thus, as early as the year B.C. 458, we find, in the practice of the college to fill up vacancies by co-optation as it was called, that is, by the votes of the existing augurs. (Livy, iii. 32.) This mode of election continued to the third consulship of Marius, B.C. 103, when the tribunes Ca. Flamininus and Ambroseus introduced a law, that in case of vacancy in any of the sacred colleges, fourteen out of the thirty-five tribes chosen by lot should, by a majority of the votes of the said seventeen tribes, nominate a successor, or if no such were chosen, the college should be dismissed. (Cic. juris. lett.)

The return of Sulla to power revived the election to the college; but in the consulship of Caecina (B.C. 63) T. Attus Laebuc, with the support of Caesar, procured the reversal of Sull's law. (Dionys. iv. 55.) At first the college of augurs consisted of six members. In the year 37 B.C., one of the offices of the chief pontiff, and therefore, most probably, in that of the other priests. (Dionys. v. 53.) We have already mentioned that the emperor had the privilege of appointing augurs at his own discretion.

The reverence which was paid to the supposed seances of the augurs would be tedious to enumerate; but that which especially characterized the augurate office was the pretended power of communicating to the consuls the will of the gods in important matters. The augurate was a seat of elevated spot, on which they were seated, and their heads veiled and their feet turned towards some
ticular quarter of the heaven, varying perhaps according to the occasion; for the accounts differ so much that, while Livy says it was the east, we have the authority of Varro for the south, and Frontin for the west. When the augur, with a golden rod or staff, free from knots, called a lictor, marked off a certain portion of the heavens and of the earth, within which his observations were to be made, and again divided this portion into two parts—the right and left—and the augurs given the augur, called a templum, and the steadfast observation of the augur directed upon it may probably account for the meaning of the Latin word con-templa-ri, to contemplate, which has been adopted into our own language. The gods then signed their consent by a reverential bowing of their heads to the left, and the augury was complete. For some purposes the whole circumference of the heavens, together with the corresponding parts of the earth, were divided, according to the order of the zodiac, under these and others parallel to these. (Liv. i. 18. Dionys. ii. 70, and the appendix to the translation of Niebuhr, vol. ii.) So prominent a place did the feathery creation hold as the interpreters of the divine will, that and, the Latin for bird, is the chief element in the term augur, as it is also in the nearly equivalent word auspex (anispec). In the latter, the second syllable is deduced from spei, look, so that the word signifies bird-observer. The second element of the word augur does not need an explanation; except to notice, that in the Latin language we have called the terms nearly equivalent, and if Plutarch's authority had been sufficient (Rom. c. 72), we might have dropped the qualifying adverb. But a Roman antiquary would have pointed out many other classes of persons, important in this respect, these are, that the leading magistrates of Rome possessed the auspices (Cic. de Leg. iii. 3) by virtue of their office, while the term augurium never refers to any other than an augur. The name augur does not appear to have been in early times a technical word, and indeed was but rarely employed; but the derivatives from it were frequently used, and applied with considerable latitude to the augurs as well as to the magistrates. The objects of the auspices and augurium were both under the supreme direction of Jupiter, and of a similar nature. Moreover, all legal disputes about the auspices of the magistrates seem to have been referred to the augurs. Under all these circumstances we shall not attempt to draw a very nice line between them.

There were, as we have already stated, besides the movements of birds, a variety of other occurrences in the physical world which, as expressive of the will of heaven, came under the cognizance of the augurs. We shall not attempt to give the whole list of the more important, but confine ourselves to those which seem to have been of political importance; the election of a king, a consul, a dictator, a praetor, a censors, a curule aedile, the commencement of a war, in fact, all that is done by the people; all was left to the augurs to determine. It is the view to-day of those who hold that the augurs were in reality the interpreters of the will of the gods, that it is absurd to consider that they were able to determine by anything they saw the course of human events; that it is the duty of a godlike authority, as, for instance, the king, to discharge the duties of the augurs. The Romans were a people of a very religious character; that, if there was any disturbance of the peace, it was the duty of the king to take such the direction of a thing which he believed in; and the public money might perhaps be traced in the conduct of the emperor. Hence the emperors of Rome have been accused of having been in the pay of the augurs, and that the result of their election, which were celebrated in the annals of Roman antiquity. (Cic. de Fam. vii. 16; Varro, R. R. iii. 6; Plin. H. N. x. 23.) In the latter years of the republic many of the duties of the augurs were performed in the most lax manner. At the time of the inauguration of a magistracy, it was customary, in observing his own time, the ceremony is a mere shadow of what it was. The candidate takes his seat, rises, repeats a set prayer in the open air, an augur then declares he hears the voice of Jupiter, order is restored on the front, and the candidate forthwith enters upon his magistracy.

AUGUST. The month of August was originally called Sextilis, being the sixth month in the Alban or Latin calendar; and this name, as is stated, it retained in the calendars of Romulus, Numa Pompius, and Julius Caesar. Since Numa's reform, however, it has held only the eighth place in the series of months. In the Alban calendar, Sextilis consisted of twenty-eight days; in that of Romulus, twenty-nine; in that of Numa, twenty-nine; in that of Julius Cesar restored it to thirty; and Augustus, the name from whom it derived its new name of Augustus, extended the number of days to thirty-one, which has continued ever since. It was originally proposed that September should bear the name of Augustus, from the emperor having been born in that month; but he preferred Sextilis, not only as it stood next to July, which had been recently named after his predecessor Julius, but for the same reasons which influenced the decree of the Senate detailed by Macrobius, in his Saturnalia (edit. Bipont. i. 261), viz., that since it was in this month that the Emperor Cæsar Augustus had entered upon his first consularship—had celebrated three triumphs in the city—had received the allegiance of the soldiers who had been sent to him to protect the empire against the danger of a civil war—it appeared that it was, and had been, proitious to the empire; and the Senate therefore ordained that Sextilis should henceforward bear the name of Augustus. Gessendi; (Kalend. Romanus, apud Grrev. viii., col. 164) says that Commodus wished to have had the month Sextilis called by his own name.

The Flemings and Germans have adopted the word August for Harvest; Oogst maand is the harvest-month. (Tryon, Historical Geography of Flanders, p. 167.) The word August is the name of a month in the calendar of(Float. viii. 217.) So the German August-wagen, a harvest-wagon (see Wachter, Glossar, German.); and the Dutch Oogen, to reap or gather corn from the field (Sewell's Dictionary of English and Dutch Words, p. 56), which was formerly used in the Low Countries to express the act of gathering in harvest; and both French and Spaniards have phrases for making harvest, faire l'automne, and hazer eu Augusto.

Our Saxon ancestors named it August Pæwb monâbb, the wood-month, as abounding in nutritious and useless herbs. (Saxon Menolog., and Lyre's Saxon Diet. in voce.)

Lammas Day, the first of the month, is also called the Gule of August (see Brand's Popular Antiq., i. 275), probably from the Gothic Hooic or Huc, indicating that the 'fertility of the field, because of the abundant harvests, was the reason the festival was instituted on this day, called by our Anglo-Saxon ancestors Hæbb-mætne, i.e. loaf mass, was the feast of thanksgiving for the first fruits of the corn.

(Compare Bracie Lexicon Antiq. Grec. et Român., v. Augustus; the different Treatises printed in Graviius's Collection; and Brady's Clausis Calendaria, i. 76.)

AUGUSTA. This title was first given to his wife Livia after the death of Augustus according to the will of the emperor. (Tacitus, Ann. viii. 53, where Claudius on Agrippina (A.D. 51), and by Nero on his wife Poppaea as well as her daughter (A.D. 64).) Eventually it became a common title, of the mother, wife, sister, or daughter of an emperor.

AUGUSTA. This name was also frequently adopted by towns, sometimes in place of, sometimes in addition to the previous name; also many new colonies received it. Thus we find Augusta in the country of the Salassi, now Aosta; Augusta Taurinorum, now Turin; Augusta Rauracorum, now Augst near Basle; Augusta Vindelicorum,
AUGUSTINAUGUSTIN, ST., Bishop of Hippo, also called Aus· tius Augustinus, one of the fathers of the church, was born, as he himself informs us (Epist. 227), at Tagaste, a town in the province of Numidia, about 76 years in North America; and American Almanac for 1834.)

AUGUSTA HISTORIA, the name given to a series of Roman historians, or rather biographers, who wrote the lives of the Emperors, and the history of the Roman empire down to the death of Carinus, the immediate predecessor of Diocletian: these lives compose a period of 167 years of the history of the Roman empire. They may be considered as a continuation of Suetonius's Twelve Caesars; except that between Diocletian and the last emperor in that series, the reigns of Nerva and Trajan are not included in either of the two series. We know from Lampadius that four historians had written Trajan's biography, Marcus Maximus, Fabius Marcellinus, Aurelius Victor, and others; and a Vestal girl, who had taken the name of Africa Augustus, was the last. The writings generally included in the collections of the Historia Augusta are six in number; they lived under Diocletian and his successors Constantine and Constantine. They are: 1. Aluisius Spisanianus, and his colleague Aluisius Verus; of Dellius Julianus, of Sepinus Severus, Pascentinus Niger, Antoninus Caracalla, and Antoninus Geta. Spartanianus dedicated the first four to the emperor Diocletian, and he states in his life of Aluisius Verus, that his intention was to write the lives of all the emperors from the great dictator Julius Caesar, and of all those who, whether they were the sons or relatives of the emperors, or were by them adopted, had received the title of Augustus, beginning with the issuing of his Life of Verus, that he had written the lives of the two Constantines before Halmian, which however have been lost. 2. Julius Capitolinus is the second writer in the series. He wrote the lives of Antoninus Pius, of Marcus Aurelius, and of the second Verus. He also wrote the lives of Pertinax, of Claudius Albinus, of Ophius Maximus, of the two Maximini, of the three Gordians, and of Maximus and Balbinus. He appears to have written other works also, which are lost. 3. Julius Lampadius, to whom we are indebted for the life of Elagabalus, Antoninus, and Alexander Severus; the two last are dedicated to Constantine. There are, however, considerable doubts whether some, if not all of these, were written by Spartianus; and both G. Voss and Faberius seem to think it not unlikely that Aluisius Spartianus and Elais Lampadius are one and the same writer.

See literary notices prefixed to the Bipont edition of the Historia Augusta. 4. Valerius Gallicianus, a senator of Rome, of whom we have only the life he dedicated to Diocletian. 5. Trebellius Pelleius: we have fragments of his lives of Valerian the elder, and his son Valerian the younger; the lives of the two Gallieni; and those of the Thirty Tyrants, who assumed various parts of the empire and the dioceses of the distracted reigns of Valerian and Gallienus. Among these thirty, Trebellius Pelleius has reckoned two women, the famous Zenobia of Palmyra, and one Victoria. He has also written the life of Flavius Claudius, one of the ablest and best emperors, and the first of the line of Aurelian; and he has endeavored to repair the evils of the disastrous reigns which had preceded his. 6. Flavius Vespasianus of Syracusae. He lived under Constantine, and wrote the lives of Aurelius, of Tacitus, and his brother Florianus, of Probus, of the four emperors, First of the East, and the two emperors of the West, who usurped the supreme power in various parts of the empire under Aurelian and Probus; and also of the three emperors, Carus, Numerianus, and Carinus, who immediately preceded Diocletian. Here the collection called Historia Augusta generally ends. Some editors, however, have added Eutropius and Paulus Diaconus, two writers of a very different class from the preceding. (See the Milan edition of the Historia Augusta, 1473.) Others have included the three last writers of the Bipont edition. (See Aldine edition of the Historia Augusta, 1819.) But in general the Historia Augusta consists of the Roman writers above-mentioned. Claudius Eusthenius wrote the lives of Diocletian, Maximinus Herculeus, Constantius, and Maximinus Daia; and his work is preserved in the Historia Augusta, had they not been lost. There is a break in the Historia Augusta occasioned by the losses of Philipicus, Decius, and Gallus, which are wanting. (Fabricius, Bibliotheque, ed. vo. 20.) 7. Claudius A.D. vo. 14. 8. Lucius Latrus; and the Bipont edition of the Historia Augusta.

AUGUSTIN, ST., Bishop of Hippo, also called Aus· lius Augustinus, one of the fathers of the church, was born, as he himself informs us (Epist. 227), at Tagaste, a town in the province of Numidia, about 76 years in North America; and American Almanac for 1834.)

AUGUSTA HISTORIA, the name given to a series of Roman historians, or rather biographers, who wrote the lives of the Emperors, and the history of the Roman empire down to the death of Carinus, the immediate predecessor of Diocletian: these lives compose a period of 167 years of the history of the Roman empire. (See the Milan edition of the Historia Augusta, 1473.) Others have included the three last writers of the Bipont edition. (See Aldine edition of the Historia Augusta, 1819.) But in general the Historia Augusta consists of the Roman writers above-mentioned. Claudius Eusthenius wrote the lives of Diocletian, Maximinus Herculeus, Constantius, and Maximinus Daia; and his work is preserved in the Historia Augusta, had they not been lost. There is a break in the Historia Augusta occasioned by the losses of Philipicus, Decius, and Gallus, which are wanting. (Fabricius, Bibliotheque, ed. vo. 20.) 7. Claudius A.D. vo. 14. 8. Lucius Latrus; and the Bipont edition of the Historia Augusta.
unanimously of opinion that he should be chosen one of their number. In 393 he became coadjutor to Valerius, and not long after was elevated to the bishopric of Hippo. He appears to have established about this time a kind of clerical community within his episcopal residence; and was still active in his opposition, not only to the heresies of the Manichæans, but to the Manichean doctrine. The Waldenses called De Civitate Dei, is believed to have been begun a.d. 413. In 418, after the general council held at Carthage, he produced his two works against the Pelagians, De Gratia Christi, and De Peccato Originali, from the former of which he.summarized the opinions of the "teachers of Origen." His labours were continued both personally and by his pen to the close of his life. His last work was his Confessiones.

In the latter part of his career, however, he had other comrades besides those of the church. The Waldenses had entirely overrun Africa, and passed even into Spain, and Augustin now had for his opponents the enemies of the empire. Carthage and Hippo made resistance for a considerable time; and St. Augustin, though pressed by his associates, refused to quit his flock and escape by flight. Still he saw the imminent danger to which Hippo was exposed; and dreaming that it would fall into the hands of the enemy, prayed to God that before that calamity happened, he might have an opportunity of answering the question, if it should appear, was answered, as he died during the third month of the usage of fever, August 29th, a.d. 430, at the age of 76. (Victor Vitensis Episc. Hist. Persecut. Vandecacie, v. 80. Paris, 1694, p. 113.) The Vandals, who took Hippo the year after, pillaged the city. His body, Victor Vitensis (Hist. Persec. ut supr. p. 6) says his library contained at that time two hundred and thirty-two separate books, or treatises, on theological subjects, besides an exposition of the Psalms and the Gospels, and an innumerable quantity of homilies and epistles. The Catholic bishops of Africa carried his body to the island of Sardinia, the place to which they were driven by Thrasamond, King of the Vandals, a.d. 509; and Luippard, King of the Franks, a.d. 721, from Sardinia to Pavia (Borroni Annales, fol. Lesen, 1738-54, tom. xii. p. 390.) An account of the supposed discovery of his relics, at a later time, will be found in Mainfasonis De Inventione, ap. Paris, 1799, pp. 24, 47; see also Munsteri, Antiq. Ital. Mediae Aevi, tom. v. fol. Milan, 1741, dissert. viii. p. 9.

St. Augustin's works, as the reader will have gathered from the preceding account of him, were numerous, and have been printed in a collected form repeatedly: at Paris, in 10 vols. fol. 1532; by Erasmus, from Frobenius's press, 10 vols. fol. 1540-3; by the divine of Louvain, 10 toms. fol. 1546; and by the Benedictines of the congregation of St. Maur, 10 toms. fol. Paris, 1679-1700; 12 vols. fol. Bâle, 1700. The reader who is desirous to become acquainted with the detached titles of St. Augustin's works, may consult the Index Scriptorum Christianorum, by his friend and colleague, C. d'Albigny, skilfully and accurately compiled, and published for the month of August, tom. vii. pp. 441-450, with annotations; and the same work, pp. 353-357, for the progressive years of the production of the greater part. Some of St. Augustin's works are among the earliest specimens of typography known in our libraries. The Liber de Arte Predestinationis was printed by Fust at Mentz, in folio, before 1466, and another edition appeared in that very year from the press of Mentz. The first edition of the treatise De Civitate Dei was printed by Swayneheim and Pannartz, in the most part by hand, in 1472, and repeated in 1473. De Vitæ Christianæ, and De Singularitate Ciceronii, in the same year, by Olibra Zell, at Hanau, in 4to.

The character of Augustin, says Chalmers, has been depreciated by some moderns; but ought undoubtedly to be considered with a reference to the times in which he lived, and the state of learning and religion. There is neither wisdom nor caution, however, in collecting and publishing the faults of his early years, nor in denying that he may have made mistakes, or has fallen into errors. Those who preserved and elucidated many of those doctrines which are held sacred in days of more light and knowledge. The following is the character of him which has been described by Bishop Moser. The fame of Augustin, Bishop of Hippo, died the whole world over; and ought undoubtedly, as a variety of great and shining qualities were united in the character of that illustrious man. A sublime genius, an uninterrupted and serious pursuit of truth; an invariable integrity; a spirit of laborious diligence and industry; and a sublime and lively wit, consoled to establish his fame upon the most lasting foundations. It is, however, certain that the accuracy and solidity of his judgments were by no means owing to the bequest or donation of the eminent talents now mentioned; and that, upon many occasions, he was more guided by the violent impulse of a warm imagination than by the cool dictates of reason and prudence. Hence that ambiguity which appears in his writings, and which has excited such great altercation. The reasons are uncertain with respect to his real sentiments; and hence also the just complaints which many have made of the contradictions that are so frequent in his works, and of the levity and precipitation with which he set himself to write, and especially in his later vices, which he referred to the influence of Manichæans, to which he related his connexion with the Manichæans, will be found in Lardner's Credibility of the Gospel History, part ii. vol. vi. pp. 38, 39, and again part ii. vol. x. pp. 299-303, where the value of Augustin's works may be estimated by the opinions of his contemporaries. His books are, however, such as Lardner has drawn from them. The more ancient lives, however, from which the chief facts of the preceding account have been derived, will be found in the 8th volume for the month of August of the Acta Servatorum Ecclesiae, and in the Ecloga Augustini in Actis et atasis ad obitum, by Sozennio, and sozennio, quosque per annos ero quadrangulis conscriptus: Ex ed. Romani, anno 1713, cum versiculo M. collat. Another ancient life of St. Augustin has been more recently edited:—Vita D. Aev. Augustini Episcopi Hippomariani, auctore incerto, ex antiquo codice nume primo editi Andra. Gul. Cramer, 8vo. Kilims in Libraria Universitatis, 1823.

Augustin (St.) Canons of the Order of Usualy called Austin Canons. Regular Canons, says Bishop Tanner (Pref. to Notiti. Monast.), were such as lived under some rule: they were a less strict sort of religious than the monks, but lived together under one roof, had a common dormitory and refectory, and were obliged to observe the rule of St. Augustine. The chief rule for these canons was that of St. Augustine, who was made Bishop of Hippo, a.d. 395. But they were little known till the tenth or eleventh century, when not a few were brought into regular orders. They seem not to have obtained the name of Augustin or Austin Canons till some years after. (Bingham, Antiq. of the Church, b. v. c. 2. s. 9.)

Bale (Script. cent. xiii. 4.) and Sir Robert Althyn (Antiq. of Glouc. p. 1) say, that these canons were brought into England by St. Birinus in the beginning of the seventh century; a.d. 630 or 640, as Fuller states in his Church History (b. vi. p. 369); but those were certainly secular canons whom he placed at Dorchester in Oxfordshire; and who were in other respects agreed to, were secular canons from the same period. According to Fuller (CA. Hist. ut sup.), they were seated in London, a.d. 1049; but this is not believed. Sommer says that St. Gregory's is in Canterbury, which was built by archbishop Lanfranc a.d. 1084, was their first house (Antiq. h. c. 6. p. 89), but is sure that St. Gregory's was not built till the eleventh century. According to (CA. Hist. ut sup.) p. 89) that Archbishop Lanfranc placed secular canons at St. Gregory's, and that Archbishop Corbey changed them into regulars, makes the authority of that judicious antiquary in this case doubtful. Reyner says (Apostol. Benedict. etc. p. 157) that these were not a community of the Austin Canons of Athelwulphus or Alphubus, confessor to King Henry I, N 3.
AUGER, Pierre François Charles, Duke of Castries and Marshal of France, was born of noble parents in Paris on the 11th of November, 1757. He first enlisted in the French carabiniers, and from thence entered the Neapolitan service. He obtained his discharge in 1787, but continued to reside at Naples, where he gave lessons as a fencing-master, and then the war being over, he now settled at Paris, where he lived in modest seclusion upon a small income, entirely devoted to his favourite studies. After the publication of his translation he was elected a member of the Academy. His next works were a translation of "Isocrates," 3 vols. 8vo., 1784, and one of "Lycurgus," 8vo., same year. He applied with equal zeal to the study of the great Roman orator, and translated the whole of his "Orations," of which he has published one volume. He died at the same time as the death of the constitution of Rome: "De la Constitution de Rome sous les Romains, et au temps de la République," which was published after his death as an introduction to the whole of "Cicero's" Orations. 10 vols. 8vo., 1784-4. The essay on the Roman constitution fills the first volume, and as an abridgment it may even now be consulted with profit, although it has been in some measure superseded by Niebuhr's more elaborate and more profound work on the history of Rome. Auger's object was to develop the system and the working of the Roman political institutions in their three essential parts—the legislative, the executive, and the judiciary. The second volume is a continuation of the first, being engrossed by a life of Cicero, chiefly relating to his public actions and his correspondence with his contemporaries. The work is valuable for the Excellencies of the Roman republic at the epoch preceding its fall. The study of Cicero and of Roman history occupied, in great measure, the last thirty years of Auger's life. He was a regular writer, in the mean time, selections from the works of the two Greek fathers, Chrysostom and Basil: "Homelies, Discours, et Lettres choisies de St. Jean Chrysostome," 4 vols. 8vo., 1785; and "Homelies et Lettres choisies de St. Basil le Grand," 4 vols. 8vo., 1786.

The first symptoms of the French revolution found Auger deeply engaged in his meditations on the Greek and Roman republics. He felt naturally favourable to the general principles of constitutional liberty which were then promulgated in France, and he wrote several pamphlets in favour of this subject. The political economy was, at that time, a new system of public education. In this "Projet d'Education Public," that is to say, the outlines of two distinct plans: one for learned classes, and another for the education of those who, not being able or not wishing to study Latin and Greek, might yet be deacons being instructed in the literature of their own country, and of the great events of the times, as well as of the philosophy and metaphysics in their native language. In a subsequent little work, "Cicéron et le Citoyen Français," 1802, 1801, he reverted to the subject of education, observing, that his former plan being intended for the higher and the middle classes, there still remained a large body of men, whose knowledge was limited to the humble state of the towns people and the rural population, for whom he had sketched out the present césant. It may have been deemed advantageous, he observes, "under the former system of government, to keep this vast multitude in ignorance, but such a state of ignorance becomes dangerous now. This class, with the knowledge of its strength, ought also to acquire the knowledge of how to use that strength without abusing it—ought to be told its duties as well as its rights—ought to become instructed, orderly, and moral. In his césant he clearly defines the rights and the duties of individuals under a system of well-understood liberty; and he draws the line between liberty and the liberty of violence, between the equality of men and equality, which is inherent in the nature of men. That line, however, was soon after obliterated, and the consequences were fatal to France and to Europe; but the good Auger was spared the grief of seeing the catastrophe; he died in Paris on the 29th of January, 1804, after having escaped the revolution by the death of the father of the Revolution, the Duke of Sèvres, who afterwards figured as a member of the Convention, and who had studied Greek under Auger, composed his funeral oration. Auger was a man of great eminence, in command of the implements of eloquence. He was then at work, a treatise on Greek tragedy, was published a few days after his death.
was unable to effect the passage over the bridge, but still he was rewarded by a decree of the Directory, granting to him, in commemoration of his bravery, the standard that he had borne on the occasion. [See ARCOLE.]

In the following year, 1797, the attention and interest of the world turned to the scene of action in the East, where the foreign powers, having united, fixed upon the parties which disputed for supremacy at home. The Directory was menaced by the Royalists, as well as in a great measure by the friends of constitutional government, who now began to rally to the cause of a recovery of the Constitution, which had been restored to the public. But this party, amongst its other imprudent acts, committed the great mistake of making the armies hostile to it. Bonaparte was accused for his conduct towards Vene
evex as an assassin of the Directory. The general reply of offering his services to the Directory, and by sending addresses from his soldiery in favour of republicanism. In the camp of the army of Italy Augereau was no less in his executions of royalty, and so extreme in his revolutionary ideas, that Bonaparte, at once to get rid of him, and to provide the Directory with a useful agent, sent him to Paris. Here he continued his tone of vaunting and violence amidst the feuds and hatreds with which he surrounded himself, and most furious Jacobins, and displayed so dangerous a spirit, that the Directory was obliged to deprive him of the command, and remove him to Perpignan. Augereau found his way to Paris, and was there on Bonaparte's return from Egypt. It is much to Augereau's honour that, disenchanted as he was with the Directory, and connected as he had been with Bonaparte, the latter could not count upon his assistance in the revolu
tion of the 18th Brumaire. Bernadotte and Augereau were the only generals whom Bonaparte dared not summon to his sale. Augereau was at St. Cloud; for he had been elected deputy to the Cinq Cents, and anxiously hoped that the representative body and the republic would triumph over the military usurper. While the result of the struggle was in the air, and as the tide rose, Bonaparte said, 'Wel
you have brought yourself into a petty dilemma.' 'Augereau,' rejoined Bonaparte, 'remember Arcole; my fortune seemed more desperate there; yet I retrieved it then, and shall now!' He was right; the usurpation was completed, and he was submitting with the rest.

Bonaparte distrusted his old comrade too much to appoin him again to the army of Italy. During the campaign of Marengo, Augereau commanded a division, for the most part Dutch, on the Lower Rhine, where he had hard fighting and little glory. After the treaty of Lu

The recovery of his health. In the years 1809 and 1810, he commanded in Catalonia, where he showed but little inery to the Spaniards. Considering Augereau as a ve

ern general, Napoleon, instead of taking him to Russia in 1812, left him to form a corps of reserve at Berlin. This, however, was not the case, for he resisted the attempts of the enemy, and it was with some difficulty that he escaped. Notwithstanding this age, Augereau took part in the campaign of Saxony, and made a valiant stand near Leipzig, defending a wood against superior forces. In 1814 he was intrusted with the command of the French forces in Belgium, when he occupied Lyons, and organized its defence. At first he repulsed them in several combats; but at length, aware of their prodigious superiority of force, as well as of diminishing the discipline of the French, he made a capitula
tion, and retired to the south.

Napoleon considered his conduct on this occasion as little short of treachery; and it is certain that, of all the Marshals, Augereau was the least attached to a master who was so much his junior, and who, by his usurpation, had blotted the ambition of the republican general. Augereau made his peace with the Bourbons, was confirmed in his dignities, and created a peer. On the return of Napoleon in 1815, Augereau kept aloof. Louis XVIII., in a second letter, sent him the painful task was imposed upon him of being one of the coun
cil to try Marshal Ney. His vote of condemnation on his brother soldier is the greatest blot upon Augereau's name in the history of France. His only attempt to survive, being brought to the grave by a drapery in June, 1816.

AUGILA, or AUDJELAH, as the Arabs pronounce it, is a town situated in an oasis within the great Desert of Bara, on the track of the caravans which trade between Cairo and Palmyra. It is a rich oasis, and of great use to the geographers. Renell, in his Geography of Herodotus, places Augila in 30° 36' N. lat., and 22° 46' E. long., 150 miles S.E. of Bara, and 180 W. by N. of Siwa, in the Oasis of Ammon, and 24° 42' E., by N. of Musirin in Fezzan. Herodotus (iv. 182) places Augila ten days jour

ney from the city of the Ammonians; and Hornemann, who travelled from Siwa to Augila in 1797, found the calculation correct. The Oasis of Augila is a depend
cency of the Beylak of Bengazi, which is that province of the regency of Tripoli. It contains two other towns or large villages, besides Augila, namely, Mojabra and Melodila. The people are chiefly employed in the caravan trade; and they have established, of late years, direct communications with the countries of Borno, Bornoo, and Bagherno, without passing through Fezzan. They have also caravans which trade with the port of Bengazi, on the Mediterranean Sea. The country round Augila is well watered, and has extensive gardens. Of the dates of Augila, spoken of with praise by old writers, and especially by Abulfeda, Hornemann makes no mention.

The women of Augila make grey woolen clothes, called Aliya, which is sold in Fezzan. The town of Augila is ill built and dirty. The inhabitants speak, besides Arabic, another language which resembles that of Siwa, of which Hornemann gives a short vocabulary.

AUGITE. The minerals to which this name has been applied present us with some of the most interesting and at the same time most difficult investigations that can fall under the notice of the mineralogist and chemist, and have frequently occupied the attention of the most eminent men of science in those branches of science which relate to their origin. For not only would a thorough knowledge of their constitution, and the relation which they bear to other minera

particulars, particularly to the genus hornblende, tend much to the perfection of the mineralogical system, and to their frequent occurrence in nature, and from their formation into one of the principal ingredients in many porphyrite and trap rocks, such as the syenite, diabase, and schorl-rocks, green-stone, &c., they form a class of bodies of the highest interest. A distinction is made between the minerals which are favourable to the formation of one or other of the species, to the exclusion of the rest, would be likely to afford a safe guide in many geological inquiries. But for the character and formation of these rocks of origin. For such reasons we shall endeavour to lay this subject before our readers in as satisfactory a manner as possible; but in doing so we encounter considerable difficulty, owing to the uncertain state of our own knowledge on many im

M 2
important points, as well as from the various views which have been taken of these minerals by different writers, the effect of which has been the use of the term 'augite' in a more comprehensive sense by some authors than by others. Under these circumstances, we have thought it most advantageous to give an outline of the different views which have originated from the highest authorities, rather than to adopt any one opinion which is not incontrovertibly established: the advantages which we hope to attain by this plan are twofold, namely, to avoid the risk of endeavouring to establish any erroneous opinions, while we attain a more comprehensive view of the whole.

As a little would be learnt by inquiring into the views taken of the genus augite before the time of Werner, it need only be stated, that this mineralogist was the first to divide a large class of minerals, occurring commonly in basalt, lavas, and other volcanic rocks, into two specific terms, to which he applied the names of augite and hornblende. This division was founded on the difference existing between the crystallized forms and structure which, according to the experience up to that time, were never associated with each other. The same division was shortly after adopted by Hauy, who applied to them the names of pyroxene and amphibole, and gave the measurements, determining the oblique rhombohedra prismata, with their most general modifications characteristic of either species, which, however, he had only modified by the later measurements of Rose, Mitscherlich, and Kupffer.

Augite, or pyroxene. Hornblende, or amphibole.

Fig. 1. Fig. 2.

Professor Mohs, however, together with Professor Jameson of Edinburgh, has used the term augite to denote the eighth genus of their respective systems, which consists of the four species designated as follows:

First species. The oblique-edged augites, corresponding with the augite of Werner, and pyroxene of Hauy.

Second species. The straight-edged augite, corresponding to hornblende and amphibole.

Third species. Prismatical augite, containing as sub-species the minerals epidote or zoisite.

Fourth species. Prismatic augite; tabular spar, or Wolastonite.

Berselius, on the contrary, viewing the subject in a chemical point of view, has been induced to use the term augite or pyroxene, hornblende or amphibole, in the same sense as employed by Werner and Hauy. According to him, the augites are composed of one equivalent of the bisulphate of lime, united with one equivalent of the bisulphate of magnesia, which expressed in his chemical notation, on the supposition, however, that silica is formed of one equivalent of oxygen to one of silicium, is

Ca\text{Si}_2^+ + Mg\text{Si}_2^+.

There are several varieties of this genus formed by the removal of the magnesia or lime, which are replaced either by one or both of the isomorphous substances— the protode of iron, and protode of manganese. Of these the following are the principal:

1. Disopasite, which may be considered as the type of the augite genus, is readily recognized by the form of its crystal given in fig. 1, and by the direction of its four nearest planes, the most perfect corresponding with the faces M, those in the direction of r and i being less easily obtained; and by its pale-green, or greyish-white colour, and vitreous lustre. Its hardness is 5'5, and its specific gravity is 3'299. Alone before the blowpipe it melts into a colourless, semi-transparent glass; with borax, very readily into a transparent glass. Its chemical constitution is expressed by the formula given above, as will be seen by the following analysis of a variety from Tammare by Bonsdorff:

Silica 54'83
Lime 24'76
Alumina 9'38
Magnesia 18'55
Loss by heating 0'32
Specific gravity 3'299

Several varieties, little differing from the above, are called backalite and fassaithe, names indicative of their locality.

2. Hedenbergite, whose constitution may be stated by the formula C\text{Si}_2^+ + F\text{Si}_2^+, as may be seen by the analysis of G. Rose of a variety from Lunenberg, who obtained of Silica 49'01
Lime 20'67
Protode of iron 26'66
Protode of manganese with magnesia 2'98
Specific gravity 3'90

It is of a dark-green colour, sometimes nearly black.

3. Sasalite, those varieties in which the magnesia is only in part replaced by protode of iron, and whose composition G. Rose expresses by

Ca\text{Si}_2^+ + Mg\text{Si}_2^+

Berselius gives the formula,

(C\text{Si}_2^+ + Fe\text{Si}_2^+) + 2 (Ca\text{Si}_2^+ + Mg\text{Si}_2^+),

as expressing the constitution of a variety from Bjornmore, in Sweden, which would therefore be one equivalent of hedenbergite united with two of disopasite. He calls it malakolith. (See "Abhandlung der Naturkunde," by Berselius.)

4. Disopasite: the constitution of this variety is expressed, on the authority of Berselius, by Fe\text{Si}_2^+ + 3 Mg\text{Si}_2^+, of G. Rose, by Mg\text{Si}_2^+ + Ca\text{Si}_2^+Fe;

Mg of F. Kobell, by Ca\text{Si}_2^+.Mn

The difference in the analysis by Köbler of two specimens, the first from Tuscany, the second from Utenthal in the Tyrol, would perhaps rather indicate the latter:

Silica 53'29
Lime 19'00
Magnesia 14'01
Protode of iron 8'47
Protode of manganese 0'38
Alumina 2'47
Water 1'77
Specific gravity 10'02

This variety is characterized by its mother-of-pearl lustre, and by its possessing the most perfect cleavage in the direction of the diagonal of the prism. It is seldom found in perfect crystals. Its most general colour is a bronze yellow.

5. Hypersthene, which is very similar in its general appearance and characters to disopasite, has the following constitution: Fe\text{Si}_2^+ + Mg\text{Si}_2^+.

Both of the last-mentioned varieties may be distinguished from the former, as well as from each other, by means of the blowpipe, and by attending to the following characters as stated by Berselius:

Disopasite alone in a matrix decomposes, becomes of a lighter colour, and gives off a little water.

On charcoal it is with difficulty melted on the edges into a grey mass.

With borax it is very difficultly fused into a clear glass, somewhat coloured by the protode of iron.
Decomposed by the phosphate of soda and ammonia, with the development of the silicate.

Hypersthene, on the contrary, when heated alone in the manner of augite, becomes a little waxy, and forms a greasy opaque glass, as is also the case when heated with beryll.

The salt of phosphorus does not apparently decompose it, but the mineral at first becomes rounded on the edges, and may at length be entirely fused.

The structure also deserves particular attention, the cleavage planes in hypersthene being perfect, both in the direction of the faces r and s, the latter of which are obtained in duality with very great difficulty.

We have now described the various species generally considered as comprehended within the genus augite or pyroxene; but Professor Gustave Rose has published a paper in Physique et Chimie, Brussels, in the year 1831, the object of which is to prove the necessity of uniting augite and hornblende (pyroxene and amphibole) under the same genus. His arguments for this union are the following:—first, that the two prisms of augite and hornblende, however different in appearance, admit of being derived one from the other, according to the laws observed to connect the crystallographic forms of varieties of the same genus in other minerals. To show this, let the accompanying parallelogram, whose semi-diagonals are a and b, represent the horizontal section of the prism of augite; since the whole angle of this prism at A is 87° 42′, a is the tangent of an angle of 43° 32′; if this tangent be doubled the corresponding angle will be found to be 62° 15′ 25″, the double giving 124° 30′ 50″, an angle agreeing most closely with 134° 21′, the angle obtained by Mitscherlich in a species of hornblende when measured by Wollaston's reflecting goniometer. The larger parallelogram, therefore, by doubling the diagonal a, is the horizontal section of the prism of hornblende.

A similar relation is also approximately true for the inclination of the faces r and s in augite and r in hornblende; for if the angle 120° 57′ of augite be halved, and its tangent doubled, the corresponding angle is 74° 11′ 31″, and by doubling this we obtain 148° 22′ 42″, not much differing from 148° 23′, as found between r in hornblende of Vesuvius by Rose.

His argument drawn from the chemical constitution of these minerals is by no means so satisfactory; for though in hornblende we find a series of bisilicates of the same bases, and as it were running parallel with those already described as augites [see HORNBLende], the circumstance observed by Bunsen, that all the varieties of hornblende contain fluorine, while G. Rose has been unable to detect that element in augite, weakens the connexion between these minerals, and renders the determination of what part the fluorine acts in their constitution a matter of considerable doubt, and even the object of the solution of the truth of the law is therefore somewhat doubtful, and the difficulty of determining what is the action of the alumina, which occurs in considerable quantity in some hornblendes, prevent us from forming any opinion from the results of chemical analysis.

The observations of Mitscherlich, made on different rocks of the Urals, of the Ural Mountains, tend to prove the existence of the connexion between the forms of augite and hornblende which is essential to their constituting one genus, in a more satisfactory manner than any remark hitherto made. He discovered a soft greenish green-stone, near the village of Matesovka, which is situated north of Katherinenburg, and on the road to Newian, and also at the gold-washings of Cavidinski, near Misak, in a green-stone somewhat harder and darker than the former, imbedded crystals of the form of augite, but not its cleavage planes, these last being found to coincide with those of hornblende. This mineral was therefore either hornblende in the form of augite, or augite with the cleavage planes of hornblende.

At the village of Mualakajew, near Misak, he discovered a still more interesting fact. Here he found a green-stone similar to that last described. They were abundant, and possessed the form of augite: the smaller crystals had cleavage planes parallel to the sides of the prism of hornblende, and were similar in their appearance and colour to those obtained in Cavidinski. The larger crystals, however, possessed a kernel of a grass-green colour, and of a lighter tint and greater lustre than the exterior. This kernel differed from the darker exterior portion of the crystal, the latter giving the clear green stone, the former presented those of augite, with faces sufficiently bright and perfect to admit of measurement by the reflecting goniometer.

The observations of Mitscherlich and Berthier on the formation of augite as an artificial product are so interesting in themselves, and throw so much light on the nature of augite in general, and on those crystals we have just described, for which Rose proposes the name of uraite, that we cannot omit to notice them in this place. Mitscherlich has observed that the former possessed the form, structure, and chemical composition of certain minerals found in nature. From this source he has obtained upwards of forty varieties:—and among these, specimens possessing the form and structure of augite is very frequently found, and with ease. Guided by these observations, a mixture of silicates, lime, and magnesia in the proportion indicated by the formula $Ca\ Si\ + Mg\ Si$ was submitted to fusion in the porcelain ovens of Sèvres, near Paris. On examination, the mass was found to have been converted into a green-stone possessing cleavage planes corresponding with those of augite, and a hollow formed in the centre from the contraction in cooling contained crystals of the form of Fig. 1. By these processes they failed in obtaining crystals either of the form or structure of hornblende. As the nearest place to refer to the other results obtained by those chemists, we must refer our reader to the original papers in the Ann. de Chimie et de Physique, tom. 34, and the Ann. des Mines, tom. 9, particularly those who may be interested in mettallurgical processes.

Professor G. Rose, in accounting for this production of augite to the exclusion of hornblende, was led to consider that it was not the absence of the fluorine, or any error in the experiments, which caused the latter to be excluded, but the rapidity with which the crystals were obtained. This he fully confirmed by the following experiments:—a light-green variety of hornblende, the stahlblaste of the Germans, from Zillerthal in the Tyrol, was submitted to fusion in a porcelain crucible in a current of air. It was completely fused, and in cooling had formed fibrous tufts of dark crystals, which, however, admitted of measurement by Wollaston's goniometer, when the angles were found to correspond with those of augite. A specimen of augite, of the same locality as that which was cooled into a dark mass, but regained its former structure.

We may therefore consider it to be demonstrated that augite is formed whenever the process of cooling, and consequently of crystallization, is rapid; and hornblende, when it is conducted more slowly. Many circumstances confirm this view:—the uraites of Rose appear to be its natural consequence; for, as by the laws of caloric we know that the quantity of heat lost during equal portions of time varies with the temperature of the exterior atmosphere, the crystal alone must have crystallized under a more gradual loss of heat than the interior, while at the same time the temperature would be maintained by the specific heat given out by the parts first consolidated. The general occurrences of augite and hornblende in lavas of which they are found associated, affords another argument in favour of this supposition; for augite is usually met with in syenite, trachyte, and lava, accompanied by quartz, feldspar, albite, &c., minerals which decidedly require a slow process of cooling for their formation; on the contrary, augite occurs in basalt and lava with olivine, which Mitscherlich has recognized in the scoriae of various foundries, and which is therefore formed by a process of rapid cooling.

We are thus able to account for H. von Buch's remark in his Geology of Norway, that the layers which constitute the feldspars have hornblende, but no augite.

Induced by these circumstances, Rose, in a tabular view
of the minerals which he has added to his Elements of Crystallography, published at Berlin in 1833, has united into one genus the following species.

1. Diopside. Ca $Fe_{2}Si_2 + Mg Si_2$.
2. Sahlitte. Ca $Si_2 + Mg Fe$.
3. Heldebolgenite. Ca $Si + Fe Si_2$.
4. Basaltic augite. Ca, Mg, Fe, Al, Si.
5. Rothbraunstein. Mn Si.
6. Arcomite. 3 Na Si + 2 Fe Si.
7. Diagite. Mg $Si_2 + Ca$.
8. Biotite. Mg $Si_2$.
9. Hypersthene. Mg $Si_2 + Fe Si$.
10. Uralite.
11. Tremolite. Ca $Si_2 + 3 Mg Si$.
12. Anthophilit. $Fe Si_2 + 9 Mg Si$.
13. Strahlstein. Ca, Mg, Fe, Al, Si.

Basaltic hornblende Ca, Mg, Fe, Al, Si.

AUGMENTATION, in music of the olden time, was, as Master Morley tells us, 'an increasing of the value of the notes above their common and essential value,' and indicated by a sign. It is unnecessary to dilate on this term, which, as well as many others of the same date, has long been known to musical and theatrical phantasies.

AUGSBURG, the capital of the Bavarian circle of the Upper Danube, stands on a gentle eminence in an agreeable and fertile country, near the influx of the Wertach into the Lech, and by the branches of the Danube rivers, its $4^\circ 41'$ N. lat. and $10^\circ 54'$ E. long. It lies 1460 feet above the level of the ocean, about forty miles N.W. of Munich; and both from its position and the number of main roads which traverse it, has long formed one of the central points of the internal commerce of Germany. It is divided into three quarters—upper, central, and lower towns, independently of the suburb of St. James, which lies outside of the walls; it is intersected by four canals, which supply the mills and manufactures of the town with water. The outer boundary of the gloria has been converted into delightful walks, along which the circuit of the city may be made in a couple of hours; and within the gloria runs a wall flanked with towers, bulwarks, and gates, with nineteen principal and six minor entrances. The streets, with few exceptions, are narrow and irregularly built, and the pavement adjoining the feet, being composed of small flints though its disposition in a mosaic form is not unpleasant to the eye. The building of the town is of the most modern, improved by a variety of handsome buildings and squares, and embellished, though it can scarcely be said to be embellished, by the manner in which the generality of the houses are painted with stripes, either green, red, or yellow. The eye is always separated by white. Every street and lane is provided with reservoirs of water for the use of the adjoining houses, and a separate work for the purpose of enforcing the water into them.

The Town Hall in Augsburg is the town-hall, which was built by Hall in the beginning of the seventeenth century, and contains the 'Golden Hall, perhaps the most splendid apartment in Germany, its length being 116, its breadth 57, and its height 52 feet; it was used for the election of two kings of the Romans, and was decorated at a great expense with painted ceilings and frescoes, by Krager and Rottenhammer, the former of whom was elevated by the gratitude of his fellow citizens to the Burgmeister's chair. This hall, with the four royal apartments adjoining, has since been appropriated to the purpose of a picture-gallery. Among the thousand paintings which it contains (the whole arranged in chronological order), it is particularly rich in specimens of the German school. Kranach, Samsi, and Daubitz; Albert Durer's 'Experiment the First', Krager's 'Last Judgment', and Rottenhammer's 'River Gods of Augsburg, stand at the head of the series; but few will feel disposed to pick even such as these to Guido's 'Sleeping Infant'; Thien's 'Venus holding a Mirror to Cupid,' or Parmigiano's 'Madonna.' The collection of models from the antique, which occupy another apartment in the town-hall, is less in character with its externally grand appearance; public salutes, than a very complete and well-arranged collection of another description, containing the archives of the town. Adjoining this fine structure is the 'Perach Tower,' which is ascended by a staircase of 300 steps; and the 'Arsenal,' a series of 'Bridges of Weights.' The Augensburg noble group, representing 'the Demon of War vanquished by Michael the Archangel,' the work of Reval von Rain, the Bavarian sculptor. The episcopal palace (the town being still the seat of a bishop) is situated close to the cathedral; it was under this roof that Louis of Bavaria discredited his married with Cajetan, the papal legate, in the year 1518; and under the same roof, on the memorable 25th June, 1530, this great reformer presented the corner-stone of the Lutheran faith, commonly called the Augsburg Confession, to the emperor Charles the Fifth. Augsburg was the place from which that sovereign, urged by the undaunted bearing of the protestants of Germany, proclaimed the 'Interim,' or religious armistice, which recognised them as a distinct and independent community. Augustinus, an ancient and learned, who witnessed the signature of the treaty of 1533, which sealed the sword of religious strife, and left the protestants in the full enjoyment of their dearly-purchased immunities. The venerable walls of this palace were, in 1807, converted into schools for the general education of the people, and divided into apartmentes for the occasional residence of royalty. Among other conspicuous buildings are the 'Hole, a handsomely commercial mart and stockhouse, which has a machine for weighing loaded wagons and merchandise on the spot. The great and partially used public library, which is rich in Greek books and manuscripts; the Franciscan academy of arts; the school of the arts; and the 'Cathedral,' which was built in the fifteenth century and the upper part in the sixteenth, which is the third tower or the church, the first being the tower of the tenth. This edifice is 350 feet in length, and was built in 1183, and the side aisles are fitted up with four and twenty chapels, independently of several pictorial embellishments of some importance, where shrines with statues of saints may be seen from the choir; there is also a side door of bronze, carved with figures and emblems, dating from the year 1047. A visit to St. Ulrich's church, which is 310 feet in length and 94 in width, will be amply repaid by the prospect from its lofty steeples (which is 158 feet high), the building of which is in long (in the year 1519) by two brothers of the Fugger family, who, in the year 1558, the founders of more than one cardiom of the present day; it is a town of itself, situated in the suburbs of St. James, has its own church, consists of three streets and as many lanes, has three gates, and contains 1070 buildings, let out to indigent natives of the town, at a rent of two shillings per annum. A philanthropist of our own times, Lawton, a book-seller, a resident of Augsburg, in his 'good work' of commercial manufacture: first, by establishing a school of industry for 100 poor children and orphans of this his native town, in 1813, and then, two years afterwards, by establishing a school with the assistance of the old Dominican monastery for the reception and partial maintenance and employment of sixty-three aged males, forty-seven operatives, and seventy-six children, who are educated on the Lancasterian system. To these institutions may be added the one open to the instruction and a book for savings. An equally liberal and enlightened spirit has animated the more affluent classes in making provision for the instruction of their humble fellow citizens; every religious community in the town has schools of its own, the two or three week days schools attended by nearly 2000 children, the Sunday schools by upwards of a thousand, and the three female schools of industry by four hundred. Between five and six hundred youths of superior
rank are educated in the Protestant gymnasium and the
same is true of the two endowed
schools for females, the one founded by Barbara von Stal-
ternchen, who died in 1605, for protestants, and the other
conducted by the English sisterhood, for Catholics; as
well as a polytechnic institution.

Among the public embellishments of the town we
must not omit to notice the Grand Parade in front of the
cathedral; Maximilian-square, next to St. Ulrich's church; and
several open areas, which are adorned with handsome foun-
tains: the general character of these embellishments shows
the care of the people for the welfare of the Augsburg
and the Italian states. In the better days of Augsburg,
indeed, when the munificence of its citizens was lavish,
becoming the fine arts, and its native school produced
such men as Ruggendas, Hocher, Holzer, Riegler, and Frey,
the fronts of every respectable dwelling show the
glories of the pencil, and the whole Scriptures might be
studied in fresco illustrations out of doors. Not only the
fine arts, but science and the belles-lettres found patrons
in the merchants of Augsburg: their cabinets and libraries
were used with their gardens and mansions: the first tulip
brought back by the banking and exchange operations, and the transit
of the goods and services between the totality of the
population. The sale of the wines of Italy, Switzerland, and the south of
Germany, and still enjoys repute for its plate and jewelry.
It has above 200 mercantile establishments, and an annual
export of 2,000,000 marks, making it one of the leading centers of trade
in bills and merchandise. The linen and cotton
manufactures have decreased, within the last forty
years, from 1200 to scarcely more than 200 looms; the woollen
and linen-yarn spannersies, which formerly circulated nearly
30,000 yards a year, have now altogether disappeared, but retain a
comparative insignificance; but the manufacture of patch
work, and particularly of plain and coloured paper, continues
to thrive. Augsburg has indeed strong claims to the merit of
having invented the art of making paper from rags, which
came into use here as early as three years 1336–8, at which
the town has always been famous. Its machinery, too, from their experience in wood-cutting
and in stamping cards in colours, had acquired that species of
skill which rendered the process of printing an easy task
for the Augsburg presses, for which they have always
envied themselves of Guttenberg's invention. Latin Bibles,
bearing the date 1466, and a legend printed in 1471, both from
the Augsburg press, are sufficient evidence of the fact
that in the sixteenth century the Augsburg press,
produced a great variety of works, and that the Augsburg
presses were the largest publishers in Germany. The
artists of Augsburg are also famous for their engravings, and
charts are engraved and circulated throughout
Germany from Augsburg; and the present Baron
Cotta's father, the proprietor of the celebrated Allge-
meine Zeitung, and the founder of two popular periodical
works, the Morgenblatt and Abendblatt, selected Augs-
burg for the establishment of one of his four extensive
presses, which is set in motion by one of Bolton's steam-
engines.

This press was constructed by Körnig, the finest
water-grinder in Germany, and the largest press
for the production of sixty thousand impressions per
hour. The machine at Augsburg, which consists of three
presses, throws off from five to ten thousand copies of the
Allgemeine Zeitung in the course of four or five hours, and,
whereas, with the press of sixty boys, the work of sixty
pressmen; and it is estimated that the work is done in
one month for 24,000 marks. No branch of industry, however, is in a more
thriving state than the woollen manufactures of this town,
which employ nearly six hundred looms. The wool is
usually supplied from the Lochem, which set 150 wheels in motion,
and are traversed by 220 bridges and crossings. Augsburg
produces about eighty tons of beet-root sugar per annum;
and manufactures mathematical and musical instruments,
paper-hangings, print, paper, and candles, and a variety
of articles of luxury. Its population at the present
day amounts to about 35,000, of whom rather more than one-third are protestants;
but it was much greater in former times, for the yearly average of births, which are at present
under 900, was upwards of 2500 in the beginning of
the sixteenth century; even in the seventeenth they were
above 1000; and in the eighteenth, towards the end of the eighteenth century, they
had increased again to nearly 1300; from which it is
difficult to say whether they have since gradually declined to their present average. We
may add, that at the close of the sixteenth century the
number of its inhabitants is stated to have been 80,000.

The emperor Augustus passed through the city about four
years before the Christian era, to which he gave the name of 'Augusta Vindelicorum' (the city of the Vindis in the
Lochem); and hence comes the name of Augsburg. There is
nothing to note in its subsequent fortunes until the fifth cen-
tury AD, when it was occupied by the Huns. Under
the dominion of the Frankish sovereigns, and in 706 it
was almost raised to the ground during the war which raged
between Charlemagne and Tassilo of Bavaria. Upon
the dissolution of the Frankish monarchy, Augsburg fell under the sway of the dukes of Tyrol; but growing rich by
the staple commerce and manufactures, it gradually shook off all external
control, purchased its independence of its episcopal
sovereigns, was recognized as a free state by the German
emperors, and retained its rank as a free imperial city for
upwards of five hundred years—namely, from 1247 to 1705.

From about the twelfth until the sixteenth century, it was a
leading member of the famous Swabian Confederacy, which
included Ratisbon, Nuremberg, Constance, and other com-
monwealths of the Swabian League. Augsburg was
the chief medium of intercourse between the north and
south of Europe and the Levant, and supplied the markets of
northern Germany, Russia, Poland, and other countries,
with woollens and linens; and it retained its mercantile
eminence until the beginning of the eighteenth century.

In 1450, the Spaniards and Portuguese, at the close of the
fifteenth century, opened new channels to commercial enterprise.
It was at this period of its highest prosperity that the single
merchants established the free trade of Augsburg. Profiting
by the successes of Philip II., and enabled him to carry
out the sanguinary warfare carried on by the League in
France, and by his own generals in the Low Countries.
Previously to these times (namely, in the year 1365) the
patrician order was still in its infancy, and the
assistance of the patricians and their relatives in
the town, which was then the seat of the League,
was the chief medium of intercourse between the north and
south of Europe and the Levant, and supplied the markets of
northern Germany, Russia, Poland, and other countries,
with woollens and linens; and it retained its mercantile
eminence until the beginning of the eighteenth century.

In this eighteenth century, the use of
Frankfurt on the Main inflicted a blow on the prosperity of
the town from which it has never recovered. Augsburg
indeed has ceased to be a place of importance in the cir-
culation of exchange in Europe, and Frankfurt is now the
place of business for the exchange of money-market.
The city of Augsburg was occupied by the French
in August (the date we are not acquainted with), that an
Augsburg merchant might, at any time between the ac-
ceptance and the maturity of a bill drawn on him from any
European sign place, obtain the use of the Augsburg
acceptance was not binding. Whether this law now exists
we are not quite sure, nor can we undertake to say how
much of the decline of the commerce of Augsburg is due to
it. Under the settlement of Germany, in 1609, Augsburg
was recognized as one of the six Hanse towns, which were
declared independent of the German empire; but three
years afterwards it was merged into the dominions of Bavaria,
under the treaty of Passau; and in March, 1806, it was
surrendered accordingly into his Bavarian majesty's hands,
with the French general René, acting under the orders of
Napoleon Bonaparte.

Augsburg is the birth-place of Holbein, Holl, and other
eminent artists. The gardens and places of public resort
around it, as well as the rides and walks in its delightful
suburbs, afford the most agreeable and healthy
residences. As a town, it never entirely
recovered from the injuries of the Thirty Years' War, which
were sustained, according to its situation in the affairs of Saxony, after which two copies of the
Confession, one in German and the other in Latin, were
delivered to the Emperor, bearing the signatures of John
Elector of Saxony, George Marquis of Brandenburg
Ernest Duke of Luneburg, Philip Landgrave of Hesse

AUG 97
AUG
and Wolfgang, Prince of Anhalt; besides those of the five towns of Nuremberg, and other cities. The Confession was immediately afterwards printed, and, being translated into various languages, was spread over Europe. It has ever since continued to be the rule of the Lutheran Church in matters of faith. It consists of forty-eight articles, twenty-five of which were the same as those of the Augsburg Confession, but with some alterations. The Roman Church, and the other Swiss and French reformers did not subscribe to the Confession of Augsburg, as they differed from it on several points, particularly about the Lord's Supper. The style of the Confession is clear and fluent, and it was published in four octavo sheets of thirty-two pages. It was a very important document, as it constituted one of the books of authority of the Lutherans which were published, including the Confession, at Dresden, in 1536. Ernest Solomon Cyprian has written a good history of the Augsburg Confession, and Weber in a Commentationes Historicae, published by Luther in the year 1535. Kirchengeschichte, and Moseheim's Ecclesiastical History, and Notes, by Dr. Murdoch.}

AUGSBURG GAZETTE. (See Allermann Zeitung.)

AUGUST, a village in the canton of Basel, in Switzerland, built on part of the ground occupied by the ancient Augusta Rauriscorum, a Roman colony under the empire. The remains still existing are not very considerable; they were discovered by Louis de Jaucourt, in his Asia Antiqua Illustrata. Medals of Roman emperors have been found in abundance in the ground. August is situated on the left or southern bank of the Rhine, six miles S.E. of Basel.

AUGUR. The earliest inhabitants of Italy, like all rude nations, imagined that they saw in every unusual occurrence a manifestation of the will of heaven. The power of interpreting the signs thus furnished by the gods was thought to depend upon a peculiar talent conferred upon the favoured mortal from his birth, but a certain discipline was necessary to maintain it and enable it to be fully developed. A superstition so deeply seated in the minds of the people was turned to account in the political constitution of Rome, by the establishment of a college of augurs, whose duty it was on all occasions of importance to ascertain, by the Curia or public or the gods, whether the nature, by certain arts to ascertain and report the pleasure or displeasure of the gods. Romulus himself was said to have been skilled in the arts of divination from his earliest youth, and at the foundation of the city the claims of the rival brothers were decided by augury. The story of Tanaquil, of Servius Tullius, and still more the contest between the elder Tarquin and Attus Naxios, added additional evidence of the peculiar nature of this Roman superstitious.

The institution of the college of augurs may be referred to the very earliest period of Roman history; for the assertion of Livy (v. 18, and iv. 4), that there were no augurs in the reign of Romulus, is not merely opposed to the general tenor of the history of Rome, but directly contradicted by Cicero, in his De Legibus, (lib. ii. cap. 83), in which he says there were no augurs in the time of Romulus. It has been said, and it is generally believed, that the college was again differently reported. Cicero himself was an augur, says that Romulus associated three others with himself, and that Numa added two. (Idem 14.) Livy reports that in the opinion of the augurs of the time, the number of the college was related to the number of the people and tribes, and that consequently there must have been at the beginning at three or six; so that each of the three tribes should have either one or two augurs. On the other hand we shall see that, according to the ancient laws, Rome that, prior to the completion of the augurs, were the supposed number of the college, as recommended to the senators, to fill up the vacancy in any of the thirty-five tribes chosen by lot should, by a majority of the votes of the said seventeen tribes, nominate a successor, and if there should be the same number chosen, the elder in the election of the chief pontiff, and therefore, most probably, that of the other priests. (Deus, liv. 33.) We have already seen that the emperor had the privilege of nominating augurs and determining their number.

The college and superintendence which thus constituted the supposed science of the augurs would be tedious to enumerate; but that which especially characterized the augural office was the peculiar power of ascertaining the will of the gods, not only by means selected from the superior science of augury, but from the many several arts, which was exercised at some elevated spot, on which he set with his head veiled and his face turned towards some place...
cular quarter of the heavens, varying perhaps according to the occasion; for the accounts differ so much that, while Livy says it was the east, we have the authority of Varro for the south, and Pliny for the west. Then the augur, with the help of his crook, free from knots, called a lituus, marked off a certain portion of the heavens and of the earth, within which his observations were to be made, and again divided this portion into two parts—the right and left—and gave the auspices on the augury of the auspices, called a templum, and the steadfast observation of the augur directed upon it may probably account for the meaning of the Latin word con-tempula-riri, to contemplate, which has been adopted into our own language. The gods then signified their approbation by raising their right hand to the left, and the augury was complete. For some purposes the whole circumference of the heavens, together with the corresponding parts of the earth, were divided, according to their longitude and latitude, into twelve parts, and others parallel to these. (Liv. i. 18, Dionys. ii. 70, and the appendix to the translation of Niebulur, vol. ii.) So prominent a place did the feathery creation hold as the interpreters of the divine will, that not, the Latin for bird, is the chief element in the term augur, as it is also in the nearly equivalent word auspex (auspex). In the latter, the second syllable is deduced from spec, look, so that the word signifies bird-watcher. The second element of the word augur does not appear as a separate English word; it resembles in the Latin language. We have called the terms nearly equivalent, and if Plutarch's authority had been sufficient (Romana. c. 72), we might have dropped the qualifying adverb. But a Roman antiquary would have pointed out many examples of the use of imperfect forms, inasmuch as these is, that the leading magistrates of Rome possessed the auspices (Cic. De Leg. iii. 3) by virtue of their office, while the term augurium never refers to any other than an augur. The name auspex does not appear to have been in early times a technical word, and indeed was but rarely employed; but the derivatives from it were frequently used, and applied with considerable latitude to the augurs as well as to the magistrates. The objects of the auspices and augurium were, to some extent, similar; but there was a difference. The former was intended to designate men of a similar nature. Moreover, all legal disputes about the auspices of the magistrates seem to have been referred to the augurs. Under all these circumstances we shall not attempt to draw a very nice line between them.

There were, as we have already stated, besides the movements of birds, a variety of other occurrences in the physical world which, as expressive of the will of heaven, came under the enunciation of the auspices. We shall not attempt to catalogue them here, for the formation of man may take; but absurd as these forms may have been, the political power of the auspices was most substantial. The election of a king, a consul, a dictator, a praetor, a censors, the Senate, the Sibyl, the flamenc, &c., were all void unless the auspices were favourable. A general could not cross the pomerium, or sacred boundary of Rome, the frontier of the state, or even a river, without the sanction of his birds. To engage an enemy in defiance of these interpreters of the will of heaven was to entail present or future defeat. In the assignment of public lands the science of the augur was required to mark out the different allotments. Among the patricians, the presence of an augur became a legal object to render valid many of the proceedings of private life, as marriage and adoption; and the same political body found in the auspices a powerful argument against the rising claims of the plebeians. The auspices, they said, were their peculiar privilege, and as such they could not be abridged; without such divine assistance, there was an insuperable bar to the election of plebeians. Of the three comitia, or legislative assemblies, that of the curiae, being the special assembly of the patricians, was of course subject to the auspices, and the same body ordaining the qualifications of the centuries; but that of the tribes was free from such control. Of the two last (for the comitia curiata became obsolete) the assembly of the centuries was the most important, and hierarchically above the assembly of the tribes; and so complete was the veto of an augur in this assembly, that if he but heard a clap of thunder, nay, if he but saw and he had heard one, and that falsely, the proceedings of the assembly were void. Such was the power of the augurs. And it is strengthened by the law that a man once created an augur was an augur for life, no matter what crimes he might commit. (Plin. Ep. iv. 8; Plutarch, Romana, 97.) On the pecuniary advantages of the office there are no very definite statements. That they received money in some shape from the public treasury is indeed a widely stated fact. (Liv. iii. 5.) But it is also said that Cæsar has made a bad pun at their expense, charging them with extracting aurum (gold) from the aureus (ears) of those who believed in them; and the public money may perhaps be traced in the buildings of the temple. But this was not the popular election, which were celebrated in the annals of Roman antiquity. (Verg. Ecl. ad Fam. vii. 16; Varro, R. R. iii. 6; Plin. H. N. x. 23.) In the latter years of the republic many of the duties of the augurs were performed in the most lax manner. At the age of twenty, of the nunciature, or the auspices, for speaking of his own time, the ceremony is a mere shadow of what it was. The candidate takes his seat, rises, repeats a set prayer in the open air, an augur then declares he hears thunder on the left, when in fact there is none, and the candidate forthwith enters upon his magistracy.

AUGUST. The month of August was originally called Sextiliis, being the sixth month in the Alban or Latin calendar; and this name, as is stated, it retained in the calendars of Romulus, Numa Pompilius, and Julius Caesar. Since Numa's reform, however, it has held only the eighth place in the series of months. In the Alban calendar, Sextiliis consisted of twenty-eight days; in that of Romulus, twenty-nine; in that of Numa, thirty; in that of Augustus, thirty-one, and Caesar restored it to thirty; and Augustus Caesar, from whom it derived its new name of August, extended the number of days to thirty-one, which has continued ever since. It was originally proposed that September should bear the name of Augustus, but for the reasons which influenced the decree of the Senate detailed in Macrobius, in his Saturnalia (edit. Bipont. i. 261), viz., that since it was in this month that the Emperor Caesar Augustus had entered upon his first consulship—had celebrated three triumphs in the city—had received the allegiance of the soldiers who had been enrolled under him, and had himself invaded and brought to civil war—it appeared that it was, and had been, proper to the empire; and the Senate therefore ordained that Sextiliis should henceforward bear the name of Augustus.

Gassendi; (Kalend. Romanum, apud Graev. viii., col. 164) says that Commodus wished to have had the month Sextiliis called by his own name.

The Flemings and Germans have adopted the word August for Harvest; Ougst maand is the harvest-month. (Cf. Cervantes, Don Quar. 3, 30, 76, 82.) Mr. Junius remarks that if the processus of man may take; but absurd as these forms may have been, the political power of the auspices was most substantial. The election of a king, a consul, a dictator, a praetor, a censor, a plebeian curule, the decision of the Sibyl; the Sibyl's prediction; the Flamens, &c., were all void unless the auspices were favourable. A general could not cross the pomerium, or sacred boundary of Rome, the frontier of the state, or even a river, without the sanction of his birds. To engage an enemy in defiance of these interpreters of the will of heaven was to entail present or future defeat. In the assignment of public lands the science of the augur was required to mark out the different allotments. Among the patricians, the presence of an augur became a legal object to render valid many of the proceedings of private life, as marriage and adoption; and the same political body found in the auspices a powerful argument against the rising claims of the plebeians. The auspices, they said, were their peculiar privilege, and as such they could not be abridged; without such divine assistance, there was an insuperable bar to the election of plebeians. Of the three comitia, or legislative assemblies, that of the curiae, being the special assembly of the patricians, was of course subject to the auspices, and the same body ordaining the qualifications of the centuries; but that of the tribes was free from such control. Of the two last (for the comitia curiata became obsolete) the assembly of the centuries was the most important, and hierarchically above the assembly of the tribes; and so complete was the veto of an augur in this assembly, that if he but heard a clap of thunder, nay, if he but saw and he had heard one, and that falsely, the proceedings of the assembly were void. Such was the power of the augurs. And it is strengthened by the law that a man once created an augur was an augur for life, no matter how...
now Augs-burg, sometimes written Augsburg; Caesar-Augusta, now Bar-rogus. Nearly similar to these is Augusto dunum, formerly Bibere, the capital of the Augusti, and now a town with 8000 inhabitants, as in Augusta Verona and Augusta Asturica, now Astorga. The Greek cities pursued the same course of flattery in the use of the equivalent Greek term Sebast. Thus we find a Sebast in Phrygia (see Hist of Coele-Syria). The idea of the city and the emperor is the same as in the case of the Tescagges, probably no other than Amyntor, which was intimately connected with Augustus (Coin); Sebastopolis in the district of Pontus, called Phanauros (Brahe), and Sebasto or Sebast, on the upper streams of the Danube, were cities of the late Augustus. Sebastopolis is navigable from its mouth up to Augusta, for vessels of 100 tons. There is at Augusta a fine bridge across the Kameboe. The population of Augusta was 3,990 in 1830, but must have increased since then. (American Almanac for 1832.)

AUGUSTA, a town of Maine in the U.S. on the river Kennebec, 56 miles N.E. of Portland, in 44° 17' N. lat. and 69° 59' W. long. It is a thriving town, and has, by an act of the state legislature, been made the seat of the state general court. It contains three churches, called the Medical College of Georgia, with six professors; a college under the direction of Methodists, with six instructors, sixty alumni, seventy-five students, and a library of 5,000 volumes; a city hall, a county jail, and a hospital, and is a place of public worship. There was a great fire in April, 1829, which destroyed a considerable part of the town. Augusta is ninety miles by the road from Milledgeville, the seat of the state government of Georgia. (Stuart’s Three Years in North America, 1834.)

AUGUSTA HISTORIA, the name given to a series of Roman historians, or rather biographers, who wrote the lives of the Emperors from the accession of Hadrian to the death of Carus, the immediate predecessor of Diocletian; these lives comprise a period of 167 years of the history of the Roman Empire. They may be considered as a continuation of Suetonius’s Twelve Caesars, except that between Domitian the last in Suetonius, and Hadrian the first in the Augustan his first biographical work, the intervening years are not included in either of the two series. We know from Lampadius that four historians had written Trajan’s biography, Marcus Maximus, Fabius Marcellinus, Aurelius Verus, and Sextus Severus; all of whom we afterwards hear of.

The writers generally included in the collections of the Historia Augusta are six in number; they lived under Diocletian and his successors Constantine and Constantius. They are: 1. Albus Spartanus, who wrote the lives of Hadrian, and his colleague Albus Verus; of Decebalus, of Septimus Severus, Pescennius Niger, Antoninus Caracalla, and Antoninus Geta. Spartanus dedicated the first four to the emperor Diocletian, and he states in his life of Albus Verus, that his intention was to write the lives of all the emperors from the great dictator Julius Caesar, and of all those, whether they were the sons or relatives of the emperors, or were by them adopted, had received the title of Caesar. It appears from the beginning of his Life of Verus, that he lived under Carus, the last of the last before Hadrian, which however have been lost. 2. Julius Capitolesinus is the second writer in the series. He wrote the lives of Antoninus Pius, of Marcus Aurelius, and of the second Verus. These he dedicated to Diocletian. He also wrote the Life of Caracalla, of Decebalus, of all the two Maximini, of the three Gordians, and of Maximinus and Balbinus. He appears to have written also others, which are lost. 3. Elbus Lampadius, to whom are attributed the lives of Commodus, Antoninus Pius, and Caracalla. Of his two last are dedicated to Constantine. There are, however, considerable doubts whether some, if not the whole of these, should be attributed to Spartanus; and both G. Voss and Feberbrum seem to think it not unlikely that Albus Spartanus and Elbus Lampadius are one and the same man. (See literary notices prefixed to the Bipont edition of the Historia Augusta.) 4. Valentinus Gallicanus, a senator of Rome, of whom we have only the life of Avitus Casinus, his father. 5. Antiphonius, who has fragments of his lives of Valerian, and his son Valerian the younger, the lives of the two Gallici, and those of the Thirty Tyrants, who assumed in various parts of the empire the power and the title of Augustus, during the period of Diocletian and Constantine. He was born of a noble family in two of these, Trebellius Pollio has reckoned two women, the famous Zenobia of Palmyra, and one Victoria. He has also written the life of Flavius Claudius, one of the ablest and best emperors of Rome, whose reign was however too short for the duration of the day, and who was destined to succeed his. 6. Flavius Vopiscus of Syracuse. He lived under Constantine, and wrote the lives of Aurelian, of Tacitus, and his brother Florianus, of Probus, of the four tyrants, Firmus, Saturninus, Probus, and Constantine. Both in general the Historia Augusta consists of the Roman writers above-mentioned. Claudius Eutusenius wrote the lives of Diocletian, Maximinus Herculeus, Constantinus, and Valentinus, and has been called Historiarius Augustae, had they not been lost. There is a break in the Historia Augusta occasioned by the lives of Philippus, Decius, and Gallus, which are wanting. (Fabric. Bibliotheca Latina; Voos, de Historiae Latina; and the notes prefixed to the Bipont edition.)

AUGUSTIN, St., Bishop of Hippo, also called AULIUS AUGUSTINUS, one of the fathers of the church, was born, as he himself informs us (Epist. 327), at Tagaste, a small town of Africa, in the inland part of Numidia, of a family of the name of Augostin in the 13th, A.D. 384 (Acta Sanct. Augusti, tom. vii. pp. 217, 353; Tillemont, Ann. xiii. 2.) His father’s name was Patricius, and his mother Monica was a woman distinguished for her piety. At the beginning of his treatise De Beata Vite, Augustin speaks of his son named Adeodatus, and of his brother Navigius; and in his 109th epistle, of a sister who died an abbess. He prosecuted his studies in his earlier years, first at Tagaste, then at Madaura, and latterly at Carthage, where his close attachment to his predecessor, St. Novatus, a.D. 371, the fruit of a criminal connexion. The perusal of Cicerio’s Hortensius, about the year 373, first detached him from his immoral habits; and, about the same time, he entered into a holy conversation with the hermit Rusticana; but, for a short period, a zealous and able defender of his opinions. Chalmeric, from Bailleau, says, one thing gave him uneasiness in the perusal of Cicerio’s work, and that was not finding the name of Jesus, which had been familiar from infancy to him, in the writings of the emperors of Rome. He resolved therefore to read the Holy Scriptures; but the pride of his heart, and his incapacity to taste their simple beauty, made him still give the preference to Cicero. In the mean time he acquired fame as a rhetorician, and taught eloquence successively at Tagaste, Carthage, Rome, and Milan. At Rome he left the Mathematicians, and joined, for a short time, as he himself informs us, the sect of the Academicus. (De Haet. Virg., tom. i. 211) He returned to Milan, a.D. 384, where he lived in that time, until his name, whose merits added to the tears and entreaties of his mother Monica, a.d. 385, suffered Augustin’s entire conversion. He was accordingly baptized by St. Ambrose in the early part of the year 387, and a short time after by Eusebius Africanus. Augustin says in his letter A.D. 396, having, previous to his baptism, written his work De Immortalitate Animae. Soon after this, Monica his mother died at Ostia Tiberna. (See Confer. lib. x. c. 10.) He now renounced his rhetorical pursuits, and devoted himself to the study of the scriptures. At Rome he was frequently setting for near three years at Tagaste, where he wrote several of his works.

Being at Hippo, Valerius, then bishop of that diocese, ordained him a priest early in 391; and at a council held in 393, he desired the bishops, as a defence of the faith, that the bishops who composed it were
unanimously of opinion that he should be chosen one of their number. In 293 he became confessor to Valerianus, and was posted as an Augustinian in the position of Hippo. He appears to have established about this time a kind of clerical community within his episcopal residence; and was still active in his opposition, not only to the heresies of the Manichæans, but also to those of other sects. His \textit{De Cistente Dei}, is believed to have been begun a.d. 413. In 418, after the general council held at Carthage, he produced his two works against the Pelagians, \textit{De Gratia Christi}, and \textit{De Peccato Originale}, from a former of which he was cited in the Councils as \textit{Doctor of Grace.}. His labours were continued both personally and by his pen to the close of his life. His last work was his \textit{Confessiones.}

In the later part of his career, however, he had other enemies besides those of the church. The Vandals had entirely overrun Africa, and passed even into Spain, and Augustine had now for his opponents the enemies of the empire. Carthage and Hippo made resistance for a considerable time; and St. Augustine, though pressed by his associates, refused to quit his flock and escape by flight. Still he saw the imminent danger to which Hippo was exposed; and dreaming that it would fall into the hands of the enemy, prayed God that before that calamity happened to the city, the people of the city should be warned. It seem he was answered, as he died during the third month of the year, Augustine, 28th, a.d. 430, at the age of 76. (Victor Vitaeus, Episc. Hist. Persec. Vandaliae, s. v. Paris, 1694, p. 112.) The Vandals, who had taken Hippo the year before, did not think it prudent to make his body, his writings, and his library. Victor Vitaeus (Hist. Persec. ut suprà, p. 6) says his library contained at that time three hundred and thirty-two separate books, or treatises, on theological subjects, besides an exposition of the Psalms and the Gospels, and an innumerable quantity of homilies and epistles. The Catholic bishops of Africa carried his body to the island of Sardinia, the place to which they were driven by Thrasamond, King of the Vandals, a.d. 409; and Luippard, King of the Vandals, in a.d. 414, was compelled to give Sardinia, a.d. 721, from Sardinia to Pavia (Borowi Annalac, fol. LXXXII, 1738-54, tom. xii, p. 230.) An account of the supposed discovery of his relics, at a later time, will be found in Montfaucon's \textit{Dictionnaire Historique,} 4 to. Paris, 1709, pp. 29, 27; see also Muratori, \textit{Antiq. Ital. Mediae Aevi,} tom. v. fol. Milan, 1741, dissert. viii. p. 9.

St. Augustine's works, as the reader will have gathered from the preceding account of him, were numerous, and have been printed in a collected form repeatedly; at Paris, in 10 vols. fol. 1632; by Erasmus, from Frobenius's press, 10 vols. fol. 1640; by the divines of Louvain, 10 toms. fol. 1686; and by the Benedictines of the congregration of S. Gallen, vol. I. Paris, 1679-1700; 10 vols. fol. Paris, 1686-1703; and 15 vols. fol. Paris, 1700-1703.

The reader who is desirous to become acquainted with the detached titles of St. Augustine's works, may consult the \textit{Index Librorum omnium,} by his friend and colleague Prædicatorum, \textit{Ordo S. Augustini,} printed for the month of August, a. d. vi. pp. 441-460, with annotations; and the same work, pp. 353-357, for the progressive years of the production of the greater part. Some of St. Augustine's works are among the earliest specimens of typography known in our libraries. The \textit{Libcr de Arte Pro-}
demusa was printed by Fust at Mentz, in folio, before 1466, and another edition appeared in that very year from the press of Mentelium. The first edition of the treatise \textit{De Cistente Dei}, by Sixtus and Pernatius in the University of Subacco, fol. 1467; and another of \textit{De Vitæ Christi}, and \textit{De Singularitate Clericorum}, in the same year, by Olric Zell, at Hanau, in 4to.

The characteristic of Augustine, says Chalmers, has been depreciated by some modern writers, and ought undeniably to be considered with a reference to the times to which he lived, and the state of learning and religion. There is neither wisdom nor candour, however, in collecting and publishing the tracts of his early years, nor in denying that he may justly be ranked among the most extravagant and ungodly of ages who preserved and elucidated many of those doctrines which are held sacred in days of more light and knowledge.

The following is the character of him which has been given by the famous Augustinian Bishop of Hippo, filled the whole Christian world with joy and not without reason, as a variety of great and shining qualities were united in the character of that illustrious man. A sublime genius, an uninterrupted and seamless pursuit of truth, an invincible constancy in the resistance of heresies, and piety, and a subtle and lively wit, conspired to establish his fame upon the most lasting foundations. It is, however, certain that the accuracy and solidity of his judgments, and the variety of his talents now mentioned; and that, upon many points, he was more guided by the violent impulse of a warm imagination than by the cool dictates of reason and prudence. Hence that ambiguity which appears in his writings, and the truth that he has sometimes been justly charged with uncertainty with respect to his real sentiments; and hence also the just complaints which many have made of the contradictions that are so frequent in his works, and of the levity and precipitation with which he set himself to write, and of the various subjects he treated them with a sufficient degree of attention and diligence.

A Life of St. Augustine, the first part written by himself, in the first ten books of his \textit{Confessiones,} was published in English, 8vo. Lond. 1660; but a far more elaborate work, in Latin, is appended to the Benedictine editions of his works; and an account of his life and controversies fills the 12th volume of the \textit{Memores pour servir à l'Historie Eclectistique,} by M. Lenain ou Tillomont, 4to. Paris, 1708.

The second part of his life and history, as much as relates to his connexion with the Manichæans, will be found in Lardner's \textit{Credibility of the Gospel History,} part ii. vol. vi. pp. 55, 59, and again part ii. vol. x. pp. 199-203. The value of Augustine's works may also be estimated by the testimony of the testimonial, \textit{De Vita et Opere B. Augustini,} written by Lardner, and drawn from them. The more antient lives, however, from which the chief facts of the preceding account have been derived, will be found in the 6th volume for the month of August of the \textit{Acta Sanctorum,} which was recently edited:—Vita D. Aur. Augustini Episcopi Hippopotami, \textit{acto incerto,} etc. qui est in antiquo codice quatuor primi moenum (edit. Andr. Gul. Cratmer, 4to. Kiliana in Librelin Universitatis, 1655.}

\textbf{AUGUSTIN (ST.) CANONS OF THE ORDER OF, usually called AUSTIN CANONS. Regular Canons, says Bishop Tanner (Pref. to Notiti. Monast.), were such as lived under some rule: they were a less strict sort of religious than the monks, but lived together under one roof, had a common dormitory and refectory, and were obliged to observe the ten commandments of God.}

The chief rule for these canons was that of St. Augustine, who was made Bishop of Hippo, a.d. 395. But they were little known till the tenth or eleventh century, were not inserted into the Rule of St. Benedict, not having obtained the name of Augustin or Austin Canons till some years after. (Bingham, \textit{Antiq. of the Christ. Church,} b. vii. c. 2. s. 9.)

\textbf{Bale (Scrip. cent. xiii. 4) and Sir Robert Atkyns (Antiq. of Glos, p. 1) say, that these canons were brought into England by St. Birinus in the beginning of the seventh century; a.d. 630 or 640, as Fuller states in his Church History (b. vi. p. 268); but those were certainly secular canons, whose bishop placed them in Oxfordshire; and other historians agree that we have no evidence here till the eleventh, or probably till the twelfth century. For though they differ about the place of their first settlement, yet the general opinion is, that they came in after the time of King Henry I. He was the first to make provision for Austin Canons under a rule, according to Fuller (Ch. Hist. ut supr.), says, they were settled in London, a.d. 1059; but this is not believed. Somner says that St. Gregory's in Canterbury, which was built by archbishop Lanfranc a.d. 1084, was their first house (Antiq. Archb. p. 89) that Archbishop Lanfranc placed secular canons at St. Gregory's, and that Archbishop Corby changed them into regulars, makes the authority of that judicious anti-quoter in this case doubtful. Jocelyn says (Apolog. Brev. Lond. 157) that they were first bred there, and by Athelwalbus or Adalbus, confessor to King Henry I.
and had their first house at Nastell in Yorkshire; but they seem not to have been settled there till Thurlstan was archbishop of York, and that was not till 1114. Thurlstan was not the first canon of the Cathedral, for in the order, A.D. 1109, (See also Bishop Bower in his Histoire of the Cathedral of St. Edmund, v. 1. p. 34.) Stowe says (Surr. of London, p. 293) that Norman was the first canon regular in England, and that religious were first seated at the Holy Trinity, or Christ Church within Aldgate, London, A.D. 1109. But it does not seem to have been the see of an archbishop of London; whereas the house of these canons at Colchester was founded before the death of Bishop Maurice his predecessor, which happened Sept. 28, 1107. (Godwin de Preval, p. 175; N. i. 1. Ecol. vol. i. p. 10.) Another theorist, Bishop Tanner thinks that John Rossa (Mon. Angl. new edit. vol. vi. p. 602) and Pope Paschal II. (Tibald. p. 106) are right in placing them first at Colchester, though it could not be in Rossa's year, 1109, but was rather A.D. 1105. (See C. H. J. H. Hist. vol. vi. p. 292) places the coming of these canons into England.

Stevens tells us, in his Continuation of Dugdale (vol. ii. p. 65), that though there were regular canons who embraced the rule of St. Austin, taken from his 109th epistle, in the eleventh century (as particularly at the Abbey of St. Denis, at Rheims, about A.D. 1067), yet the regular canons did not make solemn vows till the twelfth century; and did not, in general, take the name of regular canons of St. Austin. Jonathan, who, in the Lateran Council, A.D. 1119, that all regular canons should submit to that rule of St. Austin in his 109th epistle. So that these regular canons certainly fall short of the time of their pretended founder; and therefore when black or regular canons are mentioned with a journey to the count of Flanders, we understand secular canons: for it was usual in those days to call the secular canons of cathedral and collegiate churches 'canonici regulares,' to distinguish them from the common parochial clergy, though probably many of those societies might become Austin canons afterwards.

Their habit was a long black cassock, with a white rochet over it, and over that a black cloak and hood. The monks were always shaved, but these canons were beards, and caps often hung in their eyes.

Tanner says he found above 175 houses of these canons and canonsesses in England and Wales. But besides the common and general sort of these canons there were also the following particular sorts:—1. Such as were observed St. Austin's rule according to the regulations of St. Nicholas of Arrosia (see Stevens's Contin. of Monast., vol. ii. p. 149, from Hist. des Ordres. Mon. tom. ii. p. 106; Acta Sanctorum, Jan. 13, and Regyn. i. p. 159), as those of Elbech in Dorset, of Netherhall, in the shires of Hertfordshire, Hertford; in Devonshire; Brunne in Lincolnshire; and Lilleshall, in Shropshire: 2. Some of the rule of St. Austin and the order of St. Victor; of which the monks, with the exposition of Hugh de St. Victor, as at Keynsham and Worsnop, in Somercote, and Wormeseley, in Herefordshire. Fuller (Ch. Hist. vi. p. 325) says St. Austin's, Bristol, was of the order of St. Victor; 3. Of the order of St. Austin, and the institution of St. Mary of Mervtune, as at Buckenham, in Norfolk; 4. Premonstratensians, or canons who lived according to the rule of St. Austin, reformed by St. Norbert. Archbishop of Magdeburg, who resided at Elbech, and afterwards, in the diocese of Laon in Picardy, a place so called because pointed out, as it is said, by the blessed Virgin to be the head of this reformed order. (Mon. Angl. new edit. p. 373; Pass. Mon. p. 139; Collier, Ch. Hist. i. p. 337.) They were brought into England by a fit A.D. 1140. It is reckoned that in England this order had about thirty-five houses.

The above particulars have been in part taken from Bede, but have been augmented by the Notitia Monastica, and the Introductory History of the Augustin Order in the new edition of Dugdale's Monastice, vol. vi. pp. 37-49. For more extended information, the Histore des Ordres Monastiques, quoted by Stevens, may be consulted; and, for the most part, the customs of this order in England, King's College, a British Museum, where the ms. is deposited.
bishop, and metropolitan of the English nation, by the archbishop of that place; after which, returning into Bedford, he ordained the presbyter and Peter the monk to Rome, to acquaint that see with the state of his mission, and to desire his solution of certain questions, which Bede (l. c. 27) has reported at length in the form of interrogatories and answers. Some of these points savour very strongly of the monastic spirit; but others lead to information respecting the early constitution of the Church. To his inquiries concerning the maintenance of the clergy, Gregory answered that the donations made to the church were, by the custom of the Romans, subject to taxation; for this reason, and for the maintenance and support of a monastery, with respect to the diversities of customs and liturgies, Gregory’s answer was truly liberal, implying that Augustine was not bound to follow the precedent of Rome, but might select whatever parts or rules appeared the most eligible or best adapted to promote the party of the church of England, and might compose them into a system for its use. Gregory also, at Augustine’s request, sent over more missionaries, and directed him to constitute a bishop at Canterbury, and after visiting the island, to select such bishops in such a manner, that Augustine of Canterbury should be metropolitan of all England. He sent over also a valuable present of books, vestments, sacred tonsures, and holy relics. He advised Augustine not to destroy the heathen temples, but to use them as Christian churches, and images of the gods to serve as images of Christ, and so gradually convert them into Christian churches, not only to save the expense of building new ones, but that the people might be more easily prevailed upon to frequent those places of worship to which they had been accustomed. He directed him, further, to accommodate the ceremonies of the Christian worship, as much as possible, to those of the heathen, that the people might not be too much startled at the change, and, in like manner, to allow the heathen converts, on certain festivals, to kill and eat a great number of oxen, to the glory of God, as they had formerly done to the honour of the devil. It is quite unnecessary to offer any remark on this mixture of pious zeal and worldly policy. Gregory, moreover, cautioned Augustine not to be puffed up with the miracles which he was enabled to work in confirmation of his ministry. (Compare Bede, l. c. 29, 31.)

Augustine having fixed his see at Canterbury, dedicated a church which had been built in earlier times by some Roman Christians to the honour of our Saviour; and King Ethelbert founded an abbey, dedicated to St. Peter and St. Paul, since called St. Augustine’s. (Ibid. c. 33.) The monks who had been left in England now saw an opportunity to establish a monastic house in the island; and, as a necessary step, to gain over the British, that is, the Welsh bishops, to his opinion. For this purpose a church was built in Westoe, and a place since called Augustine’s Oak, where the archbishop endeavoured to persuade the British prelates to make one communion, and assist in preaching to the unconverted Saxons. But neither this nor a second conference was successful; and Augustine as said to have threatened the Britons with a terrible calamity, as a punishment of their disobedience, which accordingly fell upon them in the shape of war (see Bede, l. i. c. 3). A.D. 593, after Augustine’s death, when Ethelbert was dead, his son, Ethelberht, Marchwarden, marched with an army to Caerleon, and when near twelve hundred monks of Bangor were put to the sword.

In the year 604, Augustine consecrated two of his companions, Mellitus and Justus, the former to the see of London, the latter to that of Canterbury (ibid. c. 3). In the same year he died at Canterbury, May 26th (Wharton, Angl. Secre., i. 91), and was buried in the churchyard of the monastery which goes by his name; the cathedral being not yet built. But after the consecration of that church his body was taken down from its position in the north porch, and deposited in a deep grave, where it lay till A.D. 1691, when it was removed and placed in the church by Wido, Abbot of Canterbury (Thorn. Suppl. x. col. 1793).

The observation of the festival of St. Augustine was first enjoined in a Syriac edict under Guthbert, archbishop of Canterbury (Gervase, Act. Pontif. Cantuar. Scrit., x. col. 1641), and afterwards by the Pope’s bull in the reign of Edward III. (Thorn. col. 2119.)

AUGUSTINE, ST., a town and sea-port of East Florida, in the United States, situated on a bay of the Atlantic, two miles within the bar, which is very shallow, 310 miles S. of Charleston, and 30 miles S. of the mouth of the St. John’s river; 29° 48’ N. lat., and 81° 33’ W. long. The town is oblong, and consists of four principal streets. The houses are built of stones formed by the accretion of shells along the coast of Anastasia Island. It has a fort with thirty-six guns on it. In 1821, when Florida was ceded by Spain to the United States, St. Augustine reckoned 2500 inhabitants; but it has since been in a state of decay. The country around produces very fine oranges, and good crops of rice, indigo, and cotton. (Encyclopaedia Americana; and Bartram’s Florida.)

AUGUSTOVO, the most northern voyvodship (a term derived from the Slavonian word ‘voy,’ or ‘voi, troops, and ‘vod,’ as ‘voda,’ to lead) of Russian Poland. On the partition of Poland it was merged in Eastern Prussia; in the time of Napoleon it became part of the department of Lomza in the duchy of Warsaw; and upon its transfer to Russia, in 1815, it was formed into a separate voyvodship or county. The line of its boundary is a continuation of the line which separates it from the Russian provinces of Vilna and Grodno, follows the course of the Niemen, Bobr, and Narw; in the southeast it joins the Russian province of Bialystock, and on the south, the voyvodship of Plock; on the west it is wholly bounded by Eastern Prussia. The length of this voyvodeship is 260 versts (about 170 miles), and it is 100 versts (about 65 miles) in its greatest breadth. Its area is about 7000 geographical square miles; it lies between the 52d and 62d degrees of north latitude, is divided into five counties, and 153 parishes, and contains 47 towns, the chief of which are Suvalky, the capital, Augustovo (from which its name is derived), Stabin, Pressn, Novogrod, Lomza, Zambrov, and Staropol, 4470 villages, and 35,999,000 acres, of which 69,000 are meadows and 1,673,000 acres, of which are alluvial, and 8,000,000 are forested, of which 2,000,000 are being full of linden-trees, whence the celebrated ‘ Lindenhoney.’ The northern districts of Augustovo form an extensive plain, and the soil being fertile and well cultivated produces a fine description of wheat, the most of the 120,000 grown in the southern districts, which are watered by the Narw. Of the whole surface of the voyvodeship about three-tenths consist of arable land, and four-tenths are occupied by woods and forests: the quantity of unproductive arable land is about 1,300,000, of which 650,000 are for gardens, pastures, highways, and buildings, and does not exceed one-fifth of that surface.

The town of Augustovo is on marshy ground at the southern extremity of lake Stabroek, out of which the Netta flows, and at a distance of 164 versts (110 miles) N.E. of Warsaw. It was founded by Sigismund Augustus, king of Poland, in the year 1560; it is fortified, contains two churches, an hospital, and about 3600 inhabitants, and is a large fair for horses, cattle, and salt. A canal with seventeen sluices is in process of being excavated near the town for the purpose of uniting the Vistula, by means of the Narw and Bug, with the Niemen: a second canal will form a junction between the Niemen and the Vistula, and connect the sea with the mouth of the Duna in the Baltic. Augustovo is in 53° 40’ N. lat., and 22° 58’ E. long.
AUGUSTULUS, the last emperor of the western portion of the falling empire of Rome, was the son of Orestes, a Pannonian of birth and wealth, who stood high in the favour of Atius, Afterwards secretary of state, and in his death, entering the Roman service, rose, step by step, to the highest dignities by favour of the Emperor Julius Nepos. He rewarded his patron by stirring to mutiny the barbarian confederates or troops in the pay of Rome. Nepos died, and Orestes was offered the vacant throne for himself, established his son upon it. This youth, who bore the lofty name of Romulus Augustus, possessed no qualities to distinguish him except personal beauty; and his character is aptly expressed in the character of his name, Augustus, by which he is universally designated. Within a year Orestes fell, as he had risen, by the army. He offended the licentious barbarians by refusing to distribute among them a third part of the lands of Italy; and a less scrupulous leader appeared, Odoacer, the most barbarous of the military princes of the Ostrogoths, whom the emperor of the East, Justinian, was determined to select as his successor. Orestes was besieged in Pavia, taken, and put to death; the helpless and inexperienced Augustus yielded at once, and on his abdication was kindly treated by Odoacer, who allotted for his house the celebrated villa of Lucullus, on the promontory of Misenum, near Naples, with a pension of 6000 pieces of gold. The date commonly assigned to this extinction of the western empire is 476, but Gibbon appears to sanction 479. (Jornandes. Vet. Get. iv. 1.)

AUGUSTUS is properly only a title of honour which was conferred upon the first emperor of Rome, and afterwards adopted by his successors. The meaning of the word seems to have been sacred, as it appears to be derived from Augur, the priest who gave the sanction of the gods to the persons of the Roman magistrates (see Augus)—the analogy between the two words being precisely the same as that between robust (strength) and robustus (strong). The Greek writers interpreted the word by sebas (adorable), from sebas, adoration. (See the inscription on the coin of Arrius.) But though the title was common to the emperors of Rome, it is in history generally limited to the first who held it, and is almost looked upon as his proper name. For this reason it will be convenient to treat it as a sweet of that emperor under the present head, rather than under the names Octavius, Julius, or Cæsar.

AUGUSTUS. This extraordinary man was the son of C. Octavius, and Atia. Atia was the daughter of M. Atius Balbus and Julia, the celebrated sister of the C. Julius Cæsar, who was consequently the great uncle of Augustus. The Atii were particularly connected with the town of Aricia and had given many senators to Rome, so that the antiquity of the family afforded a pretext to Vitellius for tracing them from Atius, the friend of young Aesculapius (Atius. v. 568). The Octavii, on the other side, were a wealthy family of Velitrae; but the first who obtained admission into the Roman senate, if we reject the inventions of Flavius, was the father of the emperor Augustus, or, as we ought at present to call him, Octavius, was born at Velitrae on the 22nd of September, a. d. 63, in the consulship of Cicero. In a. d. 60, his father was appointed as prior to succeed C. Antonius in the government of Macedonia. On his route thither he was further directed to subdue some insurgent slaves, the remnant of the bands of Spartacus and Catiline, who had made themselves masters of the district around Thurium, and from his success in this expedition, he gave to his infant son the name of Thurium. In Macedonia, Octavius conducted himself in a manner which was most favourably contrasted with that of his predecessor, and Cicero in his letters pointed him out as a pattern to his brother Quintus, who, at the same time, was the governor of Asia (Caecilius Vitellius. a. d. 15; Quintil. i. 1 and 2). Immediately after his return from his province, Octavius died, leaving behind him Octavius the elder by his first wife Anarchia, and Octavius the younger, together with the children of their marriage. In the year 46 a. d. we find him the object of Cæsar's regard, who, in his Avarus triumph, allowed him to share the military rewards given to his army, though he had not been present in the war. In the following year he was present with his great general, C. Julius Cæsar, near the battle of Pharsalus, after which he was sent to Apollonia, on the Adriatic, that he might employ the winter in study under Apollodorus of Pergamus, and at the same time be ready to accompany the dictator on his projected expeditions against Dacia and Parthia. Besides these marks of esteem, he had already, through the interest of Cæsar, been appointed pontifex (Vell. ii. 59), and had received the honour of patrician rank under the Cæsarian law. However, he had barely been at Apollonia six months when he heard of the murder of his benefactor, and this was soon followed by the information that he had been appointed his heir and adopted into the Julian family. He was only eighteen years of age, and his step-father, in his letters from Rome, strongly recommended

[ Brit. Mus. Gold. Double the actual diameter.]

(Obverse.)

him to keep away from public affairs; yet, after a little hesitation, he crossed over to Italy with his friend Vitellius and Agrippa, and was most favourably received by the legions at Brundisium. On the 18th of April he had already reached Naples (Cic. de Att. xiv. 10), and two or three days after, Cicero saw him at the house of his step-father, Antony at this period was beginning to lay aside the hesitation which marked his conduct in the first spurs of the idea of March, and for the arrival of young Octavius, the two parties would probably soon have brought the dispute to some decided issue. But the appearance of Octavius on the scene was the commencement of a series of intrigues which even the historian has found it difficult to unravel. The connexion of Octavius with his murdered benefactor might naturally have led to an alliance with Antony; while, on the other hand, the marriage of his mother with Philotus brought him at once into contact with the chief of the opposite party. In this difficult situation a boy of eighteen played his part in an art which baffled the prudence of the oldest statesmen of Rome. Already at Naples, he persuaded his mother to become the wife of Pompey, near his death, though that he was altogether devoted to his counsels, and yet by assuming the dreaded name of
Cæsar he threw out a hint which was well understood by the veterans and the people to whom that name was dear. Notwithstanding, Cæsar was absent at Rome than he appeared before. C. Antonius the praetor, and formally accepted the dangerous inheritance of the dictator's name and property, so that henceforward he was called C. Julius Caesar Octavius—the last epitaph being added to mark his previous congratulations. Having thus joined him, called him his birth into public life, we must leave to the historian the task of recording the annals of the world during the next fifty-eight years, in which the name of Cæsar or Augustus continued to express a paramount event of importance.

His private life may be briefly considered. A daughter of P. Servilius Isauricus was betrothed to him, but the marriage was not completed, when the troops, after the war of Mutina, and the reconciliation which soon followed, he had betrothed him to his co-religionist, called him his birth into public life, we must leave to the historian the task of recording the annals of the world during the next fifty-eight years, in which the name of Cæsar or Augustus continued to express a paramount event of importance.

Augustus showed himself intolerant towards the Calvinists who had spread into Saxony and other parts of Germany, and between himself and the Lutheran party, bitterness at the time. He banished them from his dominions, and caused a creed of Lutheran orthodoxy to be drawn up, which was styled Formula Concordiae, and was accepted by three other Protestant electors of Germany.

In another respect the sway of Augustus was mild and beneficent. He respected the constitutions of his country, and consulted the assembly of the states on all important occasions, especially in the raising of subsidies. His laws and edicts were reduced to high esteem, and the laws and edicts of his cousin, John George, were also held in high esteem, and the laws and edicts of some of the Justinian of Saxony. He embellished Dresden, and built the fine palace of Augustengrund; and at the same time managed to leave the coffers of the state well filled at his death in 1586. He was succeeded by his son Christian.

AUGUSTUS II. This is the title by which the monarch is generally known who united the crown of Poland with the electorate of Saxony in 1690, although in Saxon histories he is more generally styled Frederick Augustus I. He was the second son of John George III., elector of Saxony, and was born at Dresden in 1670. Distinguished from his earliest age by great personal advantages, uniting beauty of figure with Herculaneum strength, Augustus improved these to the utmost by military campaigns, by treaty with France, and by a prolonged residence in its various courts. While at Vienna he formed a friendship with the future emperor, Joseph I. His father was somewhat mistrustful of the prosperity shown by his son to foreign powers and princes so hostile to the Protestant interest; and on the death of the old elector forbade his visiting Rome,—a vain precaution, as it afterwards proved. For similar reasons a jealousy existed between Augustus and his elder brother, who succeeded to the electorate, as John George IV. in 1680.

This prince dying in 1694, made way for Augustus, who showed himself severe towards his brother's mistresses and favourites. His first step was an alliance with Austria, as was afterwards the case with France; but as he refused to serve under Prince Louis of Baden, whom he commanded as Imperial General upon the Rhine, the court of Vienna entrusted him with an expedition against the Turks in Hungary. Here he showed more valour and observance than either good fortune or skill. But it is to be remembered, that the Turks were then at the very height of military fame, that they had not long before encamped under the walls of Vienna, and that Sobieski himself, who had driven them thence, had not been always subsequently successful. As the Turks afterwards gave the name of head-quarter to Charles XII., so they called Augustus the Iron-handed.

The death of the heroic Sobieski in 1696 left the throne of Poland open to the ambition of candidates. His son, James Sobieski, was thwarted in his hopes of succeeding to the royal heritage by the aversion and enmity of his mother. The elector of Bavaria, and the prince of Conti, both aspired to the throne of Augustus, and induced them to renounce their ambition by Count Przebodecki, one of the chief dominions of the kingdom, who promised that money would insure success. It is probable that the court of Vienna also urged him to the attempt, in order to prevent the crown of Poland from falling to the lot of Frederick prince. Augustus, through his able envoy, Count Fleming, lavished considerable sums at Warsaw: he thus obtained the advantage over his rival, who could but promise ten millions of florins, while Augustus paid them. The Protestant faith of the Elector of Saxony was still a serious matter. It was removed by a public recantation at Baden, near Vienna, on Whitsunday, 1797. He thus rendered it not only the religious creed of his native kingdom, but its interests and resources, to the acquisition of a foreign dukedom, and born to the tenth millions of florins. Augustus promised to support an army of 6000 men at the cost of Saxony, and to recover Kamminett, Wallisch, Moldavia, and the Crimea.

Notwithstanding these promises, the great majority of electors, in a body, held the crown and offered it to the princes of the house of Conti. The minority, however, proceeded to proclaim Augustus, who entered Poland at the head of 8000 Saxons; while the prince of Conti, being invited, promised to return. To defend himself, he entered Cracow in a dress valued at a million of florins. In the early part of 1696 he succeeded in establishing himself.
self almost the undisputed monarch of Poland: France and Sweden alone refused to recognize him.

The first aim of the new monarch was to keep his promise of recovering for Poland its lost possessions of Podolia, the Ukraine, and Kamieniec. War, conquest, the foundation of alliances were now the anime, it seems, of the favourite dreams of Augustus. He aimed in every respect at being the Louis XIV. of the North: but it was his fate to meet with as formidable rivals, and even more fatal returns, than the French monarch. He commenced by concluding a truce with Gustavus of Sweden, who had invited the hostility of Sweden, and then marched with an army of Saxons and Poles to drive the Turks from Kamieniec.

While proceeding on this expedition, the Polish monarch met his new Peter, and learnt of the Great in France, but returning from his travels with all the picturesque projects that were to procure him this title. The bold, frank, ambitious, yet uncrafty Augustus was the ally most suitable to Peter's views: a close alliance was concluded between them, and a scheme of conquest, at the expense of Sweden, was projected. Augustus then continued his march against the Turks. Dissensions soon after broke out in his camp between the Poles and Saxons, and would have terminated in combat, but for the interference of a Lithuanian regiment; but his alliance with Russia enabled him to conclude the Treaty of Carlowitz, by which most of the territories which he sought to recover were ceded to Poland.

In the treaty thus concluded, the allied monarchs proceeded to the completion of their projects against Sweden.

This kingdom, under the rule of an infant prince, seemed likely to offer no formidable resistance; and to detach Livonia from it struck Augustus as an easy task, more especially as Pathki, a refugee Lithuanian, promised faith to his countrymen in support of the Saxon cause. Augustus accordingly invaded Livonia, and laid siege to Riga. The provocations had one of those electric effects on human character that change the face of history. The young Charles XIII. of Sweden from the insignificance of youth, and excited at once the prince and his people to a pitch of heroism, that rivalled, or even surpassed, for a time, the glories of the great Gustavus. To resist his enemies, Charles raised a storm in front of his formidable batteries, which was forced to submit. He then proceeded against the castr, encountered a large army of Russians at Narva, and gained a complete victory on the 1st of September, 1700. Augustus was still engaged in the siege of Riga.

Compelled to abandon it by the approach of the Dutch, he affected to do so at the solicitations of the Dutch, and hastened to join the castr, with whom he concluded a new and more close alliance, offensive and defensive.

Charles in the meantime reoccupied Livonia, and in July, 1701, defeated the Saxon army on the Duna, compelling it to abandon fortresses and artillery. The Russians afforded severe resistance, but the fortunate Saxons were throughout made the sacrifice and the sufferers for others: for Augustus, wanting the art of attacking him any of the great parties of Poland or Lithuania, could depend in his distresses upon the affection of his native kingdom alone. Lost in self-admiration, like Louis XIV., no one would have been more worshiped than Augustus, had he been fortunate; but, in adversity, more were despised or forsaken. The only mode that he could adopt to cheer the hostile pressers of Charles, was to dispatch to him the Count of Konrady, his mistress, in the hope that the persuasions of beauty might soften the resolutions of the Swedish king. Charles, however, refused to see the fair envoy: he perished in guarding Augustus as a usurper, and would not grant peace to the Poles, except on the condition of their electing another king. But Augustus resolved not to yield without another effort: he flew to his native Saxony, drained it of its provinces and soldiers, and marched by the way of Czernowitz to the relief of Riga, captured between Chisarow and Bincow, on the 19th July, the very day which, in the previous year, had been marked by the fatal battle on the Duna. The result was now similar. The Swedes, however, having now learned the art of war, and had the brunette of the battle falling upon the latter, they suffered another disastrous defeat. Several of the palatines of Poland, in consequence of this, formed a kind of league, for the purpose of preserving the land from the ravages of war. At the head of these was Posen, of which Stanislaus Leszinski was Prince. Charles succeeded in rallying this party against Augustus, who still held some vain efforts to maintain his ground. The Saxon general made another stand at Pultsuk, with the cavalry which he commanded, but the Swedes were, as usual, victorious; and Charles having retired to Warsaw, the other King of Poland elected in place of Augustus. His views turned at first naturally toward the sons of Sobieski, whose election would have indicated a national choice; but the young Charles, the children of the eldest brothers; and as the younger refused to accept the crown to Prejudice of his elders, Charles was obliged to seek another candidate. He pitched upon Stanislaus Leszinski, who was accordingly elected king, on the 12th of July, 1704.

The new monarch, partly from the patron's hostility towards Saxony and Russia, and both accordingly prepared to invade the electorate, and by the conquest of Dresden itself force Augustus to abandon all claim to the Polish crown. The elector of Saxony, however, had not yet lost all hope; Russia was his ally, Austria his friend, and the Pope obstinately refused to recognize the right of his competitor. A new army of Saxons, commanded by Schonenburg, had been raised to defend the electorate, and the castr had promised to second its operations. But fortune was again wanting to the efforts of the Saxons, and the defeat of Schonenburg at Fruschat left Saxony completely exposed to the conqueror. After this disaster, Augustus was thrown upon the wantonness of the Swedes, and accordingly sent agents to treat with Charles, secretly however, since he himself was yet within the camp and the power of Russia. But before Augustus could escape, the Swedes forced him to a measure calculated to intercept, or prevent altogether to a permanent superiority. By the advance of Saxony, the Swedish force in Poland had been much reduced; its commander had moreover relaxed his vigilance, relying upon the negotiations which he was aware were carrying on the Elector of Saxony, and were, doubtless, to take advantage of the moment and to attack the Swedes. He did so with success, and even entered Warsaw in momentary triumph. But Augustus was ashamed of an advantage so unfairly gained, and so little likely to con- qnue to a permanent superiority. Instead, therefore, of making use of it to raise his tone, or diminish his concessions to Sweden, he on the contrary offered to make amends for the oppression; and at the same time accepted without hesitation the conditions that the Swede forced upon him, by roasting. Abandoning Russia, he hastened in person to meet the Swedish monarch at Altranstadt, and to conclude peace upon terms sufficiently humiliating. Augustus abdicated the crown of Poland in favour of Stanislaus, promised to respect this prince, his crown, and person, by letter. He abandoned his allies and his fortresses, and was obliged to give up the unfortunate Pathki to the vengeance of Charles. What must have been still more on his mind, in concluding, Charles, his predecessor Gustavus Adolphus, made himself the Defender of the Protestant Faith; and stipulated that Augustus should respect the creed and privileges of his protestant subjects of Saxony. This peace was concluded towards the close of the year 1706.

Augustus now saw himself confined to his native dominions, and condemned to political insignificance. He endeavored to drown disappointment in luxury and expense; and his efforts were not without some success. In 1708 he placed a Saxon army of 9000 men at the emperor's disposal in the Netherlands. Schonenburg commanded them; but Augustus himself served in their ranks as a volunteer, and as such took part in the siege of Lille. His natural son, Maurice of Saxony, made his first campaign on this occasion. The battle of Pultowa, and the overthrow of the power of Sweden in 1709, recalled Augustus to the throne of Poland. The pope released him from his oath of adoration. Russia, Prussia, and Denmark, in opposition to this pontificate, restored him to the possession of all his former dominions. He died in 1733, after a reign of 17 years. Augustus was always a personal friend of the Swedish general. Fortune, often favourable to Augustus while he remained inactive, never failed to abandon him as soon as he took the lead, or endeavoured to play the conqueror.
Charles XII, himself soon after re-appeared upon the scene; but all his histrionics was less dangerous to the allies than the intrigues of his still more treacherous minister, the Count de Goertz, who almost succeeded in subverting the existing alliances between the European states. He had nearly dissolved the bond between Augustus and Russia, when the death of Charles XII. was shewn to be a conclusion the struggles of war and of political intrigue.

The restoration of Augustus to the throne of Poland aggravated the ills of that unhappy country. If Stanislaus had been raised to the throne by the decision of a foreign power, he would have been under Russian support, and who first placed the country at the mercy of surrounding states. Unable to rely on the Polots, Augustus endeavoured to defend his authority by Saxony's protection and assistance. But they had no consequences; and the means by which these were terminated were as disastrous as the ills they remedied. It was first decided that the Saxony soldiers should evacuate the country; and on the other hand it was agreed, under the crafty mediation of Russia, that the national army of Poland should be reduced, from near 100,000 to the insignificant force of about 20,000 men. These measures of Augustus, says Malzewski, brought peace to Poland; but it was the peace of the terms of a partition. The interval between 1718, the year of Charles XII's death, and that of Augustus, which took place in 1733, passed away without being marked by any remarkable incidents. The unsuccessful effort of Augustus to secure the crown of Poland gave rise to his only attempt at active policy. A marriage between the king's eldest son and an archduchess of Austria was an opportunity for Augustus to display all his magnificence. The procession was such as could only be yearly repeated. The diamonds and embroidery had never been seen in greater profusion. But the good people of Dresden could only look with discontented eyes on a scene of magnificence, cruelly contrasted with their own recent and present misery. In addition to this, the recantation of the young prince, and the favour shown by the king to the Jesuits and his Catholic party in Poland, filled the Lutheran population of Saxony with anxious fears for their religious liberties.

Augustus was not beloved by his subjects either in either of his kingdoms; each complained that they were sacrificed to the other, while, in reality, both were sacrificed to the vain-glory of the prince. In Saxony, however, his prodigality was favourable to the arts; and the porcelain manufacture of Saxony (the rage with the princes of that day) may be said to have been founded in his reign. Poland had not even this trifling recompense. Such were the miserable results of the reign of a monarch who possessed personal accomplishments, as well as high and mental talents in no mean degree. Like Louis XIV., his greatest model, he was the hero of courtiers rather than of soldiers—beginning his career with mighty plans of empire, and saved at length from ruin merely by the kindness of fortune. At once a great and splendid prince, he was, in his old age, a monarch of the run of kingdoms over which he ruled, while the gorgeous luxury and far-famed magnificence of his person and his court rather aggravated than diminished the wealth of the kingdom of his people.

AUGUSTUS III

On Augustus II, elector of Saxony and king of Poland, was born at Dresden in 1586. His father, wishing to give him the same accomplishments that had distinguished himself, sent him in 1711 to visit the different courts of Europe. But the life of pleasure from his travels only the love of idleness and pleasure. He returned ' stiff, indolent, and backward,' says the historian of Saxony; 'good natured, indeed, which served to repress the faults of former; The father had at least an aim, in which he may have failed; but the son had neither aim nor purpose to fail in.'

The death of his father in 1733 made Augustus elector of Saxony, and left him at the same time the strongest prince of Poland. From 1712, the indolent nature shrunk, it is said, from struggling to attain this unattainable consequence; but his wife, a daughter of Austria, supplied her husband with ambition, and Augustus became a candidate. He was supported by the courts of Vienna and St. Petersburg. In consequence to his marriage, Augustus made a monarch of easy disposition, possessed of foreign and distant dominions; France, however, favoured his father's old competitor, Stanislaus, whose daughter had become the wife of Louis the Fifteenth, and the Polish nation nearly embraced the occasion to elect and to rally round a native prince. But a Russian army advanced to enforce the pretensions of Augustus III.; the Poles disputed gallantly, but unsuccessfully, the passage of the Vistula, and under Russian auspices a few of the Saxony partisans in Poland, under Augustus, rising in the name of Louise Augustus, was elected king of Poland. His competitor Stanislaus was obliged to fly and take refuge in Danzig, which he was compelled eventually to abandon, along with his pretensions to the throne of Poland. Augustus, although received at Cracow in the commencement of 1734, did not become undisputed monarch of Poland till after the Diet of Pacts, held at Warsaw in 1736. Though oppressed by Bouchon, the Poles showed themselves jealous of their independence, and they threatened to withdraw their support to the king, and for the maintenance of only 1200 Saxon guards within the kingdom. Augustus yielded, and half reluctant, Poland once more submitted to a Saxon prince.

Up to the time of his accession, Augustus had bestowed his confidence chiefly upon the old companion of his travels, Sulikowski; but this favourite was superseded by another, Count Bruhl, who henceforth monopolized all authority in Saxony and Poland. Mutual stipulation was made between the two states that the sole object of the French and Prussian wars was to expatriate the king of Prussia from Prussia. The death of Frederick the Great, the king of Prussia, excited the jealousy of the Saxony house, and incited its ministers one day to oppose Prussian aggression, the next day to imitate it. The probable dissolution of the Austrian empire after the death of Charles the Great, which gave rise to the idea of an independent Poland, Ulriczowski's project to conquer Bohemia for Saxony. Bruhl at first abandoned this scheme and leagued with Austria to support the succession of Maria Theresa. In a little time, however, he was forced into the same party, and to resume the scheme of appropriating Bohemia, while Frederic was to have Silesia. Augustus acquiesced. The Saxony and Prussian troops fought in alliance, but had not been long in the field, when Augustus learned of his minister's designing to leave him in Prussia. Frederick. Soon after, in 1743, an alliance was concluded at Warsaw between England, Saxony, and Austria, for the defence of the house of Hapburg. The king of Prussia instantly made 100,000 men to march into Saxony, but was all opposed him, and made himself master of Dresden, December, 1745; whilst Augustus, with his minister, took refuge in Poland. The truce of 1746, however, restored to him the electorate; and at the same period took place the marriage of Augustus's daughter, Maria Josepha, with the dauphin of France; a marriage from which sprung Louis XVI., Louis XVIII., and Charles X., the present exiled king of France.

The impossibility of coping with Prussia, already proved by the defeat of the Saxons and their allies, could not keep Augustus or his minister from leaguing once more against Frederick, and even planning to share that monarch's territories with Russia. In consequence of this, Frederic invaded Saxony, and suddenly turned on the entire Saxon army in its intrenched camp at Purna. Augustus again fled to Poland. His reign in the latter country was as pernicious as in Saxony. If Saxony was humbled in its pride, stripped of its resources, and ravaged by invading armies, Poland suffered equal injury, though less violence. It was allowed to sink into what Ruhlieres calls 'a tranquil anarchy.' Its debts, which were seldom held, were never allowed to come to an end. The resolution of the prince was a source of vexation to Augustus, who was passionately fond of the chase, preferred the well-stocked forests of Saxony to the plains of Poland. Saxony itself having fallen into inscriptions it was a source of much vexation to the Russians. Simultaneously, St. Petersburg became the capital, to which the Poles resorted, rather than to Dresden. Thus the supremacy of Russia was allowed silently to establish itself in Poland under the simple government of Augustus. Pictures, pelvain, fetes, and festivals, the usual cares of the state, were the only care Augustus, the only care Augustus, the only care Augustus, the only care...
birds of the family Auk, known scientifically as species of the subgenus Alca, Fratercula, Mergulus, and Phalor.

Subgenus Alca.  

The true Aukas, though they are strictly oceanic birds, rarely ever leaving the water except for the purposes of reproduction, will sometimes proceed swiftly, though awkwardly, on foot when pursued on land. They breed in large colonies, in coves and rocky cliffs, laying only one disproportionately large egg. Their food, which they obtain by diving (an operation in which they are materially assisted by their wings as well as by their feet), consists of small fishes, crustaceans, and other marine animals. The young are said to be fed from the crops of the parents, not only before they are able to leave the place of their birth, but also for some time afterwards.

The genus Alca, as it is reduced by modern ornithologists, includes but two species, apparently incongruous. The first of these, the Great Auk (Alca impennis, Linn.) remarkable for the imperfect development of its wings, seldom leaves the arctic circle and the regions bordering on it, and is a rare visitant to the British isles. Dr. Fleming, however, gives an account of one taken alive at St. Kilda (Alca impennis).

(where they are sometimes known to breed), which, even with a long and heavy cord tied to its leg, swam under water with extraordinary speed. The power of the apparently useless wings as organs of progression was still more strongly shown in the Great Auk chased ineffectually by Mr. Bullock during his tour to the Northern Isles: for the four cars of the bird are said to have left the secured boat of his pursuers far behind. According to the same authority, only a single pair had been known to breed in Papa Westra for several years. Newfoundland is recorded as one of their breeding places, and Pennant relates that the Equinoxus who frequented the island made clothing of their skins. In the ocean that washes the Feroe Islands, Iceland, and Greenland, where they dwell in great numbers, they may be frequently seen on the floating ice; but Pennant says that they are observed never to wander beyond soundings, and that seamen direct their measures according to their appearance.

The food of the Great Auk consists principally of fish; and the Lamp-fish (Cyclopus lumpus) is said to be its favourite morsel.

The length of the bird is somewhat under three feet. The winter plumage, which begins to appear in autumn, leaves the cheeks, throat, fore-part, and sides of the neck white. In spring, the summer change begins to take place, and confines the white on the head to a large patch, which extends in front and around the eyes; the rest of the head, the neck, and upper plumage is of a deep black. There is a specimen of the bird in its summer dress, in the British Museum, with 'Papa Westra' on the label. The Great Auk breeds in June and July, laying one egg, about the size of a swan's, of a whitish-yellow, marked with numerous lines and spots of black, which have been supposed to bear some resemblance to Chinese characters.

In the Black-billed Auk, Razor-bill, or Murre (Alca torda, Linn.), the development of the wings is carried to the usual extent necessary for the purposes of flight, though the bird uses them with great effect as oars when swimming under water.

The northern hemisphere, where they are widely diffused, is the portion allotted to these birds; but it is in the higher latitudes that they swarm. In England, the Needle's, and other adjacent precipitous cliffs, have a fair share of them; and here, as in other places, the 'dreadful trade' of taking their eggs, which are esteemed a delicacy, for salads especially, is carried on. In Ray's Willoughby, the habits of the Razor-bill are thus described: 'It lays, sits, and breeds up its young on the ledges of the craggy cliffs and steep rocks by the seashores that are broken and divided into many as it were stairs or shelves, together with the Coulterneb and Guillermot. The Manks-men are wont to compare these rocks, with the birds sitting upon them in breeding time, to an apothecary's shop—the ledges of the rocks resembling the shelves, and the birds the pots. About the Isle of Man are very high cliffs, broken in this manner into many ledges one above another, from top to bottom. They are wont to let down men by ropes from the top of the cliffs, to take away the eggs and young ones. They take also the birds themselves when they are sitting upon their eggs with snares fastened to the tops of long poles, and so put about their necks. They build no nests, but lay their eggs upon the bare rocks.

On the coast of Labrador they abound, and the thousands of birds there killed for the sake of the breast feathers, which are very warm and elastic, and the quantities of eggs there collected, amount to almost incredible numbers.

The summer and winter dress of the Razor-bill, though different, do not vary so remarkably as the plumage of many other birds. In the summer dress, the white streak which goes to the bill from the eyes, becomes very pure; and the cheeks, throat, and upper part of the front of the neck are a dark brown, shaded with reddish. In winter, the throat and fore-part of the neck are white.

The young of the year is, by the best authorities, supposed to be the Alca Pica of Gmelin.

The Razor-bill is little more than fifteen inches long. The egg (for they lay but one) is very large in proportion to the bird, being about the size of that of a turkey, but of a longer shape, pointed towards the smaller end, white or sometimes yellowish, blotched, and streaked with dark brown, chiefly towards the larger end.

Subgenus Fratercula.  

Leaving the true Aukas we come to the genus Fratercula Bries (Mormon, Illiger), of which the Labrador Auk, common Puffin, or Coulteneb, Fratercula Arctica, Mormon...
but there is little doubt that other fishes and crustaceans are acceptable to the bird.

Subgenus Mergus.

The Little Auk, Common Scoter, or Sea Dove, Mergus Melanoleucus of Ray, Ursus Alle of Temminck, and Alcea

[Fratercula Arctica.]

\textit{Fratercula}, Temm., \textit{Alca Arctica}, Linn., may be taken as an example.

Selby gives the following account of the habits of this bird, and is corroborated by others who have written on the subject: 'Although the puffin is found in very high latitudes, and its distribution through the arctic circle is extensive, it is only known to us as a summer visitant, and that from the south, making its first appearance in the vicinity of its breeding stations about the middle of April, and regularly departing between the 10th and 20th of August for the southern coasts of France, Spain, and other parts of Europe, where it passes the remainder of the year. It breeds in great numbers upon Prionotholm Island, off the coast of Anglesia, on the Isle of Man, and most of the islands, indeed, of the English and Scottish coasts. Many resort to the Feroe islands, selecting such as are covered with a stratum of vegetable mould; and here they dig their own burrows, from there not being any rabbits to dispossess upon the particular islets they frequent. They commence this operation about the first week in May, and the hole is generally excavated to the depth of three feet, often in a curving direction, and occasionally with two entrances. When engaged in digging, which is principally performed by the males, they are sometimes so intent upon their work as to admit of being taken by hand, and the same may also be done during incubation. At this period I have frequently obtained specimens, by thrusting my arm into the burrow, though at the risk of receiving a severe bite from the powerful and sharp-edged bill of the old bird. At the farther end of this hole the single egg is deposited, which in size nearly equals that of a pullet, and, as Pennant observes, varies in form; in some instances one end being acute, and in others both equally obtuse. Its colour when first laid is white, but it soon becomes soiled and dirty, from its immediate contact with the earth; no materials being collected for a nest at the end of the burrow. The young are hatched after a month's incubation, and are then covered with a long blackish down above, which gradually gives place to the feathered plumage, so that at the end of a month or five weeks they are able to quit the burrow, and follow their parents to the open sea. Soon after this time, or about the second week in August, the whole leave our coasts, commencing their equatorial migration. At an early age the bill of this bird is small and narrow, scarcely exceeding that of the young Razor-bill at the same period of life; and not till after the second year does this member acquire its full development, both as to depth, colour, and its transverse furrows.

In rocky places (Dover cliffs for instance), they deposit their single egg, as Montagu observes, in the holes and crevices. The length of the bird is about twelve inches. The half of the bill nearest the head is brown; the rest red. The corners of the bill are puckered into a kind of star. The legs and feet are orange. The plumage is black and white, with the exception of the cheeks and chin, which are sometimes grey. The young, picked with spines, are by some called the sanderling; they are also occasionally posted in the north.

Sprats are supposed to be the principal food of the puffin;
AULIC COUNCIL (Reichsobrath), the name once given to the personal council of the emperor of Germany, which was distinct from the imperial chamber, or Reichskammergericht, which was the supreme tribunal of the German empire. [See Imperial Chamber.] The Aulic Council consisted of a president, a vice-president, the vicemayor of the empire, and eighteen councillors, six of whom were always imperial councillors, and twelve provosts of the city of Strassburg, whose voting power was considered equal to that of all the rest. The nomination of the Aulic Councillors belonged to the emperor, who paid them, with the exception of the vice-president, a salary, or a pension. When a vacancy occurred, the names of the persons to be chosen were drawn from two classes, nobles and civilians. The affairs which were under the exclusive jurisdiction of this court were of three sorts: 1. Feudal processes concerning the immediate feudatories of the emperor; 2. Those called rescripts of courts, including appeals from the hereditary dominions of the emperor; 3. All matters concerning the imperial jurisdiction in Italy, as the emperor was styled King of the Romans. The investitures of counties of the German empire were given by the Aulic Council. The Aulic Council did not interpose in the political or state affairs of the empire. The Council ceased at the death of every emperor; and the new emperor made a fresh appointment. The decisions of the Aulic Council were submitted to the emperor for his approbation, by which they became law.

At the extinction of the German empire by the renunciation of Francis II in 1806, and the establishment of the Confederation of the Rhine under the protection of Austria, the functions of the Aulic Council were transferred to the grand council of the Congress of Vienna, which is styled Hofsregerath, and consists of twenty-five counsellors. The members also of the various boards or chancellories of state for the affairs of Bohemia, Hungary, and Transylvania, Italy, and Galicia, are styled Aulic Counsellors, but are inferior in rank to the councillors of state, of which latter two sat at the head of each board. [Austria as in London, 1872.]

AULIS. [See Euphros.] AULUS GELLUS. [See Gellius.] AUMALE, CHARLES DE LORRAINE, Duc d', sprung from a branch of the ducal house of Lorraine, which had settled in France about the beginning of the sixteenth century, when it was possessed of the fief of Aumale. His father, Claude d'Aumale, was governor of Burgundy, and uncle to Henry Duke of Guise, the head of the League. [See Guise.] Charles d'Aumale entered into the party of the League, which, under pretence of suppressing the Huguenots, aspired to the supreme power. He was the means of subjecting Picardy and Normandy to the League. After the assassination of the Duke of Guise, in December, 1563, he kept up an office as in the league, and the heads of their party. Aumale in 1569 took possession of Paris, from which King Henry III. had been obliged to retire, and he dissolved the parliament by force, and sent its members to the Bastille. Shortly afterwards he marched forward in France about the beginning of the sixteenth century, when it was possessed of the fief of Aumale. His father, Claude d'Aumale, was governor of Burgundy, and uncle to Henry Duke of Guise, the head of the League. [See Guise.] Charles d'Aumale entered into the party of the League, which, under pretence of suppressing the Huguenots, aspired to the supreme power. He was the means of subjecting Picardy and Normandy to the League. After the assassination of the Duke of Guise, in December, 1563, he kept up an office as in the league, and the heads of their party. Aumale in 1569 took possession of Paris, from which King Henry III. had been obliged to retire, and he dissolved the parliament by force, and sent its members to the Bastille. Shortly afterwards he marched forward.

AUSNIS, one of the former provinces or military governments of France of the time of Louis XIV. it was composed of those divisions. It was bounded by the ocean on the W. on the N. by Poitou, from which it was separated by the river Sèvre (distinguished as the Sèvre Niortaise), and on the E. and S. by the province of Saintonge. It is watered by the Sèvre just mentioned and the Charente. These rivers, rising in the more inland provinces, pass through Aunis in their course to the ocean. The soil is generally dry, but it produces corn, and grapes, from which good wines and brandy are made; while the marshy tracts afford pasturage for a large number of cattle. There is good iron, and there are frequent salt springs. There is little wood. The salt marshes, which are considerable, yield salt of the best quality; but their exhalations are prejudicial to the health of the inhabitants. The district is divided into 74 communes, of which 7 are seaport which it possesses, render it commercial and wealthy. The chief article of export is brandy; but the cod-fishery, and the colonial and coasting trade employ several vessels. The coast abounds in shell-fish, of species that are not very common; and the mussel-fishery (picole des secondes) brings in considerable profit. The salt is of three kinds, white, grey, and reddish; the first is the most esteemed.

The maps differ considerably in giving the boundaries of Aunis. Some contract the province so far as to exclude the town of Rochefort, which is on the northern bank of the Charente; while others make the Charente the southern boundary of Aunis, and so include Rochefort. The map given in the Atlas to the Encyclopédie méthodique extends the province still farther south to the Gironde; for the district of Brouage seems, which formerly appertained to Saintonge, was dismembered from that province and joined to Aunis, which thus included all the sea coast between Poitou and Guienne, together with the islands of Ré, Aix, and Oleron. The district of Brouage seems to be productive in salt, as also the isle of Oleron. The isle of Ré produces wine; but is ill-provided with wood, and is not of much importance.

The chief town of Aunis was La Rochelle; and to this we may add Rochefort and Marennes as next in importance.

The province is now comprehended in the department of Charente Inférieure (Lower Charente). (Mallet Brun; Encyclopédie méthodique, Géographie Moderne; article Aunis.)

AURANTIACEÆ, or the orange tribe, are dioecious, leathery, peltate plants, with dark-green leaved leaves, filled with fragrant essential oil collected in little transparent dots, and a superior ovary changing to a succulent berry, the rind of which is also filled with fragrant essential oil. No natural order can well be more strictly defined than the orange tribe, and none have properties more uniform and definite. It consists of trees or shrubs found exclusively in the temperate or tropical parts of the Old World, and unknown in a wild state in America; their flowers are usually odoriferous, and their flower and fruit 100% shade of yellow. They principally differ from each other in the number or proportion of arrangement of their stamens, in the number of cells or seeds in the fruit, and in the texture of the rind of the fruit, which does not always remain of the same solidity, and in the nature of their congegers, but is frequently a mere skin inclosing the pulp. The natural order which is most nearly allied to the orange tribe is that called Xanthorrhoea, into which the oranges pass by their climbing genus, Lovenopa, and which differ essentially in having a hard dry fruit which splits into several carpels.
AURE D', one of the 'Four Valleys' (Quatre Vallées) in Upper Armangne. [See ARMAGNAC, and PYRÉNÉES, HAIDA.]

AURÉ, a small river in Normandy, rising near the town of Mortagne, in the department of Orne, and flowing in a direction a little to the north of east, until it joins the Eure not far from Dreux. As its whole course is not much more than forty miles, it would not deserve notice, but for the circumstance that its stream was interrupted and its waters swallowed up in deep pits or abysses which occurred in its course. It is supposed by Desmarest (in the article 'Auré,' in the Encyclopædia Methodica, 'Geographie Physique'), that this absorption of the waters was consequent upon the accumulation of mud in the bed of the river, which caused the waters to overflow, and to work out for themselves subterranean channels. But whatever may have been the cause of the phenomenon, the mills on the stream were materially injured by the frequent failure of the water; and this injury led to the application of a remedy. The bed of the river was cleansed, the mud which had accumulated taken away, the pits by which the water was absorbed stopped up, and the orifices by which the water was absorbed in winter issued forth again, were made to empty themselves into the stream. (Encyclopædia Methodica.)

AURELIA, in entomology, a name given to that state of an insect which is between the caterpillar and its final transformation, and is commonly called a chrysalis or pupa. The term aurelia was first applied by the Romans, and that of chrysalis by the Greeks, to certain butterfly pupae which have a golden colour. In England, those of the peacock (Fossaon fo) and the small tortoiseshell (Faunus licaon) butterflies are beautiful examples, and may be seen in abundance hanging to the common stinging nettles by the latter end of the month of June. [For further account, see Pupa.]

AURELIANUS, LUCIUS DOMITIUS, is commonly said to have been born at Nîmes, in Panonnia; but the place of his birth is not distinctly ascertained, nor do we find the date of it exactly stated. His father was a husbandman; his mother priestess of a temple of the Sun. It was said, probably by the flattery of later times, that his subsequent elevation was procured by a variety of prodigies and omens. At an early age he enrolled as a common

soldier; tall, handsome, and strong, skilful and diligent in all athletic and military exercises, temperate in his habits, and of sound intellect, he rose from his humble station to the highest military offices, during the reign of Valerian and Claudian. It is a trifling circumstance, but not unworthy of notice, as illustrative of the qualities looked for in a personal at that time, to find the following effect in praise of his personal prowess:—

'Mille, mille, mille, mille, mille, mile, mille, decollavimus; Usum homo mille, mille, mille, mile, decollavimus; Mille, mille, mille virum, qui mille mile occidit. Transtum va habet nemo quantum futid sanguinis.' He was distinguised by the soldiers from another Aurelian, also a tribune, by the characteristic epithet 'sword in hand' (manci ad ferrum). As an officer, his discipline was strict even to severity. He wrote to his lieutenant, 'If you wish the tribune, or to live, keep the soldiers in order. Let no one steal another man's fowl, nor touch his sheep. Let none plunder grapes, nor injure corn-fields. Let none exact ee salt, or monies. Let each be content with his own rations. Let each get rich from the booty of the enemy, not from the tears of the provincials,' &c.

On the death of Claudius, honourably distinguished by the appellation of Gotho, a.d. 270, Quintilius, brother of Claudius, assumed the purple, but resided at Rome. The troops, at the end of seventeen days, on hearing that the legions of the Danube had raised Aurelian to the imperial dignity. The new emperor suppressed an inroad of the Suevi and Sarmaets, and compelled them to retreat to the northern side of the Danube; but he withdrew the Roman troops from the wines of Dacia, and thus doubly strengthened the frontier of the empire by rendering the Danube its boundary, and by abandoning a district too distant to be easily defended, and thinly peopled to defend. Thus, Julius, thus engaged, Aurelian was recalled to the north of Italy, an incursion of a German tribe, the Alemani or Marcomanni. After various alternations of success, among which we may notice a battle near Piacentia, in which the Roman troops were defeated, he placed the old rulers of the barbarians in his triumph, a.d. 271. Aurelian then visited Rome, punished with a severe violence the severity of the authors of a sedition which had disturbed the city, and repaired the walls, including an additional space within their limits. The disturbances at Rome were owing to the 'Monetarii,' a body of men explained by Ptolemaeus to be the coiners, a set numerous and united enough to raise seditions; to support which, he refers to the passage of Eutropius (lib. ix.).

A. Victor also says that the 'Monetarii rebellaviunt,' got up a rebellion. These men were not only the inventors of the coinage, which they had probably debased for the sake of their own profit. We know that Aurelian afterwards issued a new and improved coinage. See Gibbon (ch. x. sect. 8).

Aurelian, in this time, was master not only of the central portion of the Roman world. Under the weak and contemptible princes who preceded the energetic reign of Claudius, Aurelian, a multitude of contempors for empire started up, who fell one before another, or maintained, in these several districts, a short and anomalous independence. Of these, the last and most powerful were Tetricus and Zenobius, who respectively held the exterior and interior of the Roman empire. Spain, Gaul, and Britain owned, in name, the sovereignty of Tetricus; but he was little more than a pageant of a monarch, in seeming possession of a power which he could not wield, and which wheresoever he turned his face to relieve him from this splendid misery, and betrayed his own army into a defeat near Châlons, in Champagne, where he himself, with a few friends, took refuge with his more fortunate competitor. Spain and Britain acknowledged the reverse places these events in the year 271, contrary to most other historians, who make them subsequent to the fall of Zenobia. (See Vopiscus, cap. 35.)

The west being secured, Aurelian bestowed himself to that war which was the result of the issue of the war of 271; the reduction of the great, flourishing, and short-lived city of Palmyra. (See Palmyra, OEBNATHUS, ZENOBIA.) Oebnathus, who had raised his native city to the height of power, was dead, and succeeded by his widow, the empress Zenobia, a woman of high birth and masculine talents. The march of Aurelian was easy as well as toilsome. In his route through Illiria and Thrace
he met and vanquished some of the barbarian hordes who infested the frontier provinces of the Roman empire. Passing through Byzantium, he traversed Bithynia. Ancyra (in Galatia) submitted; Tyana was besieged and taken; and Antioch opened its gates after a slight skirmish at Daphne. This is the statement of Vopiscus; but Eutropius speaks of a severe battle at Antioch, and makes no mention of that fought at Emesa. The hostile armies met at Emesa, in Syria, where Aurelian gained a decisive victory, and continued his march to Palmyra unmolested, except by the constant attacks of the Syrian robbers, from whom much inconvenience was sustained in crossing the deserts. The resistance of the city did not argue its fate; and almost at once, Aurelian, in person, entered it, and took it by assault. Vopiscus has preserved a letter from Aurelian himself, in which he complains that the Romans talk of his waging war with a woman, as if she fought with her own unassisted strength, and continues, 'It cannot be told what preparation for war, what store of arrow, spears, lances, was here. No part of the wall but was occupied by two or three battalions, and there are engines to cast fire. She does not fight like a woman, nor like one who fears punishment. But I trust that the gods will assist the republic, who never have been wanting to our undertakings.' He offered favourable terms of capitulation—an honourable retreat to Zenobia, and the reservation of their rights to the Palmyreans; but a haughty answer was returned by the queen, in the Syrian language, reminding him that Cleopatra, when she lived like a queen, and threatened him with the promised help of the Persian, Saracen, and Armenian. But Zenobia was disappointed in her expectations about these auxiliaries; and the skilful commissariat arrangements of the emperor overwhelmed the paltry army with famine. The Persians were not of much service to the army in the inhospitable deserts which surround the oasis of Palmyra. Zenobia felt resistance to be hopeless, when Probus, to whom the re-conquest of Egypt had been entrusted, approached her in a victorious aspect, and to the assistance of the emperor; and she tried to escape, but was intercepted on her way to Persia, and brought to the Roman camp. The soldiers clamoured loudly for her death. Aurelian refused to shed female blood; but he took his revenge on the Persian king, who had dethroned Longinus, whom he had persecuted the celebrated Longinus, who had been Zenobia's instructor in Cretan literature. The city surrendered soon after the capture of its mistress, A.D. 273, and was treated with comparative clemency, being neither plundered nor destroyed.

Aurelian was already returned into Europe, when he heard that the Palmyreans had revolted, and massacred the small garrison of six hundred archers whom he had left at Palmyra. He resolved to revenge, as he exceeded even his usual ferocity in revenging this ill-judged insult. There is a letter extant written by him to Coenion Bassus, in which he says, 'The sword must go no farther; enough of the Palmyreans are slain and cut to pieces. We have taken possession, habits, and unclean acclamations, which it is honourable to the emperor to have perceived and cherished; he owed his adoption into the Aurelian family by Antoninus Pius, who was himself adopted by Hadrian, upon condition that he should adopt Annius Verus, and the son of a deceased favourite, L. Coenius Commodus (called, after his adoption by Hadrian, Allius Verus Cæsar, who was to have been his successor; this son was named Lucius Verus. [See Verus.] There was policy, as well as family connexion, in these proceedings. The father of Aurelius was dyin; while he was young, his grandfather took charge of his education, and gave him every advantage which the age he lived in could afford. We learn from himself that he had masters in every science and polite art, whose names and qualifications he has most gratefully recorded, modestly attributing all his acquirements to their instruction and example. (See Book I. of the Meditations.) They were all more or less remarkable for rigid observance of the rules of morality, command of temper, polite conversation, and courteous manners, and were all afterwards rewarded according to their merits and just expectations, two of them being raised to the consulate. These men, therefore, were not only tutors, but models upon which the more perfect character of Aurelius was formed; the foundation of which, however, he piously says was laid by his parents. From what he had heard of his father, he learned modesty and manly firmness; from his mother, piety, generosity, and simplicity of life; from his grandfather, virtuous disposition of mind, and

were those whose stations gave them a right to be near his person; he was murdered in October, 274 (in 275, according to Vopiscus and Aurelius Victor). Gibbon, without quoting his authority, makes it four years and nine months. He left a single daughter, whose descendants remained at Rome when Vopiscus wrote.

Aurelian is not ill-described by Eutropius as of a character 'necessary on some occasions rather than loveable on any; but harsh on all.' Yet he had many qualities noble and valuable in a ruler; he was frugal in his expenses, temperate in his pleasures, moderate in providing for friends and adherents, strict in preserving good order, and resolute in repressing peculation, and punishing those who grew rich on peculation and the spoils of the provinces. But these great qualities were obscured by a temper naturally harsh, and trained by a long and exclusive course of military service into total carelessness for the sufferings of others; insomuch, that the Emperor Diocletian, himself not over inclined to compassion, said on that account that Aurelian was better suited to command an army than an empire. (Vopiscus, in the Historia Augusta; Eutropius; Aurelius Victor; Gibbon, c. xi; Crevier, Histoire des Empereurs Romains, vol. vi.)

Vopiscus informs us (cap. I.) that his Life of Aurelian was founded on Greek authorities (there having been no Latin history of Aurelian before his), and on the Journals and Campaigns of the emperor, which were then kept in the Ulpian Library at Rome.
habital command of temper, &c. For the art of government, and the manners that give dignity to a ruler, he afterwards studied the public and private conduct of Antoninus Pius. His teachers were former. One of those distinguished of them, Rusticus, procured him a copy of the works of Epictetus, which confirmed his natural inclination to Stoicism, and became his indispensable companion; he delighted in commenting upon them, and thanked the gods that he had found a manuscript which he could collect wheresoever to conduct his life with honour to himself and advantage to his country. The life and writings of the emperor rank him, indeed, amongst the best teachers and historians of the stoic school, and have led his biographers to expatiate upon its merits. It would be out of place here to do more than to acknowledge the general excellence of its moral rules, and their universal application as a system of moral philosophy to the use of men of all ranks and conditions in society. From this circumstance, Stoicism had more followers than any other philosophical sect. Much has been said of its extreme severity: perhaps from some of its followers having overstated its rules, and adopted practices more rigid than are consistent with nature and conformable to reason; but such men are ascetics, and not Stoics. But, admitting its rules to be laid down in an extreme manner, they stand upon the same footing as certain theories in the exact sciences that find their natural limits in practice. In the lives of Epictetus and Aurelius, the just limits of the rules of Stoicism, and the proof of their utility to men of all conditions in life, may be found. They were equally adapted to the purposes of these two men, whom we may link the example of the social life. The one was the slave of a man freed from every slavery but that of his own vices by Nero, living in the worst of times, with the worst examples immediately before his eyes, and trusting to chance and his own exertions for education. The other was not only a freeman, but born to command, and enjoying every advantage; yet there is nothing in the lives and practices of these two men contrary to nature and social order, and little or nothing more to be required of either of them than what they performed. They were equally remarkable for their social and intellectual conversation every respect; and they have each left us the rules by which they governed themselves. (See ARrian, and EPictetus.) The work of Aurelius, which is divided into twelve books, and written in Greek, is generally known by the name of his Meditations. There has been much unnecessary caraviling about its Greek title, ῥωθ ἐγέρων, variously rendered 'of' and to himself, or 'concerning himself.' It is a private note-book, kept for a purpose that the critic would have been better employed in clearing out great works. Aurelius accomplished the arduous task of passing through a life of extraordinary difficulty and temptation with unblemished character. His son entirely failed in it, not from disability, for he was educated and trained at Stoic schools. His son related every part of his steps, till he became free from his father's observation and control; till then he must have given satisfaction, for his father thanks the gods that he had found proper tutors for his children. We must therefore infer that education and natural inclination are not of themselves sufficient to keep a man in the paths of virtue without an reuniting discipline. The severest and most important rule of Stoicism relates to self-government, and enjoins daily and hourly examination of all our thoughts, words, and actions. This golden rule is also the monastic principle. Aurelius always observed it, as his book proves; it was his monaster to keep him to his duty; it fully illustrates the efficacy of stoical discipline, and its effect upon the man himself gives it its title. Hence are the title, the bacteria of his education, and a collection of rules, dogmas, theories, comments, and opinions, put down as they were suggested by passing events, reading, or conversation; sometimes they appear to be preparatives for particular cases in which he expected to be called upon ad hoc. They form no regular series, nor have they any relative order, but they all tend to the purposes of morals, discipline, and self-government. When not new, they are placed in a new light. They may be considered as a supplement to Epictetus, and are, as it were, a collection of maxims of discipline left to us by the ancient philosophers. This book was first edited in Greek and Latin by Xylander, Zürich, 1554, then by M. Cassaubon in 1643, much improved; but still more by Gotschen, Camb. 1645, with some valuable tables of reference. It was re-edited by O. Stanhope, with Dacier's life.

Lond. 1637, 1704. An edition by J. M. Schultz was published at Schleswig, 1805; and another by Coray, Paris, 1816. The English translations are by M. Cassaubon—seven editions between 1634 and 1702; the reader is confused by his explanations of his own language as he goes on: by J. Collier, remarkable for its vulgarity; by J. Thomsen, 1747. Anonymous, Glasgow, 1749, harshly literal; and by R. Graves, 1792, said to be the best, but very bad.

The events of Aurelius's life are marked by wise and prudent conduct. He passed through all the offices usually given to persons of his rank and pretensions, and as he most punctually attended to his duty in them, he obtained those facilities as a man of business for which he was remarkable. In his fifteenth year the daughter of Commodus was betrothed to him by the desire of Hadrian, but the union was dissolved by Antoninus Pius after Hadrian's death. His adoption by Antoninus Pius took place in his eighteenth year, when he was named Marcus Aurelius Aurelius. After the death of Hadrian he married his cousin Faustina, daughter of Antoninus Pius, a lady whose conduct was not calculated to promote his happiness, and though he had ample cause, he refused to divorce her. Upon the death of his new father in 161, he took the same title of Antoninus, and immediately associated Lucius Verus with himself as partner in the empire; he also gave his daughter Lucilla in marriage. This last and highest office Aurelius accepted at the request of the senate, much against his inclination; but having accepted it, he never suffered his firmness for study and philosophy to interfere with his public duty. A troublesome reign ensued, beginning with inundations, earthquakes, famine, and pestilence, causing universal distress, which it required extraordinary exertion to alleviate. The life of a man whose object was peace was almost entirely occupied by war, owing to former emperors having conquered more countries than they could unite in one empire. This was only making as many enemies, open and concealed, as conquerors. The safety of the empire, however, now depended upon its keeping all its provinces, for its inability to do so could be proved, common cause would be made against it, and its destruction would follow. Hence it became the duty of Aurelius to put down the insurrections that broke out in all quarters. This he did by activity, fortitude, and a prudent choice of his lieutenants; he was everywhere victorious; and he took the best means in his power to make his victories effective, by showing severity and clemency to conquered, endeavouring thereby to prove that he was a ruler under whose sway men might live in peace if they pleased. But the spirit of liberty and independence on the frontiers could not be suppressed; all that Aurelius could do was to maintain the integrity of the empire during his reign, leaving the same hopeless task to his successors.
The calamities in Italy were not ended when the Parthian war broke out. Verus took the command in this war, and returned victorious, A.D. 166, but brought the plague with him to Rome. (See Verus.) Calpurnius Agricola was sent against the Britons, who threatened invasion; and Aurelius Victorinus against the Catti. The two emperors soon after marched together against the Marcomanni, and obliged them to sue for peace. In returning from this expedition Verus died, n.c. 169. In the year 174 Aurelius was compelled by the Goths who made many annoyance. During this campaign a battle was fought with the Iazyges on the frozen Danube: and in the year 174 an event happened which has given rise to much controversy, though we have no precise account of it. Scala, the son of Aurelius, being unwarily drawn into a defile by the Quadi, was nearly overcome by the attacks of the enemy, whom, from the nature of the place, the Romans could not resist, as well as from fugitiveness, the unskilful manner in which he handled the water, which they had not tasted for some days. From this difficulty they were suddenly relieved by a violent storm, that fell lightly on them, and gave them an opportunity of refreshing themselves, while it directed its fury against some kind of prophecy, knowing how to say, as some say, the lightning, to which others add wildfire, actually destroyed them. The Romans took advantage of the cross, and gained a victory. Upon this, some unlucky legende, not knowing that the 15th or Thundering Legion, although it was in this climate, happened to occasion to call it a Christian Legion, and to attribute the miraculous storm to the efficacy of its prayers: and a letter exists from the emperor to the senate acknowledging the fact. This letter is in Greek: no Latin copy has been discovered. It is not authenticated and nobody will believe that Aurelius would insult the senate by writing in a strange language, though it may be argued, as it has been, that this is only the substance of the pertinent communication, and not to be considered as the original. (See the letter in D'Acier's Life of Aurelius, Stanhope's ed.) But the internal evidence of the letter is perhaps sufficient to destroy its credit. The heathens are also said to have acknowledged the miracle, and to have attributed it to the two of their gods. (See Perseus, Hist. Rec. iv. 13.). Some attribute it to Antoninus Pius: but the charge of persecution is still maintained against Aurelius, especially in the case of his son, who published no edict against them. Marcus certainly appears not to have liked the Christians, perhaps he even hated them. (See Moch. xi. 3, and Gataker's note.)

During his long northern campaigns Aurelius crossed the Danube and engaged the Sarmatians and the Saciarii. His victories are commemorated on one of the medals which we have given. But the rebellion of Avidius Cassius in the east compelled the Emperor to return to Rome, and to leave the barbarians of the north in a more powerful position than was convenient for the frontiers.

The Clemency, justice, and sound policy of the Emperor were particularly shown in this rebellion of Cassius (A.D. 175), who, after a feeble and unsuccessful attempt to get possession of the empire, was put to death by his own officers. He would not extend the usual penalties to his family, nor suffer many of his accomplices to be punished; he even destroyed his private correspondence, that none might live in fear, and be induced to continue in rebellion as their only safety. He left the whole matter to the senate, as if it had been an ordinary affair, recommending the greatest clemency, as he was most desirous of freeing himself from all imputation of revengeful feeling. (See Cassius, Avidius.)

After the death of Cassius, the Emperor made a journey into the east in order to restore tranquillity, which had been somewhat interrupted by the rebel Cassius. In his visit to Lower Egypt and Syria, he reconciled the good-will and affection of his various subjects by his kindness and his amiable manners. During his return through Asia Minor, his wife Faustina, who accompanied him, died at a castle called Halaie, at the foot of Mount Taurus. By her infidelity to the Emperor he was generally beloved, the good-natured prince, who either knew nothing of it or took no notice of it, lamented her loss as if she had been the last of wives; and the Senate, in the usual style of adulation, decreed that the temple to her was to be adorned with divine honours with the title of Diva. Aurelius also instituted a new establishment for young ladies under the title of Nova Fuelle Faustinine, in imitation of that which was created by Augustus for the mother of the empress. (See Antoninus.) We should not omit to mention, in opposition to the accounts of Capitoins and Dion Cassius, that the emperor extols the obedience, affection, and simplicity of his wife. (Mediat. l. 17.)

Titus Smyrna was the recipient of the display of the rhetorical talents of Aristides, who pronounced on that occasion his declaration in praise of Smyrna, which still exists among his works. Two years afterwards, when Smyrna was ruined by an earthquake, Aristides prevailed with the Senate to name him its ambassador to his own city and to the same bounty that he had already bestowed on other cities. (See Aristeides, Alcius.)

From Smyrna Aurelius passed to Athens, where he appears to have been admitted into the sacred mysteries of the Eleusinian Mysteries. During this visit he published a new antithetic code of law, which was his book on the subject of the ancient seat of learning by founding chairs of philosophy for the four chief sects, the Platonists, Stoics, Peripatetic, and Epicureans; and also a professorship of rhetoric.

The close of the year was signalised by the publication of a new campaign against the Marcomanni, Hermunduri, Sarmatians, and Quadi. His son Commodus accompanied him during these campaigns, which appear to have lasted between two and three years. (See Perseus, Hist. Rec. iv. 13.) After a short illness, at Vindobona (Vienna), in his fifty-ninth year, having reigned ten years alone, and nine with his colleague. His loss was regretted by the whole empire; he was ranked amongst the gods, and every house in the senatorial order, and a statue of his appeared in the temple of Augustus to the appointment of Julian to govern Gaul, A.D. 356. 4. De Vita et Moribus Imperator Romano-rum, or Aurelii Victoris Epitome, another history of the emperors, from Augustus to the death of Theodosius the Great, a.D. 7.18.

All these are not written by the same person is generally acknowledged; by whom they are written it is harder to say. It is pretty well agreed that the 'Origines' is not written by the same person as the 'Illustrissimi', or the 'Cassarum', and some of the materials which have attributed it to Asconius the critic. The 'Illustrissimi Men' has been variously ascribed to Cornelius Nepos, Pliny the Younger, Suetonius, and the true Aurelius Victor, who is the unoubted author of the 'Cassarum'. Of his life barely six things are certain: De Cassar. vi. 5, that he was born in the country, of a poor and unlearned
Charles XII, himself soon after reappeared upon the scene; but all his heroism was less successful to the allies than it had been to the enemies, the Count de Goertz, who almost succeeded in subverting the existing alliances between the European states. He had nearly dissolved the bond between Augustus and Russia, when the death of Charles XII, occurring on his way to Congress, led to a conclusion the structures of war and of political intrigue.

The restoration of Augustus to the throne of Poland assassinated the ill of that unhappy country. If Stanislaus had been raised to the throne by the dictation of a foreign power, Augustus was a firmer, more relied upon Russian support, and who first placed the country at the mercy of surrounding states. Unable to rely on the Poles, Augustus endeavored to defend his authority by skillful manipulation of. Every thing succeeded; and the means by which these were terminated were as disastrous as the ill they remedied. It was first decided that the Saxon soldiers should evacuate the country; and on the other hand it was agreed, under the crafty mediation of Russia, that the national army of Poland should be reduced, from near 100,000 to the insignificant force of about 20,000 men. 'These measures of Augustus,' says Maizerowski, 'brought peace to Poland; but it was the peace of Cadiz.'

The interval between 1718, the year of Charles XII's death, and that of Augustus, which took place in 1733, passed away without being marked by any remarkable incidents. The unsuccessful effort of Augustus to secure the throne of Sweden for his eldest son was his only attempt at active policy. A marriage between the king's eldest son and an archduchess of Austria was an opportunity for Augustus to display all his magnificence. The King of Saxony, anxious to be reassured by the European court, diamonds and embroidery had never been seen in greater perfection. But the good people of Dresden could only look with discontented eyes on a scene of magnificence, cruelly contrasted with their own recent and present misery. In addition to this, the recantation of the young prince, and the fear shown by the king to the Jesuits and high Catholic party in Poland, filled the Lutheran population of Saxony with anxious fears for their religious liberties.

Augustus was not beloved by his subjects in either of his kingdoms; each complained that they were sacrificed to the other, while, in reality, both were sacrificed to the vain-glory of the prince. In Saxony, however, his profligacy was favourable to the arts; and the porcelain manufacture of Saxony (the rage with the princes of that day) may be said to have been founded in his reign. Poland had not even this trifling recompense. Such were the miserable results of the reign of a monarch who possessed personal excellence and the highest and mental talents in no mean degree. Like Louis XIV, his model, he was the hero of courtiers rather than of soldiers—beginning his career with mighty plans of empire, and saved at length from ruin merely by the kindness of fortune. At once a gallant courtier and a dandy, his personal qualities tempered the run of the kingdoms over which he ruled, while the gorgeous luxury and far-famed magnificence of his person and his court rather aggravated than diminished the mediocrity of his reign.

AUGUSTUS III, son of Augustus II, elector of Saxony and king of Poland, was born at Dresden in 1696. His father, wishing to give him the same accomplishments that he had learned himself, sent him in 1711 to visit the different countries of Europe; but his education from his travels only the love of idleness and pleasure. He returned 'still, indolent, and backward,' says the historian of Saxony; 'good natured, indeed, which served to make up for his defects, the father had at least an aim, in which he may have failed; but the son had neither aim nor purpose to fail in.'

The death of his father in 1733 made Augustus elector of Saxony, and left him at the same time the strongest position in Poland. A Protestant, the Polish nation shrank, it is said, from striving to attain this unsalutary monarchy; but his wife, a daughter of Austria, supplied her husband with ambition, and Augustus became a candidatel to the crown. He was supported by the courts of Vienna and St. Petersburg, and, in 1733, was elected king of Poland. He had yet to be confirmed as King of Saxony and Emperor of the Holy Roman Empire. In 1734 he succeeded to the throne of Poland, and on the 15th of August was crowned in Warsaw. The Polish parliament, however, refused to recognize him, and the king was obliged by France to accept the death of his father. The Poles were meantime engaged in a war with Russia, and the election of Augustus. His competitor Stanislaus was obliged to fly and take refuge in Austria, which he was compelled eventually to abandon, along with his pretensions to the throne of Poland. Augustus, although crowned at Cracow in the commencement of 1734, did not become undisputed monarch of Poland till after the Diet of Partition, held at Warsaw in 1736. Though oppressed by foreign troops, the Poles showed themselves jealous of their king, and constantly watching the approaches of foreign enemies, and for the maintenance of only 1200 Saxon guards within the kingdom. Augustus yielded; and half reluctantly, Poland once more submitted to a Saxon prince.

Up to the time of his accession, Augustus had bestowed his confidence chiefly upon the old companion of his travels, Bulow: but this favourite was superseded by another, Count Bruhl, who henceforth monopolized all authority in Saxony and Poland. Mutual spoliation was the consequence of this. To the south thought of Saxony, the rise of Prussia excited the jealousy of the Saxon house, and insted its ministers one day to oppose Prussian aggression, the next day to imitate it. The probable dissolution of the Austrian empire after the death of Charles the VI, however, gave him an opportunity to establish himself as a new centre of commerce and manufacture. His designs were carried forward by Count Pius Wolfskis's project to conquer Bohemia for Saxony. Bruhl at first abandoned this scheme and league with Austria to support the succession of Maria Theresa. In a little time, however, he was able to obtain the ministerial design, and to scheme the succession of his son-in-law, Frederick, who was to be made master of Silesia. Augustus acquiesced. The Saxon and Prussian troops fought in alliance, but had not been long in the field, when Augustus learned of his minister's death. He at once strengthened Frederick. Soon after, in 1743, an alliance was concluded at Warsaw between England, Saxony, and Austria, for the defence of the house of Hapsburg. The king of Prussia, however, had 10,000 men in Saxony, and it was necessary to oppose him, and make himself master of Dresden, December, 1743; whilst Augustus, with his minister, took refuge in Poland. The truce of 1746, however, restored to him the electorate; and at the same period took place the marriage of Augustus's daughter, Maria Josepha, with the dauphin of France: a marriage from which sprung Louis XVI, Louis XVIII, and Charles X., the present exiled king of France.

The possibility of coping with Prussia, already proved the defeat of the Saxons and their allies, could not keep Augustus or his minister from leaguing once more against Frederick, and even planning to share that monarch's territories with Russia. In consequence of this, Frederick united Saxony and Brandenburg into a federal state, and took the entire Saxon army in its intrenched camp at Prenzlau. Augustus again fled to Poland.

His reign in this latter country was as pernicious as in Saxony. If Saxony was humbled in its pride, stripped of its resources, and ravaged by invading armies, Poland suffered equal injury, though less violence. It was allowed to sink into what Ruhlher calls 'a tranquil anarchy.' Its debts, which were seldom held, were never allowed to come much to a head. The revolution of the Placards in 1738, the republic, Augustus, who was passionately fond of the chase, preferred the well-stocked forests of Saxony to the plains of Poland.

Saxony itself having fallen into insolvency, its monarch became a state of dependence, being Russian, and St. Petersburg became the capital, to which the Pole resorted, rather than to Dresden. Though the supremacy of Russia was allowed silently to establish itself in Poland under the empty government of Augustus. Peoples, preserved. Peace, and order, however, were the only consequences. For his father what Louis XV. was to Louis XIV.; except that Augustus III., though prodigal and luxurious, was no sensualist. Ruhlher even reproaches him for his stupid even to his officers and soldiers, and taking it for his historian's own ideas of morality. Augustus III. ascended at Dresden, in October, 1763.
birds of the family Alcas, known scientifically as species of the subgenus Alca, Pratercula, Mergus, and Phalaeis.

Subgenus Alca.

The true Aucks, those we see strictly oceanic birds, are not seen except for the purposes of reproduction, will sometimes proceed swiftly, though awkwardly, on foot when pursued on land. They breed in large colonies, in caverns and rocky cliffs, laying only one disproportionately large egg. Their food, which they obtain by diving (an operation in which they are materially assisted by their wings as well as by their feet), consists of small fishes, crustaceans, and other marine animals. The young are said to be fed from the crops of the parents, not only before they are able to leave the place of their birth, but also for some time afterwards.

The genus Alca, as it is reduced by modern ornithologists, includes but two species, apparently incongruous. The first of these, the Great Auk (Alca impennis, Linn.) remarkable for the imperfect development of its wings, seldom leaves the arctic circle and the regions bordering on it, and it is a rare visitor to the British isles. Dr. Fleming, however, gives an account of one taken alive at St. Kilda.

[Alca impennis]

(where they are sometimes known to breed), which, even with a long and heavy cord tied to its leg, swam under water with extraordinary speed. The power of the apparently useless wings as organs of progression was still more strongly shown in the Great Auk chased ineffectually by Mr. Bullock during his tour to the Northern Isles; for the four oars of the bird are said to have left the secured boat of his pursuers far behind. According to the same authority, only a single pair had been known to breed in Pape Westray for several years. Newfoundland is recorded as one of their breeding places, and Pennant relates that the Equim aesthetics who frequented the island wore clothing of their skins. In the ocean that washes the Feroes Isles, Iceland, and Greenland, where they dwell in great numbers, they may be frequently seen on the floating ice; but Pennant says that they are observed never to wander beyond soundings, and that seamen direct their measures according to their appearance.

The feet of the Great Auk consist principally of fish; and the Lump-fish (Cyclopterus lumpus) is said to be its favourite morsel.

The length of the bird is somewhat under three feet. The winter plumage, which begins to appear in autumn, leaves the cheeks, throat, forepart, and sides of the neck white. In spring, the summer change begins to take place, and confines the white on the head to a large patch, which extends in front and around the eyes; the rest of the head, the neck, and upper plumage is of a deep black. There is a specimen of the bird in its summer dress, in the British Museum, with 'Pape Westra' on the label. The Great Auk breeds in June and July, laying one egg, about the size of a swan's, of a whistful-yellow, marked with numerous lines and spots of black, which have been supposed to bear some resemblance to Chinese characters.

In the Black-billed Auk, Razor-bill, or Murre (Alca torda, Linn.), the development of the wings is carried to the usual extent necessary for the purposes of flight, though the bird uses them with great effect as oars when swimming under water.

The northern hemisphere, where they are widely diffused, is the portion allotted to these birds; but it is in the higher latitudes that they swarm. In England, the Needles, and other adjacent precipitous cliffs, have a fair share of them; and here, as in other places, the 'dreadful trade' of taking their eggs, which are esteemed a delicacy, for salads especially, is carried on. In Ray's Willoughby, the habits of the Razor-bill are thus described: It lays, sits, and breeds up its young on the ledges of the craggy cliffs and steep rocks by the sea-shores that are broken and divided into many as

[Alca torda]

it were stairs or shelves, together with the Collerneb and Guillemon. The Manks-men are wont to compare these rocks, with the birds sitting upon them in breeding time, to an apothecary's shop—the ledges of the rocks resembling the shelves, and the birds the pots. About the Isle of Man are very high cliffs, broken in this manner into many ledges one above another, from top to bottom. They are wont to let down men by ropes from the tops of the cliffs, to take away the eggs and young ones. They take also the birds themselves when they are sitting upon their eggs with snares fastened to the tops of long poles, and so put about their necks. They build no nests, but lay their eggs upon the bare rocks.

On the coast of Labrador they abound, and the thousands of birds there killed for the sake of the breast feathers, which are very warm and elastic, and the quantities of eggs there collected, amount to almost incredible numbers.

The summer and winter dress of the Razor-bill, though different, do not vary so remarkably as the plumage of many other birds. In the summer dress, the white streak which goes to the bill from the eye, becomes very pure; and the cheeks, throat, and upper part of the front of the neck are a deep blackish, bordered with reddish. In winter, the throat and fore-part of the neck are white.

The young of the year is, by the best authorities, supposed to be the Alca Pica of Gmelin.

The Razor-bill is little more than fifteen inches long. The egg (for they lay but one) is very large in proportion to the bird, being about the size of that of a turkey, but of a longer shape, pointed towards the smaller end, white or sometimes yellowish, blotched, and streaked with dark brown, chiefly towards the larger end.

Subgenus Pratercula.

Leaving the true Aucks we come to the genus Pratercula Briss. (Mornon. Illugu.), of which the Labrador Auk, common Puffin, or Collerneb, Pratercula Arctica, Mornon O 2

(Auka tods.)
but there is little doubt that other fishes and crustaceans are acceptable to the bird.

Subgenus Mergusulus.

The Little Auk, Common Roach, or Sea Dove, Mergusulus Melanoleucus of Ray, Uria Alia of Temminck, and Alia

[Fratercula Arctica.]

Fratercula, Temm., Alia Arctica, Linn., may be taken as an example.

Seldy gives the following account of the habits of this bird, and is corroborated by others who have written on the subject: 'Although the puffin is found in very high latitudes, and its distribution through the arctic circle is extensive, it is only known to us as a summer visitant, and that from the south, making its first appearance in the vicinity of its breeding stations about the middle of April, and regularly departing between the 10th and 20th of August for the southern coasts of France, Spain, and other parts of Europe, where it passes the remainder of the year. It breeds in great numbers upon Fiordholm Island, off the coast of Anglesoo, on the Isle of Man, and most of the islands, indeed, of the English and Scottish coasts. Many resort to the Feroe islands, selecting such as are covered with a stratum of vegetable mould; and here they dig their own burrows, from there not being any rabbits to dispossess upon the particular islets they frequent. They commence this operation about the first week in May, and the hole is generally excavated to the depth of three feet, often in a curving direction, and occasionally with two entrances. When engaged in digging, which is principally performed by the males, they are sometimes so intent upon their work as to admit of being taken by hand, and the same may also be done during incubation. At this period I have frequently obtained specimens, by thrusting my arm into the burrow, though at the risk of receiving a severe bite from the powerful and sharp-edged bill of the old bird. At the farther end of this hole the single egg is deposited, which in size nearly equals that of a pullet, and, as Pennant observes, varies in form; in some instances one end being acute, and in others both equally obtuse. Its colour when first laid is white, but it soon becomes soiled and dirty, from its immediate contact with the earth; no materials being collected for a nest at the end of the burrow. The young are hatched after a month's incubation, and are then covered with a long blackish down above, which gradually gives place to the feathered plumage, so that at the end of a month or five weeks they are able to quit the burrow, and follow their parents to the open sea. Soon after this time, or about the second week in August, the whole leave our coasts, commencing their equatorial migration. At an early age the bill of this bird is small and narrow, scarcely exceeding that of the young Razor-bill at the same period of life; and not till after the second year does this member acquire its full development, both as to depth, colour, and its transverse furrrows.

In rocky places (Dover cliffs for instance), they deposit their single egg, as Montagu observes, in the holes and crevices. The length of the bird is about twelve inches. The half of the bill nearest the head is bluish, the rest red. The corners of the bill are black, the legs and feet are orange. The plumage is black and white, with the exception of the cheeks and chin, which are sometimes grey. The young, pecked with spars, are by some called dainties; they are also occasionally potted in the north.

Brips are supposed to be the principal food of the puffin;
AULIC COUNCIL (Reichshoheit), the name once given to the personal council of the emperor of Germany, which was distinct from the imperial chamber, or Reichskammergericht, which was the supreme tribunal of the German empire. [See Imperial Chamber.] The Aulic Council consisted of a president, a vice-president, the co-chairman of the council, and eighteen councillors, six of whom were chosen by the Holy Roman emperor, those chosen by the emperor, when unanimous, were considered equal to those of the rest. The nomination of the Aulic Councillors belonged to the emperor, who paid them, with the exception of the vice-president, who was appointed by the Holy Roman emperor, from the highest ranks, from the nobility and the gentry. There was no question of the independence of the Aulic Council. The Council ceased at the death of every emperor; and the new emperor made a fresh appointment. The decisions of the Aulic Council were submitted to the emperor for approbation, by which they became law. Kühler, in the first volume of his Memoirs, compares the Aulic Council to the old French Parliament, with this difference, that the former could not make remonstrances to the sovereign, and did not register any other acts but its own deliberations.

At the extinction of the German empire by the renunciation of Francis II. in 1806, and the establishment of the Confederation of the Rhine under the protection of the French empire, the Aulic Council was abolished.

There is, however, an Aulic Council at Vienna for the affairs of the war department of the Austrian empire; it is called Hofkriegsrath, and consists of twenty-five councillors. Some of the various boards or chancelleries of state are for the affairs of Bohemia, Hungary, and Transylvania, Italy, and Galicia, are styled Aulic Councillors, but are inferior in rank to the councillors of state, of which latter two sat at the head of each board. (Austria at the Congress of Vienna, 1812.)

AULIS. [See Eorpois.

AULUS GELLIUS. [See Gellius.

AUMALE. CHARLES DE LORRINA, DUC D' Aumale, from a branch of the ducal house of Lorraine, which had settled in France in the sixth century, when it was possessed of the seat of Aumale. His father, Claude d'Aumale, was governor of Burgundy, and uncle to Henry Duke of Guise, the head of the League. [See Guise.]

Charles d'Aumale entered into the party of the League, which, under pretence of suppressing the Huguenots, aspired to the supreme power. He was the means of separating Picardy and Normandy from the League.

After the assassination of the Duke of Guise, in December, 1560, he was the first of the cardinals and bishops of France to enrich his followers by the revenues of his benefices. D'Aumale in 1569 took possession of Paris, from which King Henry III. had been obliged to retire, and he dissolved the parliament by force, and sent its members to the Bastille. Shortly afterwards he marched from Paris to Normandy, and was defeated by the Countess of Paris at the battle of Ivry, he left the capital. After the surrender of Paris to Henry IV., D'Aumale joined the Spaniards, who had invaded the province of Picardy, for which he was afterwards guilty of the most atrocious cruelties, and sentenced to be broken on the wheel, which sentence was executed in effigy the 24th of July, 1595. D'Aumale, however, continued to reside abroad, chiefly at Flanders, enjoying the favour of the Spanish government. He died in Brussels in 1631, in the seventy-seventh year. (Leclerc, Histoire de France pendant les Guerres de Religion.)

AUNIS, one of the former provinces or military government of France; it was attached to the French kingdom, and was placed in those divisions. It was bounded by the coast on the W., on the N. by Poitou, from which it was separated by the river Sèvre (distinguished as the Sèvre Niortaise), and on the E. and S. by the province of Saintonge. It is watered by the Sèvre just mentioned and the Charente. These rivers, rising in the more inland provinces, pass through Aunis in their course to the ocean. The soil is generally dry, but it produces corn, and grapes, from which good wine and brandy are made; while the marsh-y tracts produce a pasturage of the most excellent kind. There is little wood. The salt marshes, which are considerable, yield salt of the best quality; but their exhalations are prejudicial to the health of the inhabitants. The district is supplied with all the necessary salt from certain ports which it possesses, render it commercial and wealthy. The chief article of export is brandy: but the cod-fishery, and the colonial and coasting trade employ several vessels. The coast abounds in shell-fish, of species that are not very common; and the mussel-fishery (poissons des moules) brings in considerable profit. The salt is of three kinds, white, grey, and reddish; the first is the most esteemed.

The maps differ considerably in giving the boundaries of Aunis. Some contrast the province so far as to exclude the town of Rochefort, which is on the northern bank of the Charente; while others make the Charente the southern boundary of Aunis, and so include Rochefort. The map given in the Atlas to the Encyclopédie Méthodique extends the province still farther south to the Gironde; for the district of Brouage, which formerly appertained to Saintonge, was disembodied from that province and joined to Aunis, which thus included all the sea coast between Poitou and Guinane, together with the islands of Ré, Aix, and Oleron. The district of Brouage seems to be productive in salt, as also the isle of Oleron. The isle of Ré produces wine; but is ill-provided with wood, and is not fruitful in corn.

The chief town of Aunis was La Rochelle; and to this we may add Rochefort and Marennes as next in importance.

The province is now comprehended in the department of Charente Inférieure (Lower Charente). (Malte Brun; Encyclopédie Méthodique, 'Géographie Moderne,' article Aunis.)

AU RAN TIA CEE, or the orange tribe, are dicotyledonous polygamous plants, with dark-green jointed leaves, filled with fragrant essential oil collected in little transparent dots, and a superior ovary changing to a succulent berry, the rind of which is also filled with fragrant essential oil. No natural order can well be more strictly defined than the orange tribe, and none have properties more uniform and definite. It consists of trees or shrubs found exclusively in the temperate or tropical parts of the Old World, and unknown in a wild state in America; their flowers are usually odoriferous, and their fruit is usually some shade of yellow. They principally differ from each other in the number and proportion or arrangement of their stamens, in the number of cells or seeds in the fruit, and in the texture of the rind of the fruit, which does not always come off as in the oranges, but often leaves some adhering to the rind, forming a few tough, but frequently a mere skin inclosing the pulp. The natural order which is most nearly allied to the orange tribe is that called Xanthophyceae, into which the oranges pass by their climbing genus, Laronga, and which differ principally in having a hard dry fruit which splits into several carpels.
soldier; tall, handsome, and strong, skillful and diligent in all athletic and military exercises, temperate in his habits, and of acute intellect, he rose from his humble state to the highest military offices, during the reigns of Valerian and Claudius. It is a thrilling circumstance, but not unworthy of notice, as illustrative of the qualities which could be found in a general at that time, that the boys used to bring to the following odes in praise of his personal prowess:—

1. Mille, mille, mille, mille, mille, mille, decem milles; Utus homo mille, mille, mille, decem milles; Mille, mille, mille, mille, mille, mille, mille, mille.

These having habituated him to push before himself. He was distinguished by the soldiers from another Aurelian, also a tribune, by the characteristic epithet 'sword in hand' (manus ad ferrum). As an officer, his discipline was strict even to severity. He wrote to his lieutenant: "If you want me at the tribune, or to live, keep the soldiers in order. Let no one steal another man's bowl, nor touch his sheep. Let none plunder grapes, nor injure cornfields. Let none exact re, salt, or wood. Let each be content with his own rations. Let each get rich from the booty of the enemy, not from the tears of the provincials," &c.

On the death of Claudius, honourably distinguished by the appellation of Gothic, a.d. 270, Quintillus, brother of Claudius, assumed the purple, but resigned it by a violent death in the end of seventeen days, on hearing that the legions of the Danube had raised Aurelian to the imperial dignity. The new emperor suppressed an insurrection of the Suevi and Burgals, and compelled them to retreat to the northern side of the Danube; but he withdrew the Roman troops from the province of Dacia, and thus doubly strengthened the frontier of the empire by rendering the Danube its boundary, and by abandoning a district too distant to be easily defended, and too thinly peopled to defend itself. He engaged Aurelian was recalled to the north of Italy, by an invasion of a German tribe, the Alemani or Marcomanni. After various alternations of success, among which we may notice a battle near Placentia, in which the Roman troops were defeated and the right wing of the enemy was entirely cut off, a.d. 271. Aurelian then visited Rome, punished with a ferocious severity the authors of a sedition which had disturbed the city, and repaired the walls, including an additional space within their limits. The temples at Rome were owing to the "Monetarii, a body of men, explained by Poccius to be the coiners, a set numerous and united enough to raise seditions; to support which, he refers to the passage of Butropius (lib. i.). Aur. Victor also says that the "monetarii rebellarierunt; got up a rebellion. These monetarii were apparently the persons who managed the public coinage, which they had probably debased for the sake of their own profit. We know that Aurelian afterwards issued a new and improved coinage. See Gibbon (ch. xi. 494). He also puts a stop to the rebellion after the event, puts it after the defeat of the Alemani; Butropius and Aur. Victor do not fix any time.

Aurelian at this time was master only of the central portion of the Roman world. Under the weak and uncertain princes who preceded the energetic reigns of Carus and Aurelian, a multitude of contingents for empire started up, who fell one before another, or maintained, in these several districts, a short and anomalous independence. Of these, the last and most powerful were Tetricus and Zenobia, who respectively held the extreme west and east of the Roman empire. Spain, Gaul, and Britain owned, in name, the authority of Tetricus; but he was little more than a puppet of a monarch, in seeming possession of a power which he could exert in vain. Aurelian, however, did not rest content with his enemies, but resolved to relieve him from this splendid misery, and betray his own army into a defeat near Châlons, in Champagne, while himself, with a few friends, took refuge with his more fortunate competitor. Spain and Britain acknowledged the imperial power of Tacitus. Greatly distinguished by the year 271, contrary to most other historians, who make them subsequent to the fall of Zenobia. (See Vopseca, cap. 30.)

The west being secured, Aurelian beheld himself to that work which his numerous and victorious victories had rendered the object of his ambition; the reduction of the great, flourishing, and short-lived city of Palmyra. [See Palmyra, Odenathus, Zenobia.] Odenathus, who had raised his native city to this height of power, was dead, and succeeded by his widow, the celebrated Zenobia, a woman of the most resolute and masculine talents. The march of Aurelian was now extended as well to the east as to the west. In his route through Libya and Tunisia...
Aurélien was already returned to Europe, when he heard that the Palmyrenians had revolted, and massacred the small garrison of six hundred archers whom he had left in charge of their city. He returned in wrath, and exceeded even the emperor himself in severity on those who had offended. On his way to Persia, he drowned his troops in blood, and conducted his army in the inhospitable deserts which surround the oasis of Palmyra. Zenobia felt resistance to be hopeless, when Probus, to whom the re-conquest of Egypt had been entrusted, brought his victorious army to the assistance of the emperor; and she tried to escape, but was intercepted on her way to Persia, and brought to the Roman camp. The soldiers clamoured loudly for her death. Aurelian refused to shed female blood; but he took his revenge on the women themselves, who had incited their countrymen against him, by periwigging the celebrated Longinus, who had been Zenobia’s instructor in Greek literature. The city surrendered soon after the capture of its mistress, A.D. 273, and was treated with comparative clemency, being neither plundered nor destroyed.

Aurelian was recalled a third time to the East by a rebellion in Egypt, excited by Firmus, a merchant who had acquired immense wealth by commerce in India. This was immediately quelled, and Egypt restored to peace. He now cleared the Roman empire of all rivals and pretenders to independence, and restored it to its ancient limits, he returned to Rome, where he celebrated his various victories with a triumph of more than the usual magnificence. The details will be found in Vopiscus, chap. 33, &c.

After the ceremony the emperor visited Gaul and Illyricum; but his stay was short, for in a few months from the date of it we find him leading an army against Persia, to recover the country which he had surrendered. His march between Heraclea and Byzantium he was assassinated, in consequence of the treachery of one of his secretaries, named Mæstherus, whom he had threatened with punishment; and the emperor’s threats were known seldom to be without effect. Two of the chief officers of the army ostensibly devoted to death; and the restless character of Aurelian caused the fraud to be readily believed, and promptly acted on. The conspirators were those whose stations gave them a right to be near his person; he was murdered in October, 274 (in 273, according to some), after reigning from five and a half to six years, according to Vopiscus and Aur. Victor. Gibbon, without quoting his authority, makes it four years and nine months. He left a single daughter, whose descendants remained at Rome when Vopiscus wrote.

Aurelian is ill-described by Eutropius as of a character necessary on some occasions rather than lovable on any; but harsh on all. Yet he had many qualities noble and valuable in a ruler: he was frugal in his expenses, temperate in his pleasures, moderate in providing for friends and adherents, strict in preserving good order, and resolute in repressing peculation, and punishing those who grew rich on peculation and the spoils of the provinces. But these good qualities were obscured by a temper naturally harsh, and trained by a long and exclusive course of military service into total carelessness for the sufferings of others; insomuch, that the Emperor Diocletian, himself not over inclined to compassion, said on that account that Aurelian was better suited to command an army than an empire. (Vopiscus, in the Historia Augusta; Eutropius; Aur. Victor; Gibbon, c. xii; Crevier, Histoire des Empereurs Romains, vol. vi.)

Vopiscus informs us (cap. i.) that his Life of Aurelian was founded on Greek authorities (there having been no Latin history of Aurelian before his), and on the Journals and Campaigns of the emperor, which were then kept in the Ulpin Library at Rome.

AURELIUS, MARCUS; or, as he is called on his medals and elsewhere, Marcus Antoninus, was the son of Annius Verus and Domitia Calvina. Verus traced his pedigree to Numa, and Domitia her to Malennius, a Salentine prince; the fathers of both were consuls. Aurelius was born on the 15th of April, A.D. 121, and was named Antoninus Verus. Hadrian, with whom he was a favourite from infancy, familiarly called him Verantius, a distinction which he even then merited. To his natural disposition, habits, and early accomplishments, which it is honourable to the emperor to have perceived and cherished, he owed his adoption into the Aurelian family by Antoninus Pius, who was himself adopted by Hadrian, upon condition that he should adopt Antonius Verus, and the son of a deceased favourite, L. Cneonius Commodus (called, after his adoption by Hadrian, Allius Verus Caesar), who was to have been his successor; this son was named Lucius Verus. [See VERUS.] There was policy, as well as family connexion, in these proceedings. The father of Aurelius dying while he was young, his grandfather took charge of his education, and gave him every advantage which the age he lived in could afford. We learn from himself that he had masters in every science and polite art, whose names and qualifications he has most gratefully recorded, modestly attributing all his acquirements to their instruction and example. (See Book I. of the Meditations.) They were all more or less remarkable for rigid observance of the rules of morality, command of temper, polite conversation, and courteous manners, and were all afterwards rewarded according to their merits and just expectations, two of them being raised to the consulate. These men, therefore, were not only tutors, but models upon which the more perfect character of Aurelius was formed; the foundation of which, however, he piously says was laid by his parents. From what he had heard of his father, he learned modesty and manly firmness; from his mother, piety, generosity, and simplicity of life; from his grandfather, virtuous disposition of mind, and
habitual command of temper. &c. For the art of government, and the manners that give dignity to a ruler, he afterwards studied the public and private conduct of Antonius Pius. Most of the best teachers on these sciences. One of the most distinguished of them, Rusticus, procured him a copy of the works of Epictetus, which confirmed his natural inclination to Stoicism, and became his insepzable companion; he delighted in commenting upon them, and thanked the gods for the grace, the man, and the management with which they had collect wherewith to conduct his life with honour to himself and advantage to his country. The life and writings of the emperor rank him, indeed, amongst the best teachers and brightest ornaments of the stoical school, and have led his life to be judged upon its merits. It would be out of place here to do more than to acknowledge the general excellence of its moral rules, and their universal application as a system of moral philosophy to the use of men of all ranks and conditions in society. From this circumstance, Stoicism had more followers than any other philosophical sect. Much has been said of its extreme severity: perhaps from some of its followers having overstrained its rules, and adopted practices more rigid than are consistent with nature and conformable to reason; but such men are sectaries, and not Stoics. But, admitting its rules to be laid down in an extreme manner, they stand upon the same footing as certain theories in the exact sciences that find their natural limits in practice: the lives of Epictetus and Aurelius, the just limits of the rules of Stoicism, and the proof of their utility to men of all conditions in life, may be found. They were equally adapted to the purposes of these two men, who may be called the extreme links of the social chain. One was a man free from every sin, but that of his own vices by Nero, living in the worst of times, with the worst examples immediately before his eyes, and trusting to chance and his own exertions for education. The other was not only a freeman, but born to command, and enjoying every advantage; yet there is nothing in the lives and practices of these two men contrary to nature and social order, and little or nothing more to be required of either of them than what they performed. They were equally remarkable for their sagacity and generosity, and did it to every respect; and they have each left us the rules by which they governed themselves. [See ARRIAN, and EPICETUS.] The work of Aurelius, which is divided into twelve books, and written in Greek, is generally known by the name of his Meditations. There has been much unnecessary cavilling about its Greek title, τῶν ἡγεσίων, variously rendered 'of and to himself;' or 'concerning himself.' It is a private note-book, kept for a purpose that the critics would have been best pleased to learn out. Aurelius accomplished the arduous task of passing through a life of extraordinary difficulty and temptation with unblemished character. His son entirely failed in it, not from disability, for he was educated as his father, and showed every inclination to walk in his steps, till he became a feeble, tormented, but observant, and controver; till then he must have given satisfaction, for his father thanks the gods that he had found proper tutors for his children. We must therefore infer that education and natural inclination are not of themselves sufficient to keep a man in the paths of virtue without an unmitting discipline. The severest and most important rule of Stoicism relates to self-government, and enjoins daily and hourly examination of all our thoughts, words, and actions. The point of this neglected it, as his book proves; it was his monitor to keep him to his duty; it fully illustrates the efficacy of stoical discipline, and its effect upon the man himself gives it its power. As Aurelius, it enforces the observation: in his education, and a collection of rules, dogmas, theorems, comments, and opinions, put down as they were suggested by passing events, reading, or conversation; sometimes they appear to be preparations for particular cases in which he expected he shall be called upon to act or suffer. They were no regular series, nor have they any relative order, but they all tend to the purposes of morals, discipline, and self-government. When not new, they are placed in a new light. They may be considered as a supplement to Epictetus, and the two together form the best code of moral discipline left to us by the ancient philosophers. This book was first edited in Greek and Latin by Xylander, Zirrelz, 1554, then by M. Casaubon in 1643, much improved; but still more by Gazanfer, Camb., 1652, with some valuable tables of reference. It was re-edited by G. Stanhope, with Dacier's life, London, 1697, 1704. An edition by J. M. Schulz was published at Schleswig, 1802; and another by Coray, Paris, 1816. The English translations are by M. Casaubon—seven editions between 1634 and 1702; the reader is con- fused by his explanations of his own language as he goes on: by J. Collier, remarkable for its vulgarity; by J. Thomson, 1747. Anon., Glasgow, 1749, harshly literal; and by R. Graves, 1792, said to be the best, but very bad. The events of Aurelius's life are marked by wise and prudent conduct. He passed through all the offices usually given to persons of his rank and pretensions, and as he most punctually attended to his duty in them, he obtained those facilities as a man of business for which he was remarkable. In his fifteenth year the daughter of Cn. Commodus was betrothed to him by the desire of Hadrian, but the union was dissolved by Antonius Pius after Hadrian's death. His adoption by Antoninus Pius took place in his eighteenth year, when he was named Marcus Aurelius Aurelius. After the death of Hadrian he married his cousin Faustina, daughter of Antoninus Pius, a lady whose conduct was not calculated to promote his happiness, and though he had ample cause, he refused to divorce her. Upon the death of his new father in 181, he took the name of Antoninus, and immediately associated Lucius Verus with himself as partner in the empire; he also gave him his daughter Lucilla in marriage. This last and highest office Aurelius accepted at the request of the senate, much against his inclination; but having accepted it, he never suffered his fondness for study and philosophy to interfere with his public duty. A troublesome reign ensued, beginning with inundations, earthquakes, famine, and pestilence, causing universal distress, which it required extraordinary exertion to alleviate. The life of a man, whose object was peace was almost entirely occupied by war, owing to former emperors having conquered more countries than they could unite in one empire. This was only making as many enemies, open and concealed, as conquerors. The safety of the empire, however, now depended upon its keeping all its provinces, for if its inability to do so could be proved, common cause would be made against it, and its destruction would follow. Hence it became the duty of Aurelius to put down the insurrections that broke out in all quarters. This he did by activity, fortitude, and a prudent choice of his lieutenants: he was everywhere victorious; and he took the best means in his power to make his victories effective, by showing mercy and clemency to the conquered, endeavouring there-
The calamities in Italy were not ended when the Parthian war broke out. Verus took the command in this war, and returned victorious, a.D. 166, but brought the plague with him to Rome. (See Verus.) Calpurnius Agricola was sent against the Britons, who threatened invasion; and Aurelius Victorinus against the Catti. The two emperors soon after marched together against the Marcomanni, and obliged them to sue for peace. In returning from this expedition Verus died, a.c. 169. In the year 174 Aurelius was com- pelled to come to the relief of his more successful succes- sors. During this campaign a battle was fought with the Iazyges on the frozen Danube: and in the year 174 an event happened which has given rise to much contro- versy, though we are not quite sure of the cause of it. It is said that Aurelius, being unwarily drawn into a defile by the Quadi, was nearly overcome by the attacks of the enemy, whom, from the nature of the place, the Romans could not resist, as well as from fatigue, the usual evil of autumnal campaigns. The victory was so great, however, which they had not tasted for some days. From this difficulty they were suddenly relieved by a violent storm, that fell lightly on them, and gave them an opportunity of refreshing themselves, while it directed its fury against the enemy, showing them, as some say, the lightning, to which others add wildfire, actually destroyed towns. The Romans took advantage of the storm, and gained a victory. Upon this, some unlucky legends, not knowing that the 12th or Thundering Legion was on the banks of the Danube, in such a manner that it happened, took occasion to call it a Christian Legion, and to attribute the miraculous storm to the efficacy of its prayers: and a letter exists from the emperor to the senate acknowledging the fact. This letter is in Greek: no Latin copy has been preserved, but the authenticity can be asserted, and nobody will believe that Aurelius would insult the senate by writing to them in a foreign language, though it may be argued, as it has been, that this is only the substance of the emperor's acknowledgment, and is not substantially the same. (See the letter in Dacier's Life of Aurelius, Stanhope's ed.) But the internal evidence of the letter is perhaps sufficient to destroy its credit. The heathens are also said to have acknowledged the miracle, and to have attributed it between two of their deities, that of Phoebus and the god of grace. (See Episc. Hist. Eccles. iv. 13.) Some attribute it to Antonius Pius; but the charge of persecution is still maintained against Aurelius, especially in the last part of his reign, which I believe to be groundless, to reconcile this with his known character and writings. Censorinus (iv. p. 453) calls him the author of the fourth persecution against the Christians; for the emperor herein declares that they are not for the future to be tolerated for their religious opinions. There is also another letter, said to be written by Aurelius to the council of Asia assembled at Ephesus, upon the subject of the Christians. They are accused in it as far as it proceeds persecution, and confines punishment to civil crimes, and not to opinions. (See Euseb. Hist. Eccles. iv 13.) Some attribute it to Antonius Pius; but the charge of persecution is still maintained against Aurelius, especially in the last part of his reign, which I believe to be groundless, to reconcile this with his known character and writings.

Censorinus (iv. p. 453) calls him the author of the fourth persecution against the Christians; for the emperor herein declares that they are not for the future to be tolerated for their religious opinions. There is also another letter, said to be written by Aurelius to the council of Asia assembled at Ephesus, upon the subject of the Christians. They are accused in it as far as it proceeds persecution, and confines punishment to civil crimes, and not to opinions. (See Euseb. Hist. Eccles. iv. 13.) Some attribute it to Antonius Pius; but the charge of persecution is still maintained against Aurelius, especially in the last part of his reign, which I believe to be groundless, to reconcile this with his known character and writings.

During his long northern campaigns Aurelius crossed the Danube many times, and Sarissibarbus, with his victories, are commemorated on one of the medals which we have given. But the rebellion of Aquitania Cæsaris in the east compelled the Emperor to return to Rome, and to leave the barbarians of the north in a more powerful position than was con- ceived possible at the time of the former peace.

The clemency, justice, and sound policy of the Emperor were particularly shown in this rebellion of Cæsaris (a.d. 173), who, after a feeble and unsuccessful attempt to get pos- session of the empire, was put to death by his own officers. He would not extend the usual penalties to his family, nor suffer many of his accomplices to be punished; he even destroyed his private correspondence, that none might live in fear, and he induced to continue in rebellion as their only safety. He left the whole matter to the senate, as if it had been an ordinary affair, recommending the greatest clemency, as he was most desirous of sparing himself from all imputation of revengeful feeling. (See Cæsaris, Avidius.)

After the death of Cæsaris, the Emperor made a journey into the east in order to restore tranquillity, which had been somewhat interrupted by the last rebelion. In his visit to Lower Egypt and Syria, he consoled the good- will and affection of his various subjects by his kindness and his affable manners. During his return through Asia Minor, his wife Faustina, who accompanied him, died at a place called Halis, at the time of Mount Faunus, which had long been devoted to the worship of Diana. Aurelius also accorded several honours with the title of Diva. Aurelius also in- stituted a new establishment for young ladies under the title of Novus Paeuli Faustinianae, in imitation of that which was created by Antoninus Pius for the daughters of the mother of the emperor. (See Antoninus.)

We should not omit to mention, in opposition to the accounts of Capitolinus and Dion Cassius, that the emperor extols the obedience, affection, and simplicity of his wife. (Med. i. 17.)

Smyrna, with the Bithynian plain, was celebrated for the rhetorical talents of Aristeides, who pronounced on that oc- casion his declaration in praise of Smyrna, which still exists among his works. Two years afterwards, when Smyrna was ruined by an earthquake, Aristeides prevailed with the emperor to have its streets inhabited by the same bounty that he had already bestowed on other cities. (See Aristeides, Alcius.)

From Smyrna Aurelius passed to Athens, where he appears to have been admitted into the sacred mysteries of Cheiron. During his stay there, his high pre- eminent seat of learning by foundling chairs of philosophy for the four chief sects, the Platonists, Stoics, Peripatetics, and Epicureans; and also a professorship of rhetoric.

The close of his life is described in his book spent in the peaceful retirement which he loved, but in the midst of a northern campaign against the Marcomanni, Hermurundii, Sarmatians, and Quadi. His son Commodus accompanied him during these campaigns, which appear to have lasted two years, and lost two of their children. (See Cæs. cap. 42.) The Antonine column at Rome commemorates the miraculous shower in the historical sculptures on its shaft. (See Antonine Column.)

This letter to the Senate, if genuine, would prove that some of the emperors had been at Iesus, or that the Christians; for the emperor herein declares that they are not for the future to be tolerated for their religious opinions. There is also another letter, said to be written by Aurelius to the council of Asia assembled at Ephesus, upon the subject of the Christians. They are accused in it as far as it proceeds persecution, and confines punishment to civil crimes, and not to opinions. (See Euseb. Hist. Eccles. iv. 13.) Some attribute it to Antonius Pius; but the charge of persecution is still maintained against Aurelius, especially in the last part of his reign, which I believe to be groundless, to reconcile this with his known character and writings. Censorinus (iv. p. 453) calls him the author of the fourth persecution against the Christians; for the emperor herein declares that they are not for the future to be tolerated for their religious opinions. There is also another letter, said to be written by Aurelius to the council of Asia assembled at Ephesus, upon the subject of the Christians. They are accused in it as far as it proceeds persecution, and confines punishment to civil crimes, and not to opinions. (See Euseb. Hist. Eccles. iv. 13.) Some attribute it to Antonius Pius; but the charge of persecution is still maintained against Aurelius, especially in the last part of his reign, which I believe to be groundless, to reconcile this with his known character and writings. Censorinus (iv. p. 453) calls him the author of the fourth persecution against the Christians; for the emperor herein declares that they are not for the future to be tolerated for their religious opinions.

Aurelius Victor. Four books are commonly published together under the name of Aurelius Victor. "Origo Gentis Romanorum," an imperious work, beginning with Janus and Saturn, and going down to the foundation of Rome. 2. "De Viris Illustribus Urbis Romae," which contains short biographies of the most illustrious Romans, with a few foreigners, from Romulus down to Pompey. 3. "De Caesaribus," to the death of Tiberius. 4. Augustus to the appointment of Julian to govern Gaul, a.d. 356. 4. "De Vita et Mortibus Imperatorum Romanorum," or Aurelii Victoris Epitome, another history of the emperors, from Augustus to the death of Theodosius the Great, a.d. 395.

That all these are not written by the same person is generally acknowledged; by whom they are written it is harder to say. It is pretty well agreed that the 'Origo Gentis Romanorum,' is not written by the same person as the 'Illustrious Men,' or the 'Caesars;' and some of the recent critics, who have attributed it to Asconius the critic. The 'Illustrious Men' has been variously ascribed to Cornelius Nepos, Pliny the Younger, Suetonius, and the true Aurelius Victor, who is the undoubted author of the 'Caesars.' Of his life we hardly say anything: he tells us that he was born in the country, of a poor and unlearned
father,' and it is conjectured, from his abundant praises of Alba, that he was a native of that province. The 'Cassars' seems, on the evidence of a passage written in the present tense, to have been composed about the year 359; and there are other grounds for supposing that Victor was alive at that time. It is said in Ammianus Marcellinus (xxxii.) that the Emperor Julian 'appointed Victor the historian prefect of Pannonia Secundaria, and honoured him with a brassen statue, and that some time after he was made prefect of the city. Now there is an inscription extant, from which we learn that Aurelius Victor was prefect of the city in the reign of Theodosius; and it is probable that these two notices refer to the same person. We also know that Aurelius Victor was consul with Valentinian, A.D. 369. This brings us to consider who was the author of the 'Epitome,' which extends to the death of Theodosius. In all the titles prefixed to the MSS., it is mentioned as 'Epitome ex libris.' brevissimis ex libris.' Socit. Auct. Victores; and Mad. Dacier thinks that it is really an epitome, taken partly from other sources than the 'Cassars' of Victor, which she believes to have come to us imperfect, and to have extended to the reign of Theodosius. This opinion is counteracted by those being no formal conclusion to the work as it now stands. Nor is it impossible, nor indeed improbable, supposing Victor to have lived in middle life between the years 359 and 369, that he may have lived and continued his work down to the end of Theodosius's reign in 392, when the Epitome ends.

Neither the style nor the contents of these books entitle the author to a high place among historians. The most important portion is that which contains the history of the empire down to the reign of Constantine, and those of Schott, Guener, Arnstinen, i.e. The most modern which we have seen noticed is that of Schönböger, Vienna, 1720. Valpy's Delphin edition (vol. i.) contains a collection of notices from various writers concerning the life of Victor, and the authorship of the works bearing his name. See also Moller, 'Dissertatio de Aurelio Victore,' Altdorf. 1805.

AU REUS, or DENARIUS AUREUS, the ordinary Roman coin of gold, was equivalent to twenty-five sestertii. Only a few exist.

Gold was first struck at Rome in the year of the city 447, or 297, before Christ, in the consulship of C. U. Nero and M. Liv. Sebastiani, sixty-two years after the introduction of the coinage of silver. The earliest coin of gold at this time was named a scripulum (scripulum), and went for twenty sestertii.

### Scrupulum

A scripulum was of that age. (See Pliny. Nat. Hist. lib. xxxiii. c. 5.) edit. Daldampus, et Variorum. In other editions, c. 13.) It had the head of Mars on one side, and an eagle standing on a thunderbolt upon the other, with the word 'roma' below; and was marked xx on the back of the head of Mars. Raper (Imprima into the Value of ancient Greek and Roman Money. Philos. Transact. Ist. p. 304.) determines the weight of the scripulum to have been 171 Troy grains, which is the weight of one in perfect condition in the British Museum. Nauseus, as quoted by Eckhel, ('Dctor. Num. Vt. tom. civ. c. 4.) makes the true weight twenty-one grains and one-third. These, as

### A Triple Scrupulum

It appears, are Paris grains (see Eckhel, v. 41); 171 Troy grains being equivalent to 214 Paris grains. Its double was marked xxx, or forty sestertii; and its triple xxx, or sixty, which weighed 52 grains. The symbol which precedes the x on this triple scripulum, indicates L or 50:

Eckhel shows, that on the denarius of Tib. Claudius, and in other cases, the Romans represented 50 by a symbol very like an inverted T.

Pliny proceeds to say that it was afterwards usual to coin forty pieces out of the pound of gold (larger in size, of course, bearing the general name of Aurei), and that the Roman emperors by degrees fixed them forty-five to the pound. In a passage, the corruptness of which is more than suspected, some of the texts ascribe this last change to Nero. Alexander Severus coined pieces of one-half and one-third of the aureus, called Semis and Trigintis. E. L. Longinus, in 'Africa, Sertorius Vat. cap. 39,' whence the aureus came to be called solidus or solidus aureus, as being the integer.

Soon after the reign of this prince the coinage became very irregular, till Constantine entirely new-modelled it by coming aurei of seventy-two to the pound of gold (see the Codex Theol. de Ponderatoribus, § i. Cod. Justin. 1. 13. 70. de Susceptoribus § 5.) a more convenient number than either or forty-five, as it divided the ounce and half ounce without a fraction.

Eckhel from Nauseus (Dctor. Num. Vt. tom. c. 4.) states the variations of weight of the aureus between the year 317-5 of Rome and Caracalla's time into eight epochs, varying in the respective coins from 133 to 125 (Paris) grains. That the estimates are correct may be gathered from the following facts. Inscriptions, of gold denarius, are in a state of high preservation in the British Museum. An aureus of Julius Cesar weighed 123 grains, which is exactly the weight of an English sovereign. Out of twenty-five gold denaries of Augustus, one weighed 115 grains, five weighed 124 grains each; one 125, one 127, and one 129. Of fifteen aurei of Nero, four weighed 111 grains, two 114, two 116, two 118, one 119, one 120. An aureus of Maximianus I. weighed 81 grains, Carac- sius 67, and Maxentius 79. The coin of Carausus, of which a copy is here given, is believed to be unique. (Rev. Mr.

Cracherode, who bequeathed it to the British Museum, bought it at the price of 120. Of the aurei of Constantine in the Museum, there are 66 grains, three 67, three 69, one 73, and one 81. The highest weight is possible in coins struck before Constantine's re-arrangement of the coinage. All here mentioned, as far as can be ascertained, are of gold without alloy.

The average weight of the aurei of Augustus, then, appears to have been nearly 121 grains, that of Nero's aurei nearly 117.

Raper says the Consular aurei weighed at a mark 126 grains. Some of the Family aurei in the Museum weigh 124, 124, and 125 grains.

The following is Lemorne's table of the mean weight of Aurei, transferred into Troy grains:

(See Lemorne, Considérations générales sur l'Étude des monnaies grecques et romaines, &c. Paris, 1817 at.)

Victors in the ancient races were usually rewarded with aurei. (See Sueviton, Claud. cap. 21 § 10. Justin, nat. v. 24.) The scholar observes that no more than five were allowed to be given in such cases. (Buleng. de Roma.)

The few (probably the maximum) to a lawyer was called a cursum aurei, due Lucian, (D. 1. 12. de or. 2. 4.) A single aureus was all that Justitian permitted to be reckoned at due. (Cest. Capit. de Theorum Trau. et Code. Ludi, op. Græ. Theorum tom. viii. col. 1272.)

The reader who wishes for information upon the aureus.
beyond what is here given, may consult Plinicus, Lexicon t. 210 on return. Elda, D. N., P. 84. vol. 17; P.;—
Pinnez, 

Eaton on Medals, vol. 1, p. 144; and Raper's Inquiry, already referred to.

AURICH, at present a landrostee, or province, of Hanover,
formed, in ancient times, the eastern part of the land of
the Frisians. It is separated from the Zuider Zee, or the
Intracoastal Channel, by a series of banks, the southern
most bank being called the Zuider Zee. The Frisians are
the most northerly point of Germany, and is
bounded on the west by the kingdom of Holland
and the bay of the North Sea, into which the Ems discharges
itself, on the north by the North Sea; on the east by
the Zuider Zee; and on the south by the land of
the territory of Meppen. The whole surface of the province
is a flat, that the Plottenberg, the highest land,
do not exceed sixty feet in elevation above the sea.
The districts adjacent to the North Sea, which washes nearly
three miles from the Zuider Zee, are the most fertile marsh-land in
by the Hanoverian dominions. They are separated from
the interior of the province, which is a series of moors
and heaths, by a tract of sand between two and three miles
in breadth; on the sea side, they are protected against the
winds of Aurich. The provincial domain is six hundred
and nearly one hundred miles in length. The larger vil-
lages in this marsh-land are built upon mounds, thrown
up by the natives; they are clean and airy, but destitute of
trees or other natural shelter. The tenements in the more
hospitable districts are generally surrounded by garden-

Aurich is estimated at 1134 English

inches; on the opposite

side the inhabitants has
converted 351,202 Frisian dinner platinum, out of 325,204, into cul-
tivable land, 49,000 more are barren heath, 7,830 remaining
in the remainder of the province, for the cultivation of
food. The whole extent of woodland is not more than 6800 morgen;
about 3330 acres. The Ems traverses the province in the
south, and in the middle of its course receives the Leda,
whose waters have been increased by the Jumme. The
coast is fringed by banks of sand, varying from four to nine
miles in breadth, and covered by the tide at high-water;
their outer margin is cloistered with a chain of islands, which
are nothing more than masses of sand thinly coated with
grass, and shaded by heath. The northern shores of the
stretch of water is exposed in high winds to the
winds of the ocean. Nordernach, the central island in the chain, is
partially visited in the summer months for the purpose of sea-bathing.
These islands occupy about sixteen square miles of the whole
province, and contain five towns, among which are Emden,
Leer, and Norder; 145 parishes; and, as appears by the
census of 1653, 152,408 inhabitants, who, with the excep-
tion of four congregations of Roman Catholics, and as many
or more Protestants, are for the most part engaged in
considerable grows of grain, particularly oats and rapsaped;
bread great numbers of horses, sheep, and cattle; make
much honey; and are actively engaged in foreign
commerce and the herring-fishery on the North Sea.
Their export of fish amounted in 1568, to
value of 31,187 shillings, its gross proceeds sold is computed at
7,666,311 dollars, or about 1,054,140 per annum.

There are no people in Europe who showed greater jen-

from their independence in past times, and displayed
tolerable courage in asserting it, than the East Frisians.
Their Chieftains were elected by the free citizens of the
their empire, pre-eminently, the emperor's free subjects;
and they were every way deserving of this title until they
sobered their leaders to surrender their liberties into the
irresponsible hands of the Polish monarch of the fifteenth
century. From this period, until the year 1626, that family
ruled over it as counts, and subsequently to the latter date,
as princes of the empire. The Zirkensgas having
existed in 1744, East Frisian was taken possession of
by Prussia in the year 1766, and the principal town from the
Prussian dominions and annexed it to Holland.
Six years afterwards Prussia, having re-established its
right to it, ceded it to the king of Hanover, who incorporated
it with his states under the name of the Landrostee of Aurich.

AURICH, the capital of the province, as well as of one
of the twelve circles into which the province is divided, is
an open town, situated on the easternmost coast of
which unites it with Emden, from which it is about fifteen miles
distant in a north-easterly direction. It is really built in
the Dutch style, and is embellished with a handsome
palace, the residence of the former princes of East Frisia,
who took up their abode there in 1626. It is, or was, the seat of
the provincial government of the province. It is the seat of justice
and place of judicial record for the province, as well as of
the Protestant Consistory, and once possessed a mint, the
coin struck in which was stamped with the letter D. There
are a great many places of worship, three churches, a high school
or gymnasium recently erected, a poor and orphan house,
four public libraries, and a seminary for the education of
middleclass, in the town. It contains nearly 500 houses, and
between 3200 and 3100 inhabitants, who depend upon internal
traffic, particularly in horses, and a little trade in
brandy, leather, tobacco, tobacco-pipes, and paper,
for their chief subsistence. The canal, of which we have spoken,
is forty feet broad, has three sluices, and is crossed by nine
bridges. Aurich lies in 53° 25' N. lat., and 7° 20' E. long.;
its area is 190 square miles, or 50,342 acres. The
neighbouring village of Rabe is the site of the celebrated
Upstalsboom, or national assembly, which the Frislanders
held in former days.

AURICULA, in horticulture, a kind of primrose, found
with abundant place in the Swiss Alps, where its flowers
are usually of a clear bright yellow; they are sometimes white,
but this is unusual. It has for centuries been an object of
cultivation by florists, who have succeeded in raising from
seed a great number of varieties having but little resem-
lance to the wild flower. The flower is white, or purple or
there is substituted a centre of deep purple or brown,
surrounded by a broad edge of a white, grey, or green powdery
matter, or the whole corolla is of some uniform colour, such
as purple, deep violet, or blue-green; the latter is tech-
nically called sulfa, and although more beautiful than the
powdered kinds, are less esteemed by florists.

In these plants the great object of the grower is to obtain
large clusters, or clusters, of flowers, and clear, well-defined
petals; and the flowers, when fully open, should be
scarlet or yellow. Auriculae are particularly esteemed for
collage in these respects. All the kinds have been pro-
duced by sowing seeds, but there is no flower which produces
more seldom a new variety of merit; and it often happens
that out of some thousand seedlings not one is sufficiently
meritorious to be worth preserving.

Many books have been filled with directions for the
management of the auriculae, and these directions have been
so fully given, that one hardly knows which to admire the
most, the laboriousness of the writers, or the patience of their
readers. As the forms of auriculae are so various, it is not
possible a regular classification of auriculae may be reduced to a
few fundamental principles, the application of which may be safely left to
the good sense of the grower.

The first consideration is under what circumstances the
auricula grows best. It is most at home in the mountains of
all the south and middle of Europe, especially on those of
Switzerland. In those places it might be supposed that it
experiences intense cold in winter; but this is probably not
the fact, for it is covered early in the winter with a thick
coat of snow, under which it continues to flourish; the soil
is then so protected from the severe cold, and screened from the
stimulating effect of light. When the snow melts, it
begins to feel the excitement of brilliant light, and to
unfold beneath a pure and equable atmosphere, perpetually
watered by the pluvial showers of the alpine climate.

The auriculae or auriculae do not resemble the vegetable mould which is kept continually damp by
the melting snow, but never becomes wet, on account of the
steepness of the situations in which the plant delights
to dwell. Under the same circumstances they flower and
perfect their seeds; the drier weather of summer, however,
they cease to grow with vigour, and in the autumn have
reached a state of complete torpidity; they never, however,
become absolutely dry, because of the rains and
storms which the auricula is necessarily exposed to in the
Alpine climate. To sum it up, in the auricula, all the
natural conditions of growth are supplied by gentle warming;
they are left entirely exposed to light and air all day long,
except in cold or stormy weather; and they are supplied with
more and more water as their leaves become large enough to consume it. The pots in which they are planted are half filled with fragments of pottery in order to ensure the free aeration of the roots, and are covered with a layer of gravel which is removed every year. At last, in April, the flowers are about to expand; that period has arrived towards which the anxious hopes of the cultivator have been so long directed; the leaves are fully formed, and are ready to nourish the flowers; the blossoms that have been sprouted in the autumn, by means of a shower of rain or a storm of wind would deface the delicate surface, and tarnish the soft velvety colours in which the beauty of the auricula consists. Greater precautions than ever are now taken for a full and perfect blooming; it is never removed from the table when it is not only elevated at the back to admit the free air, and screened by mats or awnings from the direct rays of the sun. At last the development is completed; the corolla displays its rich surface, and all that care and skill can accomplish has been effected; to remain, however, in a frame but imperfectly ventilated and constantly shaded, would soon destroy the freshness of the colours, produce a general relaxation of the parts, and the blossoms would quickly perish. As soon therefore as the flowers begin to open, the pots are taken from the frame, are placed on slates or boards on the north side of a wall or hedge, and are screened by hand-glasses propped up by pieces of brick or wood so as to admit a free circulation of air, and provide against injury from rain or sun.

When the flowering is past, the auricula has fulfilled its annual function; and even if seeds are required, no further care will be necessary than to place the plants in a northern aspect, in a spot where they are not exposed to constant wet, and where the soil without becoming dry, remains moist enough for the reproductive rocks amply provided for; many persons keep the pots continually on a stage or on tiles, so as to prevent their attracting too much damp from the soil. At last the auricula will sink to rest; seeds will be ripened, its leaves will turn to yellow, and it will flower the succeeding year, and the powers of life will be exhausted; but a winter's rest will enable it in the succeeding year to recommence its annual course with renovated strength.

The main points in the cultivation of it, with reference more particularly to the high-bred varieties, are, moisture, drainage, protection from cold, and full exposure to light and air; if these are properly attended to, no auricula plant can be unhealthy, or fail to flower well; for the leaves will be enabled to execute all their vital functions fully and regularly, and this will ensure the well-being of all the other parts.

But the florist will not remain satisfied with keeping his plants merely in health; he requires a vigour altogether proportionate to the beauty of the flowers, and that would have a curious effect when nature unassisted forms but ten; as many as 127 have been obtained in a single cluster. For this purpose rich and stimulating manures are applied; and the most disgustingly refuse of the animal world has been rammed for manure through which many auriculas may be seen to grow. The whole theory of manuring is at present so ill-understood, that it is difficult to say what material is best suited for the purpose; all that we really know, is that manure acts simply by forming carbo acidi, which is the food of plants; and one would suppose, that whatever forms carbo acidi and most readily and constantly would be the most efficient manure. This no doubt explains the cause of the different opinions that are held concerning the best manure for the auricula. One person recommends blood; a second, guano; a third, stable midden; and a fifth mixes all these together: the only thing the growers agreed upon is, that the manure, whatever it be, should be thoroughly incorporated with loam and light vegetable manure, and be supplied at the beginning of the season. The latest writers on the subject recommend the following compost:—

1. One barrow of rich yellow loam, or fresh dug earth from some meadow, or pasture, or common, with the turf well rotten; one barrow of leaf mould; one barrow of well rotted cow manure; one barrel of strong farm dung, two years old at least; and one cart of river sand, not sea sand. (Hooff's Supplement to a Treatise on Flowers, p. 166.)

Besides this, it is found advisable to apply a small quantity of liquid manure three or four times during the growing season. Water in which sheep and horse dung is dissolved is usually employed for this purpose. It would be worth trying the effect of putrid yeast, which is the most active stimulant of vegetation that has yet been discovered; but if this material is used, it should be diluted with water till it acquires the colour and fluidity of small beer.

By means of agents, such as have just been described, an extraordinary vigour is given to the plant, which is infused into the auricula, and splendid flowers are the result; but it is said that such plants are short-lived, and that they rarely recover the effects of the excessive excitement to which they have been subjected. The propagation of the auricula takes place by its lateral offsets, which are produced more or less abundantly according to the healthiness of the individual or of the variety. In the spring, when the plants begin to grow, these offsets will be readily separated from the parent plant, but it is not in their greatest activity; it is at that period, therefore, that the propagation of the auricula should take place; the offsets should be carefully cut from the mother plant, potted in light rich earth, and placed under a hand-glass until they have established themselves; as soon as that has taken place, the hand-glasses should be lifted up and air freely admitted to the young plants, which will, however, still require to be shaded and kept slightly moist, for reasons which the reader will find explained under the article Hand-glass.

All plants cultivated in pots are placed in a most unfavourable condition for growing vigorously and remaining in a healthy state; they not only exhaust the soil, but deplete it of oxygen, and their escape from rain and sun is frequently none without means of seeking fresh food, or of avoiding that which is pernicious to them. [See POTTING.] The only remedy for these evils is to free the roots once a year from all the soil in which they have grown, and to repot them in rich manured soil. This operation should be performed at the same time and in the same manner as is recommended for offsets.

New varieties of the auricula are procured exclusively by sowing the seed; and if this were judiciously saved, a large proportion of all dour would possess sufficient beauty to deserve preservation. In the words of one of the most successful of its cultivators, the auricula is to be bred as high as a race-horse, by a corresponding attention to pedigrees; so little attention is however paid to the true principles of selection that many of the best Auriculas are grown from good variety from some thousand seedlings. What a grower who would breed auriculas, or any other flowers, should bear in mind, are these maxim—

1. All plants that have been obtained by artificial means, have a tendency to return to that wild state from which they have been reclaimed.

2. This tendency is particularly strong when they are raised from seeds, and will be in great proportion to the distance of the parent plant from the most highly-cultivated state.

3. But the tendency may be counteracted by continually selecting the finest and most highly-bred flowers to yield seeds.

The latter are, however, open to the influence of other and inferior varieties, provided they are placed near them at the flowering season.

5. Especially rare should therefore be taken, not only to select for yielding seed the most beautiful flowers of the most perfect varieties, but also to prevent the possibility of wind or insects conveying among them the pollen of inferior specimens.

The seed should not be known as soon as it ripens, but should be kept in the seed-vessel till the succeeding summer, or, in the month of May or June, when they may be sown in a close mould in earthen pans in a box bed frame, and subsequently treated like other seeds of a similar nature.

The marks of a good auricula are, in the opinion of many florists, those that should consist of four principal parts. Namely, the tube, the eye, the ground colour, and the border. The tube should form one-sixth of the whole diameter; the eye, including the tube, one half; and the ground colour, with its border, the other half. The margin of the tube should be about the same width as the tube; the more perfect it is to be esteemed, and the more the flower, that is to say, such as have the lobes of the flower very distinct, being the worst. The mouth of the tube should be well filled by the anthers; the eye should be a little sunk below the mouth of the tube, and of a clear even white; the ground colour must be deep and rich, and well defined next the eye, but towards the border it is to break off regularly and symmetrically into the eiging, which
It is said to be an inhabitant of the East Indies. Lamark also names the Moluccas as its locality.

The following is the generic character—Shell somewhat oval, or ovo-oblong; aperture longitudinal, narrowed above, and with the base entire; pillar with one or more plaits; outer edge either refolded or simple and flat.

The true auricula are the inhabitants of warm climates. There is one in the south of France, near the shores of the Mediterranean (auricula mycrota or Draparnaud), but it is a small one.

AURIGA, the Charioteer, a constellation situated between Perseus and Gemini. It is represented as a man holding a bridle in the right hand and supporting a goat and kids on the left arm. The stars in the body of the goat, called Caelum, receives the name of Aiolos by the Arabs) is of the first magnitude, and presents the best guide to the constellation. There is no satisfactory account of the mythology of this figure. It is said to have been the Horus of the Egyptians; among the Greeks, the human figure is different writers call Hippodamus, &c., while the goat is Amalthea, the foster-mother of Jupiter. This explanation is even more unsatisfactory than most others, owing to the want of apparent connection between the figures of the group.

The stars Capella, never sets in the latitude of Greenwich, and is seen drawn through the higher two (α and β) of the four stars which form the body of the great bear. It is on the meridian at six p.m. early in March, and at midnight in December.
Aurilac has produced several persons of note; among them Gerbert, elevated to the Papacy under the title of Sylvester II.; Cinq-Arce, a Hebraist of some note in the sixteenth century; the Marechial and Cardinal de Nouilles; Pignol de la Force, author of an account of France; and J. B. Carrier, infamous for his atrocities at Nantes during the revolutionary period.

There are some basaltic columns in the immediate neighbourhood of the town, and in the suburbs are two mineral springs.

Aurilac, as already noticed, is capital of the department.

The arrondissement or sub-prefecture of Aurilac extends over 796 square miles, or 509,440 acres, and has a population of about 95,600. (Dictionnaire Universel de la France; Pignol de la Force; Malette-Brun; Balbi.)

AURORA BOREALIS, or northern day-break, so-called because it usually appears at or near the north, and presents a light somewhat resembling that which precedes sunrise.

The phenomena attending the Aurora Borealis are so various, in almost every particular, that no general definition can be given, and till now is more on the subject, any remarkable luminous appearance, towards the northern side of the horizon, taking place between sunset and sunrise, must be considered as entitled to that name. The following description, extracted with abridgment from the French Encyclopaedia, and enclosed in ( ), is an account of the most remarkable appearances of the kind.

In the northern region of the horizon, but often towards the east or west, a horizontal cloud (nubes) rises to some degrees of altitude, rarely more than 40°. Sometimes the blue sky is seen between this cloud and the horizon. It extends along an arc varying from 5° to 100°, sometimes more. It is sometimes whitish and brilliant, but often black and thick. Its upper edge is luminous and irregular, sometimes nearly parallel to the horizon, sometimes curved towards it. The higher part of the cloud has frequently a white and shining edge. After shooting a number of streamers, the darker part of the cloud generally changes, and becomes very luminous. The streamers continue to be shot from the upper edge, sometimes at some distance, sometimes very close to each other. Their light is very dazzling, and might lead a spectator to imagine he saw a shining liquor forced violently out of a syringe. The light is strongest, and the streamer narrowest, near the main body of the phenomenon. Columns of light issue upwards from openings in the main cloud, with a slow and uniform motion, becoming broader as they proceed. Their dimensions and time of duration are various; they are whitish, redish, and sometimes blood-coloured, and after some time the appearance of the whole rainbow, as we shall see, is presented. When several columns, emerging from different points, meet at the zenith, a small and dense meteor is formed, which appears to burn with more violence than either column by itself. This meteor is green, blue, or purple, and afterwards proceeds towards the south in the beam of a small and clear cloud. When the columns cease, the first mentioned horizontal meteor has little more than the appearance of morning twilight, and gradually disappears. The phenomenon lasts sometimes all night, and has sometimes been observed many nights in succession. The horizontal meteor sometimes keeps its place and its appearances unchanged for several hours. Sometimes the whole consists in nothing more than a gradual increase of light in the horizontal meteor, and the whole has been known to take place in a few minutes.

It is evident that the preceding account relates only to the aurora which are seen in very northern latitudes, where such phenomena are most frequent and most splendid.

To show what has been seen in our own zone, we subjoin from the work of M. de Maran on the subject, the two most dissimilar appearances which we can find.

The aurora represented above was seen at Brouclay, on Normandy, nearly in the latitude of Paris, September 28, 1726. It consisted entirely of streamers of light, as here represented, without any darker meteors.

The curious phenomenon represented on the opposite page was observed for several minutes, during an aurora which appeared at the same place, October 19, 1726.

The aurora borealis has been observed in almost every part of the world, but the frequency of its occurrence has varied remarkably from century to century. In England, hardly one such phenomenon appeared in the seventeenth and earlier part of the eighteenth century. Before that of 1716, according to Halley, no such thing had been recorded in England for more than eighty years, and none of any magnitude since 1574. No appearance is recorded in the
Transactions of the French Academy of Sciences, between 1706 and 1716. One recorded in the Berlin Miscellany for 1707 is called a very unusual phenomenon; and the one observed at Bologna, in 1723, was stated to be the first which had ever been seen there.

In the northern regions the frequency of the Aurora Borealis, as seen by travellers, led many to conclude that it was almost, if not quite, perpetual. But Celsius, who published, in 1733, 316 observations made in Sweden between the years 1706 and 1732, affirms the contrary expressly, and says that the oldest inhabitants of Upsala considered the phenomenon as a great rarity before 1716. Anderson, a native of Hamburg, who wrote on the subject about the same time, says, that in Iceland the inhabitants themselves were greatly astonished at the frequent recurrence of the Aurora, which began to take place. Torrefus, the historian of Denmark, himself an Icelander, who wrote in 1706, was old enough to recollect the time when the Aurora was an object of terror in his native country.

It was at one time thought that the Aurora Australis (as we must call it) was never seen in the southern hemisphere. The first account of any such appearance was given by Don Antonio Ulloa, to M. de Mauran. The former being at Cape Horn in 1745, and in one of the thick mists, which he describes as common in that climate, saw, whenever the mist cleared off, a light on the southern horizon, to an elevation of about thirty degrees, sometimes of a reddish colour, sometimes like the light which precedes moon-rise, but occasionally more brilliant. In 1744 an Aurora appeared at Cuzco, which very much terrified the Peruvians, who could with difficulty be persuaded by the Spanish governor that it was not a mark of divine displeasure.

To go back to older times, the Aurora is described by Arnauld (cited by Mairan), as an appearance observed by night in calm weather, and resembling flame mingled with smoke, or the distant appearance of burning stubble. He remarks that the predominant colours are purple, bright red, and blood colour: from all of which, as well as from the whole description (see his work on Meteoras, book i. chapters iv. and v.), there can be no doubt that he faithfully described the subject of this article.

Cicer, Pliny, Seneca, and various more modern writers, make allusions to, or descriptions of, similar phenomena; and there can be no doubt that the fiery appearance of arms fighting in the heavens, described by so many authors as having preceded remarkable events, must have been Aurora Borealis, heightened by the same force of imagination which converted comets into swords and other weapons. And the general terror which such appearances seem to have excited may be considered as adding a presumption to the evidence already produced, that the Aurora Borealis did not by any means occur so frequently before the eighteenth century, as it has done since.

In the work of M. de Mauran, already cited, which is, up to its date of publication (1734), a complete collection of all that was known, we find a table of all the recorded Aurorae from a.d. 563 to 1751. All the observations, including those of the same phenomenon by different observers, are 2127 in number; containing 1441 distinct phenomena. These are as follows:

<table>

Of these, the numbers observed in the different months were as follows:

- January: 113, July: 22
- February: 141, August: 84
- March: 202, September: 172
- April: 124, October: 212
- May: 45, November: 153
- June: 22, December: 151

During the winter half of the year, 972.

Near the proportion of 2 to 1.

The great frequency of phenomena in the earlier part of the first list doubtless arises mostly from want of records; but partly, it may be presumed, from the fact that many more observations were latterly made in northern climates.

The mean height of the Aurora Borealis was placed by Mauran at 175 leagues (French); but his means of ascertaining this point were very imperfect. Mr. Dalton, from later sources, concludes the average height to be about 100
That the phenomenon is really atmospheric and not astronomic, is presumed from the diurnal rotation of the earth producing no effect upon its apparent position. It has been placed by some above the atmosphere, and Euler supposed it to be at the height of more than 1000 miles above the earth.

The position of the Aurora has, in a majority of cases, been rather towards the west than the east, and it is more frequently seen in calm than in windy nights. Among the great variety of detached reports which have been made upon this subject by different observers, we may notice the following assertions:--that there is always a copious deposition of dew during the phenomenon—that in the English Channel a hard gale from the south or south-east may be expected within two or four hours—that northern lights, very brilliant instances frequently succeed a sudden thaw after very cold weather: but as we have yet no satisfactory theory on the subject, it would be useless to multiply such observations, and we only give these to remind them of a number of facts that all the meteorological circumstances attending them are considered worth noting down.

The rise of the auroral arches is mostly from N.W. to S.E.; but Professor Forbes, in 1826, traced one from the N. to S. These arches, till two or three years ago, were nearly on the horizon in the S.W. This arch did not move in the direction of the magnetic meridian, and was diametrically against the wind. (See Reports of the British Association, vol. i. p. 256.)

The Aurora Borealis is said to be frequently accompanied by sound, which has been variously described, as a hissing, a muttering, a rumbling, and a cracking noise. Murun never heard anything of the kind; but so many positive assertions have been made by other observers, that little doubt can be entertained of the occasional happening of this phenomenon. Pliny speaks of a noise of arms and sound of trumpets heard in the air.

The influence of the Aurora upon the magnetic needle must now be considered as an ascertained fact. It was first mentioned by Fullard in 1724, but Halley and Cotes had previously noticed a similar circumstance. At the same time it does not appear that in every instance the effect takes place. Much discussion has arisen from the fact, that while in one place the needle is violently agitated, in another it is not disturbed at all. In one instance the variation of the needle has been detected at a place where the Aurora was not visible, though it was seen in other parts. [See Magnetism.]

Our knowledge of the electrical phenomena of the Aurora is confined to the observation, that the electric matter may often be readily collected from the air during its continuance; though decided instances have occurred in which this was not the case,--and that a very good representation of auroral light may be obtained by passing the electric fluid through an exhausted receiver.

The Aurora Borealis must be looked upon as a phenomenon well worth observing, than which one has been well observed. The reason is that, till of late years, there has been no concurrence of such as the phenomena to be noted, or the manner of observing them. The British Association has lately directed its attention to the subject, and has published some recommendations (Reports, vol. ii. p. 246), to which we refer all who have occasion to observe. We select those points which do not require unusual apparatus.

1. Whether the Aurora is accompanied by any noise?
2. Whether there are any recurring periods of frequency and brilliancy?
3. What is the position of the phenomenon with respect to particular stars? (These may be ascertained on a globe, and very frequently the stars can be seen through the Aurora.)
4. The time of every phenomenon should be noted, and the phenomenon should be compared with a watchmaker's regulator as soon as possible after the observations.
5. The longitude of the place should be taken from a map.
6. Any person who wishes regularly to watch for such phenomena, should look carefully at the horizon every evening about the time of the setting of the sun.
7. If there is an arch, the positions of its two boundaries should be noted by the way in which they pass among the stars. Notice should be taken whether one edge is better defined than the other; whether there is a clear sky or dark cloud above or below; whether it terminates at the end in sky or in cloud, whether there is any dark band in it; whether, in its general composition, it is uniform or straitened; whether stars can be seen through it.

11. If there are beams or streamers, the time should be noted; then their position among the stars; then their height among the stars; their motion (whether vertical or horizontal); the velocity of motion (by the time of passing from one star to another); their changes; their permanency; whether they appear to affect the arch, or to be entirely in front of it.

12. If there are any black clouds in the luminous region, notice should be taken whether the streamers or the arch seem to have any relation to them; whether and in what manner they increase or disappear.

13. It is useless to observe a common magnetic needle. The one used for this purpose should be suspended by a hair.

The various theories which have been proposed to account for the Aurora Borealis give nothing entirely satisfactory. Halley and Cotes attributed it to the watery vapours of the atmosphere; the former also suggested the effluxus, by which he meant the same time proposed to explain the phenomena of magnetism. Murun wrote the complete treatise already alluded to in his Elements of the Natural History of the Heavens, in which he attributed the sidereal light extended as far as that of the earth, and being driven towards the poles (now, is not very clear) causes the phenomena observed. Euler imagined it to proceed from part of the upper atmosphere, where the electric spark causes the union of the oxygen and hydrogen and forms an electric fluid, the discharge of which he supposed to be the phenomena of the Aurora. The hypothesis of M. Libes is at least ingenious and experimental, and was at one time much adopted. He had observed, that when one of the compounds of oxygen and nitrogen was formed by the combination of the electric spark through a mixture of those gases, reddish vapours were produced, which rose in the air. He found also, that in a mixture of oxygen, hydrogen, and nitrogen, the transition of the electric spark caused the union of the oxygen and hydrogen and forming an electric fluid, the discharge of which he supposed to be the phenomena of the Aurora; whereas, little or no hydrogen.

This subject is one our knowledge of which we may expect to be rather increased. Should that be the case, we may provisionally refer the reader to Luteric, Northern

AURUNGABAD, a province of Hindustan, formerly known as the province of soulah of Ahmednagar. It is situated in the 21st Part of the World, and contains the Deccan, and lies between the 18th and 21st degree of north latitude. The limits of this province are not very clearly defined, and in common with those of other Indian territories are subject to occasional alteration. To the north it lies against Guzerat, Baroda, and Berrar; to the east, Bencoolen and Hyderabad; to the south is Bejapur, and to the west the Indian Ocean. Its length is estimated at 300 miles, and its breadth at 160 miles.

Aurungabad first became a province of the Mogul Empire in 1613. The first capital of the province when the seat of Dowlatabad was taken by the Soulehabads of Mandeshwar, who thus put an end to the short-lived dynasty of the Abyssinian Malik Amber. The fortress just mentioned was then considered as the capital of the province, and continued to be so after the Nurus had obtained the Mogul government, and until, in more recent times, the encroachments of the Poonah Mahatts made it an unsuitable residence for the Nurus, who removed the seat of his government to Hyderabad. The province is now
divided between the Nizams and the Maharattas, about one-fourth being under the sway of the former, and three-fourths under the latter.

The surface of the province is in general mountainous, especially where it is crossed by the western ghauts, the hills there rising to a considerable height. The tract of country which lies to the eastward of the ghauts, and which includes the largest portion of the province, is for the most part elevated table-land, seldom less than 1800 feet above the level of the sea. It abounds in those almost inaccessible fastnesses—the hill forts—which so often baffled the attempts of the Moguls, and were of the greatest service to the native princes in their principal tracts or islands.

In its general character, the soil of the province is fertile, producing abundance of rice; but, owing to the oppressive character of the native governments, the population is by no means proportionate to the extent or capacity of the soil. Many European fruits attain to a high degree of perfection, particularly strawberries, peaches, and grapes; the last of which are very large.

A very hardy but ill-formed breed of horses is reared in great numbers for the Mahratta service.

Aurungabad contains the sources of several rivers; among others are the Neera, the Beema, and the Godavery. The first rises in the western ghauts to the south of Poona, and passing eastward divides the province from Bejapoor, and descends in the Neer river, which enters the Arabian Sea.

The Beema rises in the mountains about 40 miles north of Poona, and passes at a distance of 15 miles from that place; thence it flows, with many windings, in a south-easterly direction, receiving several hill-streams in its course; and joins the Krishna, in the province of Hyderabad. The Godavery, one of the most sacred streams of the Hindoos, and the largest river of the Dekkan, proceeds from numerous sources in the mountains that form the province from west to east. [See GODAVERY.] These rivers do not attain to any considerable size until they have left the limits of the province.

The principal towns of the Soubahs are Aurungabad, Aurangabad, Daulatabad, Poona, Jaina, and Ilosia. Descriptions of these places will be found in this work, as well as of the remarkable excavated temples of Carli and Elora, both of which are within the province. The inhabitants are principally Hindoos; only about one-twentieth are Mahomedans. The Maratha language is that principally used, and of this there are several local dialects. Hindustani and Persian are spoken by the higher classes, the latter being used in the courts.

[See Frere's History of the Deccan; Malcolm's Memoir of Central India; Kennell's Memoir of a Map of Hindostan.]

AURUNGABAD, a city of Hindustan, within the limits of the Nizam's dominions, and the capital of the Aurungabad district. It is situated in 19° 34' N., lat., and 75° 20' E. long.

The city was originally a village named Gurka, but becoming a favourite residence of Aurungzebe during the time when he was governor of Khandesh, in the Dekkan, it speedily rose in importance. For a long time after the Nizams had shaken off their dependence upon the court of Delhi, this city continued to be the place of their residence.

Aurungabad is situated in a hollow, on the banks of the river, which, a mountain-stream, which separates the city from a considerable suburb called Begum Pooma, the communication with which is preserved by means of two substantial bridges. On the north side is a considerable marsh employed for the cultivation of rice, and it is probably owing to this that the city, from this ground, that the city is very unhealthy, and that the inhabitants are subject at all seasons to be attacked by intermittent fevers. The military cantonments, which stand about a mile south-west of the city, are designed to be free from this malady, and to be generally healthy.

Considerable industry has been shown in providing a sufficient supply of excellent water for the use and comfort of the inhabitants. This water is brought by means of several conduits from various springs in the country, which are thrown together by numerous stone reservoirs in every part of the city. The principal street is nearly two miles long, and of a considerable width, with a spacious quadrangle at one extremity, and a handsome market-place near it. The palace of Aurungzebe, which is now in ruins, covers an extensive space. Here is also a celebrated mausoleum erected by order of that ruler to the memory of his daughter; it bears some resemblance to the mohabs built by the Emperor Shah Jehan, at Agra. The whole city is rapidly falling to decay, and when visited in 1827 by Colonel Fitzclare, appeared, at least as regards its principal buildings, little better than a heap of ruins. It was still, however, said to contain a population of 60,000 persons, and to cover a space about seven miles in circumference. A considerable traffic is carried on in the bazaar, where both European and native goods are exposed for sale.

During eight or nine months of the year the wind usually blows from the south-west; in the months of November, December, and January, easterly winds commonly prevail, and at this time the variations of temperature are sudden and excessive, the thermometer changing from 86° to 60° in the same day. At other times the range of the thermometer is from 76° to 100° Fahrenheit. The average quantity of rain which falls during the year is stated to be 30 inches; but in this respect the climate is subject to much variation, and for each of three consecutive years it has been known that the quantity of rain has not exceeded 21 inches. All kinds of tropical fruits are good and abundant, and both grapes and oranges are of excellent quality.

From Aurungabad to Poona, 94 miles; from Poona to Bombay 284 miles; from Bombay 284 miles; from Hyderabad 295; from Madras 647; from Delhi 790; and from Calcutta 1022 miles, travelling distances. It is also about seven miles south-east of the fort, a town called 400 miles from Mooltan.

[See Kennell's Memoir of Malcolm's Memoir of Central India; Fernand's the Deccan; Fitzclare's Routes through India and Egypt to England.]

AURUNGZEBE was the last powerful and energetic emperor of the Mogul line, who ascended the throne in the latter half of the seventeenth century. His proper name was Mohammed; but his grandfather gave him the surname Aurungzebe (properly Aurang-zib), i.e. the ornament of the throne, and when he became emperor, he assumed the titles of Mogul-imad-ul-mulk, or Mogul imam, and the religion, and Alem-gir, i.e. the conqueror of the world.

Aurungzebe was the third son of Shah Jahan, the son and successor of the celebrated emperor Jehangir. He was born on the 22nd of October, 1618, and had just attained his tenth year when his father ascended the throne (1st February, 1628). Aurungzebe appears from an early age to have aspired to the throne of the Moguls; but he artfully concealed his ambitious designs till he had assumed the dignity and rank of an emperor. From his twentieth year, however, military duties devolved upon him, and soon engaged his entire attention. After an expedition, which the tranquillity of the empire had permitted Shah Jehan to undertake against the Dekkan, Aurungzebe's operations in the northward were arrested, the province of Khandesh, and founded here a magnificent city, which he called after his own name Aurungzebe (properly Aurang-Abad, i.e. the city of Aurang). Soon afterwards the province of Cabul was infested by an invasion of the Uzbeks. Aurungzebe was sent against them, and after a long and desperate struggle succeeded in subduing the Uzbek sovereign. But neither Aurungzebe nor Dara-Shukhun, his eldest brother, was able to rescue the city of Candahar, which Shah Abbas of Persia, during the absence of the Mogul army, had obtained by capitulation. The insurrection of Emir Jumlah, a chief in the service of the king of Golconda, Aurungzebe renewed the war, and laid siege to the city of Golconda, which only after the most severe efforts at Agra arrived, directing that terms of peace should be proposed to the besieged raja. Emir Jumlah was called to Agra, and the emperor Shah Jehan conferred upon him the dignity of viceroy. Jointly with him, Aurungzebe led an expedition against Goa, which had, after the departure of the Mogul army, been obliged to submit to very severe terms. After these events (about the end of the year 1656), the health of Shah Jehan, who was then upwards of seventy years old, excited alarm. His eldest son, Dara-Shukhun, in a.d. 1616, in endeavouring to secure the throne for himself, confined his father, and took the reins of government into his hands. He was at first opposed by his brother Sujah (born in a.d. 1616), the next in age to himself, but without effect. But Aurungzebe, under the pretense of
securing the throne to his younger brother Murad Baksh (born in A.D. 1624), then at Ahmadabad in Guzerat, invited him to join him with his forces at Ougeen, the capital of Malabar, which he had taken by violence and instruments, and the united troops of the two brothers encountered and defeated the forces of Dara Shekiah near Ougeen, and again near Agra. Dara Shekiah fled towards Lahore, and Aurungzebe having first secured and imprisoned his brother Murad Baksh, returned and proclaimed him king in the cradle of his mother at Izaab, near Delhi, on the 29th of July (according to others on the 2nd of August), 1658. His father, Shah Jehan, had in the mean time recovered from his illness; but Aurungzebe continued to keep him in custody, and removed him, in July, 1659, to Agra, where he died at the age of seventy-four years, and it has been suspected by poison, on the 21st of January, 1668.

Shortly after Aurungzebe had been proclaimed emperor, his brother Sujah repeated the attempt to possess himself of the government, but was defeated in several battles, and at last having no further means of resistance, he fled from his retreat at Darca in Bengal, and sought refuge with the neighbouring rajah of Aurungzebe, by whom he was cruelly beheaded. Dara Shekiah had about the same time returned from Lahore, and was received in the gates of Guzerat, marshalled to Delhi, when he was met and defeated by Aurungzebe near Ajmere. He fled towards the Indus, but was betrayed into the hands of his brother, and slain at Khora, near Delhi, on the 21st of August, 1659. His son Solman Shekiah had sought the protection of the rajah of Serenag in the northern mountains, but was by him delivered into the hands of Aurungzebe, who confined him in the fort of Gwalior (14th of January, 1660).

Aurungzebe, in 1659, has been proclaimed a second time, when he ordered that, for the future, the beginning of his reign should be dated from the 12th of May of that year (for the 1st of Ramazan, A. Heg. 1659). As soon as he had been acclaimed emperor, he issued a proclamation, in consequence of which, his fame was great and his administration, as his power was great and his kingdom was vast, and by the means of a great prudence and talent in his administration, his reign was peaceful and tranquil. Much credit is due to the foresight and prudent measures by which he succeeded in averting or mitigating the disastrous consequences of a famine, which visited the provinces of the Deccan in 1657.

Emir Jumlah had been appointed governor of Bengal; and his popularity excited the jealousy of Aurungzebe, who, in order to prevent him from forming ambitious designs, sent him on an expedition against the king of Assam. The arms of Emir Jumlah were victorious, but his troops were affected with a disaffection, to which disease Emir Jumlah himself fell a victim.

It deserves to be noticed that the throne of Aurungzebe had been obtained by the efforts of a secretary, who, in writing to Shah Abbas of Persia, had addressed him by no higher title than belonged to the khans of the Uzbeks. Shah Abbas, supposing this to be a premature and hasty claim, sent him a letter, and threatened to cause him to be removed, but was struck dumb by the answer, which was sent him. His name was not mentioned in the letter, but he was addressed as "The king of Persia," and one of his letters ended with "To the king of Persia." This was the first letter written by Shah Abbas to the king of Persia, and it was read with astonishment and amazement by the court at Delhi. The title of "king of Persia" was not given to Shah Abbas by the Persians, but by the king of Persia, whom he had deposed, and who gave him the title of "king of Persia." This was the first letter written by Shah Abbas to the king of Persia, and it was read with astonishment and amazement by the court at Delhi. The title of "king of Persia" was not given to Shah Abbas by the Persians, but by the king of Persia, whom he had deposed, and who gave him the title of "king of Persia." This was the first letter written by Shah Abbas to the king of Persia, and it was read with astonishment and amazement by the court at Delhi. The title of "king of Persia" was not given to Shah Abbas by the Persians, but by the king of Persia, whom he had deposed, and who gave him the title of "king of Persia." the worked states of several of the most important organs of the body.

The philosophical mind nothing is more interesting and instructive than to trace the history of useful discovery. It is clear that the idea on which the modern art of auscultation is founded, had occurred to Hippocrates upwards of two thousand years ago. "You will know by this," says the first of the surgeons of disease as described by him, "that the chest contains water and not pus, if, on applying the ear for a certain time to the side, you hear a sound like that of healing vinaiges. The non-existence of distinction in the movements of the heart, lungs, and liver, is all apparent, and extended observation; and consequently rendered it impossible to follow out to any sure and useful result the idea which had occurred to the most antient writer on physic. Accordingly, the suggestion of Hippocrates seems to have attracted no attention for many centuries, and the mode of studying disease founded upon it, if it had ever been carried to any extent in remote ages, had long sunk into oblivion. About the middle of the 17th century, a distinguished philosopher and mathematician, who was not of the medical profession, and who does not appear to have been acquainted with the writings of Hippocrates, had the penetration to see that advantage might be taken of the sounds produced by the motions of the internal organs to discover the nature of their disordered states, and he even predicted that artificial instruments were destined to be employed to this effect. But the means of percussion, not occasionally with cases in which this method afforded them little or no assistance; and in the hope of obtaining further aid, they accustomed themselves in such cases to apply the ear closely to the chest. Little practical benefit resulted for some time; but at length led to a discovery of inestimable advantage; a discovery which may be said to have enabled the physician to see into the chest almost with as much clearness as if its walls were transparent. The following is the account of this discovery in the words of the remarkable man who made it, and who, in the course of a few years, with a diligence scarcely ever exceeded, developed, matured, and systematised the highly-important practical results which it has afforded.

Laenec's work De l'Auscultation Mediate et des Maladies des Poumons et du Coeur, is a collected young woman affected with the general symptoms of diseased heart, and in whom case the employment of the hand were of little avail, owing to her being extremely emaciated. The application of the ear being inadmissible for obvious reasons, I happened to recollect a simple and well-known fact in acoustics, and fancied it might be turned to some use on the present occasion. I at first thought it possible that I might not without danger as useless. And somewhat more of encouragement I have also from experience, that I have been able to hear very plainly the motions of the heart, and have been accustomed to bear the motion of the wind to and fro in the gut and other small vessels: the stopping in the lungs is easily discovered by the wheezing. As to the motion of the parts one amongst another, to their becoming sensible, they require either that the region of the organ be filled up with air, or more powerful to sensible and distinguish them as they are for the doing of both which I think it is impossible but that in many cases there may be helps found.

This prediction has been realised: helps have been found.

About a century after this passage was written, Leopold Auenbrugger, a German physician then resident at Vienna, fell upon an artificial method of producing sounds in various parts of the body (see Percussion) by which the sound man might judge of the state of the subjacent parts. This method, esting, I believe, to the work of Auenbrugger, and made his method known to the whole of Europe. From that period the practice of percussion has been properly general, and it soon began to be put, in skilful hands, with results far more precise and certain than was expected.

The art of distinguishing disease by sound comprehends then two distinct methods, that of auscultation and that of percussion. The study of auscultation may be pursued either by the unassisted ear, or through the medium of instruments; the first is called immediate or direct, the second intermediate auscultation. In like manner percussion may be performed either on the natural surface of the body, or through the medium of some solid or dense substance firmly applied to it. The first is termed direct, the second mediater, percussion. [Auscultation.] [Auscultation.] [Percussion.]

AUSONIANS (AUSONER) are the inhabitants of the northern part of the Italian peninsula, who appear to have been a branch of the great Opeian or Ocean nation. Nisbuh shows that Auson is the Greek form of the native name Auruni, from which the adjective form Auranus, shortened into Auran-
also necessarily had the privilege of the aures attached to these magistrates. Still, to the very last, those offices which in their order were purely of a plebeian character, as the tribunate, had no connection whatever with the aures. There were many messes in the law of aures, which were matters of dispute among the aures which the heirs of a certain member of the college of aures, or sometimes to a single member of that body. The most important distinction was that which existed between the greater and the lesser aures: thus the auries of a consul were superior to those of a proconsul. In the latter, it could not, ro rule at a consular election.

In an army the commander-in-chief received the auries with the imperium, and so completely was any success attributed to this; auringen, that an officer of any inferior officer, in any part of the world, gained a victory, that success was attributed to the commander-in-chief, who perhaps might have been the whole time in the neighbourhood of Rome, and he alone was entitled to the honours of the triumph. In this case the lieutenant was said to fight under the aures of the commander-in-chief. As the ceremony of the aures was originally employed to sanction the commencement of every important undertaking, whether public or private, the word auringen, to take the meaning of the Latin word, would signify the signification of commencing any matter of importance.

AUSTELL, or AUSTLE, ST, a considerable market-town in the east division of the hundred of Powder, in the county of Norfolk, 6 miles from Norwich, 12 from St. Ives, and 243 miles S.S.W. of London, 61 from Lowestoft, 46 from Southwold, to Grampound, Truro, Redruth, and St. Ives; 243 miles S.S.W. of London, 61 from Lowestoft, and 13 from Truro. It occupies the side of a hill, and slopes gradually to a small rivulet that waters a narrow valley. The streets are narrow and dirty, and, with the few natural conveniences of the town, is a considerable thoroughfare. The church is a handsome fabric, consisting of a nave and chancel, with side aisles separated by clustered pillars. It has a good tower, adorned with singular sculpture; some parts of the arches, also, are of marble. The church is dedicated to St. John, of whose story the tower are several rude statues in richly ornamented niches. There are many figures on the west side, and four on each of the others. Those on the west side are described in the MS. collection of the British Museum.—*The uppermost niche has the figure of God the Father, with the crucifix. This niche is supported by two angels holding a cloth including some little figure praying. In the next row of niches, St. Gabriel and the Virgin pray with the holy pale in his left hand. This niche is in the centre with [his] right hand elevated, the cross in the left, and the crown of thorns on her neck. This niche is richly ornamented with scrolls of foliage on the side. On the right hand of this niche [is] a saint with a staff in his right hand, and another in his left on the top. The remaining twelve figures, on the other sides, are supposed to be the apostles. Over the south porch is an inscription in stone relief, of the meaning of which the best-informed antiquaries seem to doubt. Various sheaves of corn are carved on the outside of the church, and on the seats; and from the frequent occurrence of the slovenly, hammer, &c., it would seem that the masons were the chief contributors to the building. The font is a very ancient one, adorned with beautiful sculpture. The chancel arch, built of white marbles, gave an endowment for a chantry chapel in the churchyard of St. Austell, and there was once a sanctuary here.

St. Austell was described by Leland, in the time of Henry V, as a town of great importance, and had the peculiar privilege of being served by a great mine of tin, the revocacy to the great tin mine of Polgothen (which part in this parish, and was at one time esteemed the richest mine ever worked in England), and other considerable mines. It still owes its principal importance to the tin mines, the copper mines of Chilcomb, and the copper plate of the parish. The pitcher bakery is carried on to a considerable extent (for the parish extends to the coast, though the town itself is a little inland), and there have been hatteries formed at Chalweston and Pentewan for the conveniences of importing rosewood from West Africa and cornish tin from the porcelain clay of the district. A railroad connects the town with the harbour of Pentewan. There are, at the west end of the town, three blowing-houses (for some years the only ones in the county) for smelting ore. The ore received in these houses is for some purposes preferable to what is sometimes an
the common way. Copper ore is said to have been smelted at St. Austell before any other place in Cornwall. There is a dock and shipwright's yard at Charlestown, and the manufacture of coarse woollens was carried on in St. Austell some years since, but whether it is still continued, we have no information. There is at Pentewan a famous stone quarry from which stone has been got for building many churches and gentlemen's seats in the county.

There is a considerable weekly market on Friday for corn and other articles. It is held under a charter granted by Charles I. in 1629, for length of the said market and the benefit to the relief and maintenance of the poor. There are two fairs, one on the Thursday in Whitman-week, and the other on the 30th November. It is said there was once another fair, viz., on the 18th of September, but the custom lapsed. The Court of Assize (the most considerable of the Stannary Courts) being held here has contributed to the prosperity of the town.

The parish includes several villages; of which the principal are, Carveth, Corbean, Penchant or Pentewan, Porrean, Rescorla, Tregoninney, Tregonrick, Trenarren, Tretherry, Trevarrick, and Charlestown, formerly Porthmeor. The number of houses in the whole parish, in 1831, was 1626 (including 13 building and 70 uninhabited), and of inhabitants there were 672 males and 639 females, a total of 1311. This is a considerable place. The number of inhabitants has more than doubled within the last twenty years. This is ascribed to the demand for labour in the mines.

The living is a vicarage in the gift of the crown. It is in the diocese of Exeter, in the archdeaconry of Cornwall, and the dioecese of Exeter. There are several dissenting places of worship; also an alms-house built in 1809, but not endowed. There was an ancient free chapel at Menacuddle, in the parish of St. Mary at Milline, and another at Trewhian Cove.

The town of St. Austell, which is part of the parliamentary county, and in which the Earl of Essex, who was quartered during the great civil war, was taken by Charles I. in the year 1644, and held for the king until the year 1650. The old town of St. Austell was a little distance to the east of the present. Its site is still marked by a few cottages.

AUSTERLITZ (also called Slawcow) is the chief town of the principality of Kauisits-Rittel, in the circle of Brun, in Moravia, and about nine miles east of the town of Brun; it lies on the Littawa, and with its suburb contains about 300 houses, and 2200 inhabitants. A handsome palace was there at this period, which with the present palace of the Vanower dominions, Plett succeeded in forming a coalition, to which Austria and Holstein became parties in 1805. Napoleon lost no time in rapidly pouring his troops into the heart of Germany, where he cut off the retreat of 24,000 Austrians, under Field-marshall Mack, shut them up in Ulm, and forced them to surrender on the 17th of October. On the 11th of the following month Napoleon entered Vienna, and the Emperor Franz, having removed his Austrian headquarters to Olmuts, in Moravia, was there joined by two divisions of the Russian army, under Buxhövden and Kutsows. The arrival of the Emperor Alexander on the 24th was the signal for the movement of the allied forces against Brünn, with the view of ousting the Turks from 40 miles, and of making the temporary centre of his operations. Napoleon gained a complete victory at Austerlitz. The first result of the battle was an armistice, the terms of which were dictated by Napoleon on the 6th of December; the second was the treaty of alliance concluded between Berthier and Prince Lichtenstein, the French and Austrian plenipotentiaries, by which it was agreed that Austria should abandon the Venetian territories in favour of the Kingdoms of Italy, and renounce her possessions in the Tyrol and Styria; the latter being designated by the conqueror for distribution between the Wurtemberg, Bavaria, and Baden sovereigns, as a reward for their co-operation. This campaign cost the Austrian crown nearly 24,000 square miles of territory, 2,786,000 subjects, and an income of 1,300,000,000, sterling, independently of severe temporary sacrifices. [See Bonaparte.]

AUSTIN, St. [See Augustine.]

AUSTRALASIA. [See Australia.]

AUSTRALIA is the name recently adopted to designate all the countries which are considered as forming the 5th great division of the globe. Up to the middle of the last century, and still later, theoretical geographers, from the fanciful idea of the necessity of an equilibrium in the solid structure of the earth, supposed that there existed an immense continent surrounded the Antarctic Pole, and this imaginary continent was called by them Terra Australis. When the errors of these speculative geographers were corrected by astronomical and geographical observations, and the map of Captain Cook, all the islands lying to the south of Asia and the southern part of Africa, which had already received proper names. It did not seem convenient to the geographers of that period to add these islands either to Asia or to America; and they wished therefore to devise a new name which comprehended all of them, and at the same time express their position on the globe. The English adopted Austrailia, the French Oceanie, and the Germans changed the Terra Australia into Australien, which name at present seems to have obtained general acceptance.

The islands composing Australia are situated, as we have already observed, partly to the south of Asia and partly in the wide Pacific Ocean between Asia and America. From America they are divided by a wide and open sea, but from Asia there is no natural boundary, and every one of the islands belonging to Asia. When the Portuguese and the Spaniards, in the beginning of the sixteenth century, began to be acquainted with the islands of India, they only discovered those which offered some mercantile advantages, and made settlements in such as were capable of furnishing provisions, expense and till of a conquist. Those islands which did not offer such advantages, and which were consequently neglected by them, were not considered by their successors as worth the expense of settlement. Thus Timor and the Moluccas, and the Moluccas and New Guinea, and at a short distance from the former, are included in Australia. In this island consists one very large island, formerly called New Holland, and now the continent of Australia, or briefly, Australia, lying between 115° and 135° E. long., and 30° S., and of an indefinite number of smaller islands lying to the S. E. and N. E. of this continent, between 130° and 160° W. long., and between 10° N. and 30° S.

The continent of Australia extends, in its greatest length between Sharks Bay on the west coast and Cape Sandy on the east, 2400 miles; and from north to south between Cape York on Torres Straits to Cape McIlwraith on Bass Straits, about 1700 miles. Its average breadth may be nearly 1400 miles. Timor and Timorlaut are the nearest of the Asiatic islands; the former being about 290 miles distant from Cape McIlwraith, and the latter equal distant from Cape Cobourg Peninsula; but the continent approaches nearer to New Guinea, which is separated from it by Torres Straits, not quite 90 miles wide at Cape York. Australia is divided from Van Diemen's Land by Bass Straits, which extend from 45° N. to 30° S., and from 165° E. to 139° E. long. The other islands belonging to Australia lie in the Pacific Ocean, either in groups or scattered singly over the wide sea. They may be divided into those to the north and those to the south of the equator.

To the north of the equator, between 14° and 15° E. long., are three groups, the Bonin Sima Islands, the Marianas or Ladrones, and the Carolinas; the latter extend to 165° E. long. Nearly contiguous to the Carolinas, between 14° and 15° E. long., are Lord Mulgrave's Island, forming different groups, other than the Recherche and Marshall Islands. Gilbert's Archipelago, situated on both sides of the equator, is likewise considered as belonging to Lord Mulgrave's Islands. The group of the Sandwich takes lies at a great distance between 150° and 160° W. long., and 19° and 23° N. lat. The inhabitants of these
islands belong to the Malay race, except the Boun Sima
islands, on which the Japanese have settled.
South of the equator, and between it and the continent of
Australia, is the large island of New Guinea, which ex-
tends from about 10° N. lat. to 30° S. lat., over a
considerable degree of longitude. East of it lies the Admiralty
Group and the islands of New Britain, New Ireland, New
Hanover, and the Lusinde Archipelago, which are fol-
lowed by the eastward Solomons' Archipelago. All these
islands lie between the equator and 10° S. lat., and are
inhabited by nations belonging to the Austral Negros or
Papuas.
Between 10° S. lat. and the tropic of Capricorn lie the
following islands and groups.—New Caledonia; the New
Brisbane and Marcus Islands; the Santa Cruz; the Trinity
Islands; the Friendly Islands; the Navigators' Islands;
Cook's Islands; Society Islands; and the Dangerous
Archipelago. North of the latter group are the Mendana
or Marquesa Islands, lying between 5° and 10° S. lat.
At a great distance from these groups are situated Easter
Island and New Zealand; the former lies in 27° 8' W. lat.
and 100° W. long., and the latter, consisting of three islands,
between 34° 48' S. lat. and 178° 46' E. long.
Here begins the group of the Friendly Islands. The last of the Dutch
navigators who distinguished himself by discoveries in these
seas, was Jacob Roggeveen, who, in 1720 and 1722,
discovered some islands of the Dangerous Archipelago, and
a part of New Caledonia.

1. Discovery of Australia.—It happened that the Por-
tuguese, who, having discovered at that time the Fernan
do de Magalhaens, after opening an entrance to the
Pacific Ocean, by the discovery of the strait which is
named after him, sailed round the world, and discovered the
Philippines nearly about the same time. The Portuguese
found an entrance to the Pacific Ocean in the Moluccas, and
not extend their navigation farther to the east or south,
except that they probably discovered the island of New
Guinea or Papua. But the Spaniards having conquered
Mexico and settled on the Philippine and Molucca Islands,
soon established themselves in the Moluccas and Manilla.
Their vessels annually traversed the Pacific Ocean, but
they always followed the same track, they made at first
no discoveries in these seas except the Marianas and Caro-
linas, which lay in the route of their vessels. Don Jorge
de Vargas, in 1558, sailed from the Moluccas to the
islands of New Guinea, or Papua, in proceeding from Malaca to the
Moluccas. Alonso de Mendonza, in 1567, discovered Solon
Archipelago. Towards the end of the sixteenth cen-
tury (1593), he was sent by the Spanish government on
an expedition to the South Seas, in which he discovered the
group of the Mendana Islands and those of Santa Cruz.
In the beginning of the seventeenth century, Pedro Fernandez
de Quiros and Luis Vex de Torres undertook another
voyage, and in 1602 they discovered the Terra del Espiritu Santo, which,
when rediscovered by Cook, was found to consist of many
islands, and was called by him the New Hebrides. Torres,
being separated from Quirors, sailed along the southern
coast of New Guinea, and passed through the straits which
separate that island from the continent of Australia, and
which at present bear his name. He saw the coast of
Australia, at its most northerm point, Cape York, only a
few months after it had been discovered by the Dutch, but
he was not aware of its being part of a vast continent, and
thought it was some islands of small extent. After this
voyage the Spanish nation fell into such a state of inactivity
that they thought no more of discoveries.
Not long after the voyage of Quiros and Torres, the
Dutch East India Company had successfully established the Portuguese
on the continent and islands of India, and to establish an
active commerce with these countries. Being eager to ex-
tend their conquests and commerce, they went in, 1605, a
vast, called Duyien, from Timor, to explore the coasts of
Australia, to the south of Endeavour's Strait, on the eastern shore of the Gulf of
Carpentaria. This happened in March, 1606, only a few
months after the discovery of Cape York. The Dutch
did not at first pursue their voyage of discovery, though the
greatest portion of the coasts of the continent was
shortly afterwards first accidentally seen by their vessels
carrying on the commerce between Europe and Batavia.
In 1618, The Dutch East India Company, in a part of the western
coast, between 28° of E. and the tropic of Capricorn, and
called it Endracht's Land (Country of Concord), from the
name of the ship by which the discovery was made. After
this time, discoveries on these coasts followed closely on
one another. In 1818, the coast from about 11° to 15° S.
lat., was discovered by Zehden, in south-eastern part of
this quarter of the island from the entrance of the Gulf
of Carpentaria to Cape Talbot, and to have called the eastern
part of his discoveries Arnhem's Land, and the western Van
Diemen's Land. The following year, Von Blias sailed
nearly along the coast of New South Wales, and to have
called it New England; and the second, after the governor of
Cape, who explored the Gulf of Carpentaria with tolerable
accuracy. Thus the Dutch navigators discovered somewhat
more than half the coast of the continent of Australia.

The regular voyages of discovery undertaken by the
Dutch were less successful. Simon van der Stadt (1615—1617)
discovered the straits of Le Maire, between Terra del Fuego and the Blain Land, and entered the Pacific
Ocean by Cape Horn. In this ocean, however, they fell
broadside with the Spanish ship, and the Master of the
Archipelago, and with the eastern part of New Ireland.

Avelin Tasman (in 1642) discovered Van Diemen's
island, which, up to the close of the last century, was thought
to be a part of the continent of New Holland; and after
this the French, Dutch, and English each made voyages there, but they did not add to the number of discoveries.
Before the middle of the eighteenth century, the discoveries of
the English were of great importance. Captain Wallis and
Carpent (1767—1868) discovered the Society Islands, New
Ireland, New Britain, and New Hanover, and some other
islands of least extent. They were closely followed by
Captain Cook, who, in his three voyages, besides exploring
and surveying a large number of the islands formerly known,
covered the entire coast of Australia from Cape York to Cape York, which was called by him New South Wales, with New Caledonia, the Sandwich Islands, and many
smaller islands. After his voyages, many other English-
men explored these seas successfully. Lord Malgraves
Islands were discovered in 1778, and the Fugue Islands
were discovered by Lieut. Phipps, in 1779 by Bligh. After the establishment of the English
colony in New South Wales, those coasts of the continent
which till then had not been visited by Europeans were
explored. Bass and Flinders discovered, in 1796, the strait
which separates Van Diemen's Land from the continent;
and the adjacent coast of the continent was called Bass
Land. In 1800, Grant discovered the coast to the west of
Bass Land, up to Cape Northumberland; this portion of
the continent bears the name of Grant's Land. Flinders, after
having surveyed Van Diemen's Land, discovered in 1802, in the
extreme west of the continent, a portion of the coast of the
island of Tasmania, which is called Flinders' Land. Thus, nearly all the remaining part of the
coasts of continental Australia, unseen by the Dutch, were
discovered by the English in less than fifty years; only a
few portion being left undiscovered. In 1825, the last
remaining undiscovered, and was afterwards explored by the
French.

The French government, in the last century, undertook
certain voyages of discovery, but with little success.
The most fortunate was that of Baudin (1805—1809),
who, besides visiting some other groups already previously
known, discovered the Navigators' Islands and the Lusinde
Archipelago. In the present century, under Napoleon,
Captain Baudin succeeded in discovering and exploring, in
1805, that part of the southern coast of the continent which
lies between Flinders' Land and Grant's Land, and gave it the name of Napoleon's Land; but on our charts it is commonly called Banks' Land.

As so short a time has elapsed since the complete discovery of the coasts of Continental Australia, it cannot be a matter of surprise that we are so little acquainted with the interior. After the establishment of the English colony at Fort Jackson, in 1798, the settlers began to penetrate into this great district; but their progress was soon stopped by that mountain-range which runs along the coast of New South Wales, at no great distance from the ocean. For many years their attempts to cross these mountains were beset with so many difficulties that their progress was insuf-

ficient, as by the rivers which form the highest summits, and because they probably had never been passed by the natives. At last an attempt made in 1813 succeeded; and during the last twenty years the progress of discovery in the interior, at least, has been very considerable.

The coast of Arnhem's, Van Diemen's Land, and of a large portion of De Witt's Land, was surveyed by Captain King. But that portion of the coast of De Witt's Land which extends from Cape Villiers to Depuch Island has not been surveyed, and is nearly unknown.

The coast between Depuch Islands and North-West Cape was surveyed by Captain Philip P. King.

Shark's Bay was surveyed by Dampier.

The mouth of Shoalwater Bay was explored by Mr. Leeuwin was surveyed lately, at the time when the settlement on Swan River was formed (1825).

The southern coast of Australia, from Cape Leeuwin to Encounter Bay, was surveyed by Captain Flinders.

Some of the islands belonging to Australia have been surveyed with great accuracy by English navigators; those especially are Flinders Island, New Zealand, the Society Islands, the Friendly Islands, and the Sandwich Islands. Others, as Solomon's Archipelago, the islands of Santa Cruz, and the large island of New Guinea, have not had this minute examination.

III. Physiography. Very lately an idea pre-

This was inferred from the navigators, who surveyed the coast with accuracy, not having been able to discover the outlet of any great river; and it received great sup-

This is not proved that the land generally occurs, but in a great distance from the coast, and that the interior was an immense basin, where an extensive lake received all the water flowing down from the elevated ridges surrounding it on all sides of the coast.

The coast between Cape Leeuwin and Cape Wil
er's Gulf, on an extent of coast of nearly twenty-five degrees of long. observed only very few eminences which desired to be called hills, and nearly all of them were composed of sand. Never was an any part was a high country visible behind the low coast. The country about Spencer's Gulf up to Bass Strait and Cape Wilson is more hilly; but even here large tracts of the coast are low and no mountains are visible. Along the coast of New South Wales, from Cape Wilson to Bass Strait, the country is generally low, and in many parts is rocky and mountainous. But on the northern coast many extensive tracts of low land are found, as on the eastern and southern parts of Carpenter's Gulf, on Van Diemen's Gulf, where the alligator rivers discharge their waters, and towards North West Cape. That portion of the coast which has not been surveyed may also be a low land. The western shores, however, are, in many places high and precipitous, especially to the south of Dirk Hartog's Island; and even where they are low, a range of mountains appears to extend far into the sea. On the whole, the general surface of the country, on the character of the coast, it is evident that all the watercourses formed in the interior may easily find their way to the sea which washes the southern and northern shores. It might further be observed, that even the most careful navigators, though seeing a range of low hills in an inlet, which is the mouth of a large river, especially where the shores are low and sandy: this happened to Captain Flinders, whose general accuracy can be relied on. He did not observe the situation of this former one of this mouth, but a point, lately discovered by Captain Sturt, finds its way to the sea; yet this river probably flows upwards of a thousand miles, and surpasses the Rhine in the length of its course.

We are still far from being in possession of sufficient data to form a general idea of the interior of Australia. Except a small tract along the western coast, both to the north and south of Swan River, only the south-eastern part of this continent has been explored; and this does not embrace one-eighth of the whole area, and comprehends only one-fifth of the country to the south of 30° S. lat. and to the east of 140° E. long.

This region is traversed by a range of mountains which begins at the most southern point of Australia, Cape Wilson, and runs generally nearly due north up to 28° S. lat. Probably 30° 30' S. lat. is an inconsiderable bend to Cape York, at Endeavour's Strait. The distance between this mountain range and the shore is not everywhere the same. South of 30° S. lat it averages between forty and fifty miles, but towards the north it declines somewhat to the west, and continues in this direction to 32°, where its distance from the sea is 140 miles, at the sources of the river Hunter. It then turns suddenly to the east, and continues in this direction for about fifty miles, and again reappears in its former course, at a distance of about 80 or 100 miles from the shore. The southern range up to 33° is called the Blue Mountains: that portion of it which lies in the direction of west and east bears the name of Liverpool Range; and a great number of ranges extend from this range, which extends to the west of Sydney appears not to rise much above 3000 feet; Mount York, one of its highest summits, attains only 3292 feet. The average breadth of this range is about fifty miles, and it is difficult to cross, as the higher part consists of steep and bare rocks and deep chasms, and contains only a few passes. This description, however, does not apply to Liverpool Range, where the upper part of the ridges is flat, or forms little hills and valleys divided by very steep and narrow passes, and at a distance of a few miles from the coast, the country is covered with rank grass. A newly-made road leads over this range from Sydney to Bathurst.

The country between the dividing range and the sea may be called rather hilly: the flats which are generally found along the coast are, however, in a great distance from the coast, though in some few they extend forty miles inland, and almost to the dividing range itself. These flats have a sandy soil, of indifferent fertility; but the hilly districts of the country, which in a few places, as at Illawara, New Castle, and Port Macquarie, deserve to be mentioned, are of a better description, except where they are composed of bare rocks. The valleys have commonly a strong soil, which in its natural state is covered with large trees, and displays a very vigorous vegetation; but when cultivated it yields good crops of grain. South of 33° S. lat. the ridges of the hills and the valleys between them are parallel to the principal range; and here the rivers, of which the greatest
part are only torrents, run in longitudinal valleys, which circumstance gives them a much longer course than they would have if they flowed directly into the sea. Thus the Hawkesbury River has a course of about 200 miles. Its sources are in the mountains which enclose the alpine lakes of George and Bathurst, of which the former is upwards of twelve miles long and about five broad. After the union of several small riviets the river is called Wallandilly (Sturt) or Walladilly. After flowing several miles nearly east, it runs for perhaps 150 miles north and north-east, gradually approaching the sea. Near 34° lat. it is joined by the Cox River, and after this junction is called Warragamba. About 400 miles from the mouth of the Corangamite, to which it gives the right, it again changes its name to that of Nepean, and before it makes the last great bend to the E. S. E. it takes the name of Hawkesbury: its estuary is called Broken Bay. The Shoal River, which runs south of 34°, runs for about 80 miles parallel to the sea from S. S. W. to N. N. E., till having approached the Walladilly, it suddenly changes its direction, and flows nearly east till it discharges its waters into Shoal Haven.

North of 32° lat. the interior valleys are transverse, and the course of the rivers is consequently west and east. The Hunter River runs about 140 miles in that direction, dividing, however, considerably towards the south. The course of the Manning River and that of the Hastings divide the country into northern and southern halves. The Cumbene River, which falls into Moreton Bay, and is navigable twenty miles inland for ships drawing sixteen feet water. (P. Cunningham.)

The interior of Australia, which displays such peculiar features in its forms and aspect, may be divided into the region of the Terraces and that of the Plains or Lowlands, and the 148° meridian may be considered as the mean line of division between these two regions; observing, however, that on the south, especially between the rivers Lachlan and Morumbidgee, the Terraces may extend somewhat farther west, and on the north may fall short of this line of division. The terraces, which may be considered as the western declivity of the Mountain range, which extends past the 148° meridian, and which has been formed or composed of more or less extensive plains, separated from one another by low ridges of hills. The plains, which often extend twelve miles and upwards, commonly occur in the immediate neighbourhood of some river; sometimes they occupy the high country between two rivers; they are either dead flats or a succession of gently swelling hills, clear of timber and covered with luxuriant herbage, which affords abundant food to cattle. The low ridges which divide them are regular in their forms, and the shepherds or sheepmen may gallop in perfect safety, and are generally commodious for excellent grazing tracts. Captain Sturt observes that these ridges decrease in height as they proceed to the west, and adds, as a peculiarity, that every ridge presents a new rock. The ridges are succeeded, in some places, in huge white masses, granite, chlorite, micaceous schist, sandstone, chaledony, quartz, red Jasper, and conglomerate rocks. The quantity of sheep and cattle which pasture on these terraces is already numerous, and by far the greatest part of the wool exported from Sidney is furnished by the shepherds of this district. Some of the terraces are better adapted for cattle than for sheep, and are noted for their dairy, as Bathurst Plains.

Here we meet all the rivers which drain those terraces rise in the dividing range, and are full and rapid, though not well adapted to navigation. Before they descend into the Lowlands which extend farther to the west, they join one another, and form a few large rivers. Such are especially the Morumbidgee, the Lachlan, and the Macquarie. The Morumbidgee, which originates in the mountainous country uniting the Warragong mountains with the dividing range at some distance to the south of Lake George, runs in a north-western direction until it issues from the mountains between the terraces, where it is joined by the Lachlan, called by the natives Colah, are not yet known, but it is certain that the Lachlan and the Morumbidgee, and the upper course of this river is in the same direction as that part which is known, from south-west to north-west. It descends into the Lowlands to the west of 148°, without joining any other considerable river during its course through the terraces. The Macquarie is supposed to rise near the point where the 34° parallel is cut by the 150° meridian, and to approach the road leading from Sydney to Bathurst. Here it is called the Fish River, but uniting, before it reaches the town of Bathurst, with the Campbell River, it takes the name of Macquarie, and continues its course to the north-west, through a fine country, till having formed a cataract near the 148° degree of longitude, it enters the Lowlands. Only 240 miles of its whole course, which is above 600 miles, belong to the Lowlands.

It is remarkable that the courses of these rivers decline much to the west, as if they were to disappear farther west, for the only river among which the 150° meridian, the highest known part of which is called Hardsivicka Range. These rivers seem also to change their course, and, declining to the west, to descend into the Lowlands.

The country south of the Murraybidge displays the same features. Captain Sturt describes it as a district whose surface is hilly, broken, and irregular, containing deep ravines and precipitous gorges: farther to the west, where the Warragong and Macquarie rivers have their summits, their summits are covered by lofty and distant peaks. This part of the Terraces is still less known than that to the east of Hardsivicka Range.

The Lowlands join the Terraces on the west; their extent in that direction, as well as to the south, is in such a way that the country traversed by these rivers is enclosed by two high ranges, the dividing range and another further to the west running north along the 150° meridian, the highest known part of which is called Hardsivicka Range.

The plains of Australia are, in many parts, extremely level; in others, they are slightly undulating; and in some of these plains of more than 100 miles, sandy regions of more than 100 miles, which hardly deserves to be called a hill: the loess of these eminences are not above 300 feet higher than the plain on which they stand. The country over which the aborigines of the interior the soil presents only two varieties: it is either a red sandy loam or a white coarse sand. In some places it is entirely destitute of vegetation, at others it nourishes only salubrious plants, without a blade of grass between them. Others again are covered with polonum, a glossy and leafless bramble; and on a few patches tracts of ground are discovered which appear to be moist, and in which the calyculum is abundant. Such patches probably form quicksands in the rainy season. These parts of the plains which seem to have the best soil produce stunted gum-trees and areas, which are composed of country are covered with shells and the claws of cray-fish, and this soil, although an alluvial deposit, is superficially sandy. They bear the appearance not only of being frequently undulated, but also of the soils having been dissected from them. On their surface no accumulation of rubbish is observed as to indicate a rush of waters to any one point; but numerous minor channels are traced, which evidently distribute the floods equally and generally over every part of the area which is such as Lake Yarramundi.

"My impression," says Captain Sturt, "when travelling the country to the west and north-west of the marches of the Macquarie, was, that I was traversing a country of comparatively recent formation. The sandy nature of the soil, the greater number of small streams, the absence of trees near the plants, the appearance of its isolated hills and flooded tracts, and its trifling elevation above the sea, generally contributed to strengthen these impressions on my mind."

It would appear that these plains inaccessibly decrease in
the water, and the current was so sluggish as to be scarcely perceptible. These general appearances continued for about three miles, when our course was suddenly and most unexpectedly checked. The channel, which had promised so well without any change in its breadth or depth, ceased altogether; and while we were yet lost in astonishment at so abrupt a termination of it, the boat grounded. Examining this spot with peculiar attention, two creeks were discovered, so small as scarcely to deserve the name, and which would, under ordinary circumstances, have been overlooked. One branched off to the north, the other to the west. The Morumbidgee and full reached the sea; that yea, and the latter about twenty yards, where they terminated.

The large rivers traversing the lowlands, which always have water in their channels, are the Morumbidgee and the Murray, the Lachlan, the Macquarie, and the Darling. The Morumbidgee and full reach the sea; that yea, and the latter about twenty yards, where they terminated.

is supposed by Captain Sturt to be the Darling. Up to this junction the Murray continues to flow to the W.N.W., but afterwards its course is changed to the S.W., and the river is considerably increased in size. As it approaches the 140° meridian, it trends to the south; and in this direction it flows into the Lake Alexandrina, which is 50 miles long and 40 broad, but generally very shallow. The water of the lake is brackish, and it communicates with the sea at Encounter Bay, by a passage impracticable even for the smallest boats. The river Murray, however, is navigable for vessels of considerable burden, being, for 50 miles from its mouth, 350 yards broad and from 20 to 25 feet deep.

The Lachlan river, after descending into the lowlands, traverses considerable marshes in 147° E. long.; and, shortly after issuing from them, it changes its course from north-west to south-west. Flowing in this direction to 145° long., it again enters some marshes, which appear to be much more extensive, and to continue to the place where the river joins the Morumbidgee, 143° 30' E. long.

The Macquarie may be considered as entering the lowlands at the place where it forms a cascade, 148° 3' E. long., and 31° 50' S. lat. It soon afterwards diminishes very much, and scarcely deserves to be called a river at Mount Harris, where its current is very sluggish. At no great distance farther to the north it enters the marshes; but Captain Sturt discovered a channel, which is commonly dry, by which the superabundant water of the marshes, after long rains, is carried off to the Morrisett Ponds and the Castlereagh River, and thus to the Darling.

Vol. III. — R
The Darling has only lately been discovered by Captain Sturt. He traced its course between 146° and 147° E, long., and 30° 30' S. lat. to 31° 25' S., or for about 1,445 miles between 146° and 144° 30' S. lat., and 39° 30' S. lat., for about 66 miles. At the first place the river runs nearly from east to west; and, in the second, its course is directed to the S.W. That both currents belong to the same river is proved from the fact that they do not seem to be produced by wind, but resemble rather, as a sailor would say, the outfall of two rivers, which latter begins to run southward, is the Darling, though he observes that the waters of that river are not brackish.

The climate of Australia differs considerably from that of other countries. The most remarkable as well as the most unfavourable to cultivation, is the dry season, which occasionally prevail. Captain Sturt says, 'The year 1826 commenced the fearful droughts, to which we have reason to believe the climate of New South Wales is periodically subject. It continued the two following years with unabated severity. The surface of the earth became parched up, and the minor vegetation ceased upon it. Culinary herbs were raised with difficulty; and crops failed even in the most favourable situations. Settlers drove their flocks and herds towards the sea, and lived in fear of the pastures which sufficed equally with the coast; and men at length began to despond under so alarming a visitation. It almost appeared as if the Australian sky was never again to be traversed by a cloud. These seasons without rain appear to occur every two or three years, and are followed by excessively long rains; but afterwards the rains decrease gradually, year after year, until they again wholly cease for a time. Another peculiarity is the quick transition from heat to cold. During the summer months the thermometer often sinks to 25 degrees in fifty minutes. This is owing to the sudden change of the winds. The north-west winds blowing over the great sandy deserts in the interior, attain such a degree of heat, that they become too searching to be pleasant to man. But the occasional breezes from the south-east are invigorating. The thermometer then rises suddenly from 80° to 110°. On the other hand, the south-east winds are often very cold and piercing, especially when there is a sudden shift from a hot north-western.

But, in spite of such occurrences, which are to be considered as exceptions, the climate, though somewhat too dry, is commonly delightful; and the evenings and mornings are pleasant as in southern Italy. Even the great heat which occurs does not produce relishing and enfeebling effects on the constitution. On the lower part of the coast, the thermometer ranges in summer (from September to March), between 76° and 84°, its mean elevation being 78°; and, in winter (from March to September), between 73° and 89°, its mean elevation being 81°.

In the interior, and to the west of the mountain-ranges, the wet season commonly takes place during the summer; on the coast, it commences in the beginning of the winter. Mr. Oxley thinks that the early winter winds, which prevail during the winter drive back the vapours collected from the sea, which, being attracted by the eastern declivity of the mountains, descend in rain on the country between them and the sea; but that the easterly winds, which prevail during the summer, carry the vapours over the mountains, which, being there attracted by the western declivity of the mountains, are condensed into rain.

Dews are very frequent and heavy, and sometimes they fall like a deluge. Rain storms are common in December and January.

On the low coasts frost is very little felt; but in the hilly districts it is frequent, and very keen on the high terraces on the western side of the mountains, especially on the plains of Bathurst, and the plains contiguous to them; these districts are 2000 feet above the sea. It is likewise observed, that in these parts of the country the seasons are nearly a month later than on the low district on the coast. The snow lies on the tops of the mountains, and occasionally also upon the plains for a day or two together; but it is absolutely unknown in the neighbourhood of Sidney and other parts of the coast.

The climate on the eastern coast is very favourable to health; the seasons are not known, with the exception of opthalmia, which occurs in the months of October and November, and is produced by the winds which prevail at that time. These winds, in general, are not unpleasantly warm; but they occasion in the Kauri essence, a white gum which blooms in April and May: like them, they occasion blights in vegetation, and are considered as the cause of the then prevailing opthalmia.

Many of the islands belonging to Australia contain volcanoes, and some of them are supposed by some to be of that nature. In all those islands volcanoes products abound.

IV. The Mass of Australia.—The natives of this portion of the globe belong to two races,—to the Malay, and another, which seems to constitute a separate division of the human race: the men of the white race inhabit the north of the continent, and the resemblance to the African negro, have obtained the name of Australian negroes, or Austral negroes. The first race occupies all the islands to the north of the equator, and to the south of it those which lie to the east of 50° W. long. The Austral negroes inhabit the group several islands which lie to the west of this line, as well as Van Diemen's Land, New Caledonia, the New Hebrides, New Britain, the Solomon's Archipelago, and New Guinea. In the last-named island, they go under the Malayan name of Papuans, which sometimes is used to indicate the whole race. The same race inhabits the Australian Islands, as well as the interior of some islands of the Indian Archipelago, and a few families are scattered in the central parts of the peninsula of Malacca. [See MALAY.]

The Australian jungles are traversed by Cuvier as being a branch of the African negroes, resemble them only in the colour of the skin and their woolly hair; yet even their skin is not quite black, like that of the Africans, but a sooty brown. They differ widely from each other in the form of the body, and the whole frame. Their forehead rises higher and the hinder part of the head projects more in the negro. These projects more from the face, and the lips are not so thick. The upper lip is larger and more prominent, and the forehead projects from the lower jaws to such an extent as to divide the face into two parts. Their limbs and the whole frame of their body are lean, and display nothing of the muscular strength by which the African negroes are distinguished. The vegetation of the human body is found to exist between the Caucasian race and the Austral negroes. This race seems to be purest in Van Diemen's Land and in New Guinea, the inhabitants of the continent and of the other islands having probably been crossed by some other race, perhaps the Malay.

The Austral negroes may be considered as still living in the lowest state of civilization. Cannibalism is common among them, and they do not deny it: they have neither habits, nor do they wear raiment, at least not the men; the women commonly wrap themselves up in a species of cloak made of opossum skin, or in a blanket. Wherever they intend to pass the night they kindle a fire and place a slip of bark or a bough to windward for shelter. The stores of bark and branches of wood to be attributed to their being continually on the move in search of food; for in some places along the coast, where fish and oysters are so abundant as to afford them a constant supply of fish for the table, their fish are dried up.

They have no chiefs, either elected or hereditary, and the authority of a man depends on his personal strength, and his cunning. They believe in a good spirit, Ekepa, and in a bad one, Potepe. The former is thought to watch over and protect them from the operations of the latter, and to assist them in recovering strayed children, which the other is supposed to destroy for the purpose of devouring them. They are very credulous in forest stories: they devours grubs, snakes, stinking whales, and even vegetables, with eagerness.

They are lively, good-humoured, inquisitive, and intelligent, and have the knowledge of reading and writing almost as speedily as Europeans, as they are too plucky to be subdued and extremely acute, and they possess great powers of mimicry. Their number is not great, and it was thought that the interior was uninhabited, but Captain Sturt found them in great places, and on the banks of the Murray more numerous than anywhere else.

V. Division and Settlements.—The northern and western coasts are commonly comprehended under the name of New Holland, which was given to them by the Dutch after a voyage in search of the passage to the South Sea. The northern coast is sometimes designated the Sassafras coast.
northern coast are Carpentaria, round the gulf of the same name, Arnhem’s Land, Van Diemen’s Land, De Witt’s Land, the large and almost uninhabited islands of Port and King George’s Sound, on the south-western coast, and Leewin’s Land. One half of the southern coast is called Nuyt’s Land; after this follow Flinders’ Land, Baudin’s Land, Grant’s Land, and Bass’s Land; the eastern coast, which properly should be called Cook’s Land, bears the name of New South Wales.

The English are the only nation who have founded settlements on the continent of Australia. The colony of Botany Bay, or Sydney, is in a flourishing state, but the others have not yet firmly taken root. Settlements are made on the eastern coast of the Australian continent, but only on Port and King George’s Sound, on the south-western coast, and at Swan River, in Edel’s Land, and on the northern at Melville Island, opposite Van Diemen’s Bay. A new colony is to be formed, however, in Flinders’ Land, at Spencer’s Gulf, on the southern coast, between King George’s Sound and Western Port. (See these articles.)

The last-mentioned colony has received the grant of an immense territory, which extends along the coast from Fowler’s Bay on the west, to beyond Cape Northumberland, or from 132° to 141° E. long., and comprises Flinders’ Land and Baudin’s Land. Towards the north, the boundary is to extend to the Tropic of Capricorn. A very small extent of it about Spencer’s Gulf, that of St. Vincent, and on the Murray River to the border of the territory of New South Wales, are reserved for the use of the colony.

The colony of Van Diemen’s Land appears to be in a flourishing condition. (See Van Diemen’s Land Almanac for 1833, and Tasmania, under which more appropriate name the island is now designated.)

AUSTRALIA, BOTANY OF. There is no part of the world the vegetation of which is so unlike that of all other countries as the middle and southern parts of New Holland. The plants, like the animals, are, to a very considerable extent, peculiar or peculiar in organization, that a large portion of the genera, and some entire natural orders, are absolutely unknown beyond its shores or dependent islands. So different are they of the commonest plants, that Burman, a Dutch botanist, of the school of Linnaeus, actually declared that the species of fern and fern-tree there are with the leaves twisted constantly out of their ordinary position, and with their functions inverted (Evolutia), or with transformed and dilated leaf-stalks performing the office of leaves (Aquatica), and this so commonly, that, according to the computation of Dr. Brown, if taken together, and considered with respect to the mass of vegetable matter they contain, calculated from the size as well as number of the individuals, they are perhaps nearly equal to the whole extent of that country.

Considering how imperfectly the vegetation of this remarkable continent has been examined, that of its shores or maritime districts being the only part regarding which we possess any information, and as little has been published concerning that portion of its flora which has been collected, we cannot be expected to give more than a sketch of the general relation of its plants to those of other countries, together with notices of a few of the most curious and characteristic of its vegetable productions.

Perhaps the best method of explaining the nature of the peculiar vegetation of New Holland will be by offering, in the first place, a general view of the characteristic forms of the flora within the colony of Port Jackson, and to the southward of it, including Van Diemen’s Land; and by afterwards explaining how it alters in character as it approaches the north, till it finally melts into that of the Malayan archipelago.

In the southern parts of Australia we find the concentration of all those curious forms of vegetation for which the country is so remarkable. Forests, consisting of many species of gigantic Eucalyptus, by the settled called trees, many of which are a hundred and fifty feet high, with a girth of from twenty five to forty feet, among which are intermingled wattle-trees (Acacias), with their countless mantles of yellow turfed flowers and bean-like pods; wild fowl of various kinds; and fringes of beautiful islanders (Sericatia chrysocephala), blue pigeons, and swamp pheasants (Carpodetus Pluvialis); and in some places numerous Sympotphae palms constitute the wooded part of the country. In shaded places near Port Jackson, the Coryne austrodes cormophytes its umbrageous leaves, heavily contrasting with the light and delicate many-petalled flowers of occasional tree-ferns. Nettles of an ariocarps habit, from fifteen to twenty feet high, are not uncommon, to which may be added multitudes of proteaceous plants, with their hard and woody stems, often graced with a most showy, graceful, or tall, and slenderness of leaf. A few of them contribute to produce the first sensation of surprise in a stranger who explores the uncleared country. But it is among the plants a smaller growth and a less conspicuous appearance that the botanist recognises the greatest number of new and strictly peculiar species. Many of the most beautiful flowering plants are all of a structure with which he is acquainted elsewhere: in place of the heaths and the geraniums, the ixias, and other iridescent plants, the fig-marigolds, and of the purple tetramerae, polygamous species of the dilatia tribe, looking like shrubby buttercups, and vast numbers of low and brown, flowered decandrous papilionaceous bushes. The orchids of the Cape and of the southern districts of South America are represented by totally different genera, having, however, a more decided resemblance to those of the latter than to any other country. Their floral parts are unknown, although the order exists in abundance in the form of the exclusively Australian genera, pheblum, bocora, alata, corvus, and rivotanemum, which give a striking appearance to many of the plants. In short, too, of the land are often not less peculiar: many of the southern floriferous plants are remarkable objects, especially the beautiful dioscyus corniculatus; while Goodenovia, a curious tribe nearly related to Lobelias, and Strepis, more singular in a vast number of facts with a set of plants which the botanist finds so very much more abundant in that country.

To the southward it changes but little to the region of the ordinary observer, although the naturalist may discern signs of an approach to a colder than European climate in the buttercups, anemones, and polyanthus, that appear in the cold districts of Van Diemen’s Land, the acacias and other versatile plants become uncommon, casuarinas gradually disappear, palms shrink before the cold blast from the southern pole and migrate northwards; and but a single species of tree-fern extends its territory to Van Diemen’s Land. The celery-topped pine (Podocarpus axelodetus), whose leaves taste as well as look like those of the plant from which it derives its name; and some species of callitris, form trees of remarkable appearance, rising on the sides of the mountains to the height of 4000 feet, and growing from 50 to 70 feet high.

Towards the westward the same general characteristics of the country, varied chiefly by soil, mountains, or other circumstances, still continue to exist. The shores of the procontiour of Cape Jervis are bordered with mangrove groves, and the mountainous land at the back of the coast line is covered with trees of more than ordinary size: on the very brow of Mount Lofty, at 2400 feet above the level of the sea, the trees have been measured of forty-three feet circumference. The vegetation of the neighbouring districts is said, however, to be of a far less luxuriant description, the country separating St. Vincent from Spencer’s Gulf, and the magnificent roadstead of Port Lincoln itself, being extremely arid, and being gradually extending, on account of its great number of salt-water swamps. Captain Bather, indeed, gives a much more favourable description of the country in this division of the continent, but the quality of the soil has not yet been satisfactorily ascertained.

About King George’s Sound, the extreme south-western
portion of the continent, the general appearance of the country, although of a barren nature, is very picturesque. The hills are strewn with a profusion of beautiful shrubs, flourishing among immense blocks of granite; Banksias, one of which is called by the colonists wild honeysuckle, are of extraordinary beauty; grass-trees are abundant; and the forests consist of swamp oaks (Casuarina) and gum trees (Eucalyptus), the timber of which is, however, usually decayed at the heart. No grass fit for pasture grows on the plains, which are overrun with a coarse herbage. Culinary vegetables, in the form of a kind of parsley (Aiptos pro-

A remarkable species of Xanthorrhoea, a Zamia with a stem, sometimes thirty feet high, many individuals of the genus Casuarina remarkable for their long, weeping, thread-like branches, and some of the pine tribe, belonging to the genus Callitris, and resembling the Norfolk Island pine in character, give a peculiar character to the landscape. Kangaroo-grass is said to form here, as at Port Jackson, a rich and luxuriant herbage; Banksias, which at King George's Sound are only small trees, here assume extraordinary dimensions, one of them (B. grandis) occurring 50 feet high, and more than 2 feet in diameter. A noble species of gum tree (Eucalyptus calophylla) forms a beautiful object in the scenery. The latter, and several other species of the same genus, here, as in so many other parts of Australia, form the common timber of the country. Magnificent melaleuca with scarlet flowers abound, together with leptospermum resembling weeping willows, and fragrant species of metrosideros, all cut off from the river by a belt of measles of great height and thickness. The island of Bunche is overrun with immense thickets of a solutum, ten feet high, and multitudes of arboreal species of metrosideros.

It is especially deserving of mention that in this part of the continent the vegetation of the singular plants called by botanists proteaceous, while it retains its own peculiar Aus-
talian features, yet presents a greater resemblance to the corresponding part of the flora of South Africa than that of the east side, among which a perceptible tendency to the South American forms exists, according to the observations of Dr. Brown.

Turning from this side of the continent, and resuming the consideration of the flora of the eastern coast, we find that as we approach the colony of Port Jackson, the appearance of the plants gradually changes. But a little to the northward a variety of differences are observable; the little billardierias all disappear, the arau-
caria pine begins to meet the view in Norfolk Island, and becomes plentiful within the influence of the sea air; the singular genus Pandanus, which looks like a pine-apple

[A. Gum Tree (King's Australia).—B. Xanthorrhoea.]}

(A. Gum Tree (King's Australia).—B. Xanthorrhoea.)

[B. Xanthorrhoea.] growing on a palm trunk, bears its slender stem among the woodland scenery; the blue gum-trees (Eucalyptus perriniana) acquire stupendous dimensions; and a singular proteaceous plant resembling Knightia australis appears as a common timber tree.

Near Moreton Bay the tops of the mountains are covered with a vegetation similar to that which is common at Port Jackson, the difference in latitude and the approach to the equator being, as usual, compensated by elevation of surface. In the low lands, the forests abound in a gigantic nettle, and in the valuable chestnut beard (Casuarina superba), whose seeds, when roasted, afford a wholesome instrument to the natures. Here also, in the forests near Brisbane Town, Mr. Fraser observed several species of trees upward of 150 feet high, inclosing immense iron bark trees (Eucalyptus regnans), on which originally the seeds of those fig trees had been deposited by birds. Here they were immediately vegetated, and thrown out their parasitical and rampant roots, which adhering close to the bark of the iron-tree, had followed the course of its stem downwards to the earth, where once armed their progress of growth to truly astonishing. The roots of the fig trees increase rapidly in number, envelop the iron bark, and send out at the same time such gigantic branches, that it is not unusual to see the original tree at a height of 70 or 80 feet, peeping through the fig as if itself were the parasite on the real tree. In the singular angles or scuts, as they are termed, which are formed by the roots of these trees, and
A U S

of which many are sixteen feet high, there is room enough
to do half a dozen persons." (See Hooker’s Botanical
Museum, vol. i. p. 241.) Native cherries (Eucarpos
cupressiformis) abound, Opolea domes the weeping
willow and Horsetail trees. A species of Araucaria, and
a large number of magnifcent trees. The beach is
in some places ornamented with Hibiscus tiiliaceus,
and native bread-fruit (Pandanus pedunculata); in oth-
er places it is thickly clothed with mangroves.

Approaching towards the north, the Araucaria still
continues common; palms increase in number; a pataan (Cin-
clusia) is most abundant in a drum tract thickly wooded
between 15° and 17° S.; and a most extraordinary
caper tree, with the dumpy and enormous form of the
Baobab of Senegal, forms a striking feature. At last, on
its northern shore, the southern and Malayan
varieties are blended; species of sida and hibiscus,
which were rare in the south, become common; and Bank-
swort, the most Australian of Australian plants, disappears;

Eucalyptus indeed remains, and a melaleuca or two, like the
creeper of the east coast, composed of a species of
Malayan forms almost overpower the effect that the former
produces upon the eye. Cabbage palms (Livistona inermis),
but too small to be of use as a fresh vegetable, are
abundant; plants alike to the gumme and sandal wood are
not uncommon; and Casuarina and Pandanus contribute
to confound the Australian character of the vegetation
with that of the Indian Archipelago.

It is a common observation, that New Holland does not
possess any species of the exotie fruits thrive exceedingly in
the genial climate of many parts. This remark is very nearly correct; for it is
true that, with the exception of the Australian cranberry
(Li...the species...and a few berries of scarcely any importance,
the country is, as far as has yet been seen, entirely

R E S E A R C H

A U S

deed been detected in it; but this in itself affords little
information, since even with reference only to European
rocks, this genus is found, from the grauwacke to the
lia inclusive. The coal and associated bed of sandstone
with which they are interbedded, are for the most part
from Port Stevens to Botany Bay, occasionally ranging
into the interior, have been considered equivalent to the coal-
measures of Europe, merely from their mineralogical
characters. The following rocks (of the same nature as
above) are, we have no means of accurately judging; but it is
worthy of remark, that a fossil plant (Glossopteris Brown-
tana) detected in it is also discovered in the Damuda coal
district in India. The coal itself appears to be abundant,
and generally to a high quality, and it is estimated that
four thousand tons of it are annually raised at the
Newcastle mine, producing 4000s. at Sydney. As iron ore
appears to be also abundant on the same line of coast, we
may reasonably conjecture that the western side of Australia may be studied with iron foundations, distributing
their products over southern Asia, and among the numerous
islands of the Indian and Pacific Oceans.

Trappe rocks, varying as usual in their mineralogical
structure, appear to be common in various parts of Australia,
but their relative antiquity and their general mode of occurrence
are alike unknown to us. The Mittagong range, to the
S.W. of Sydney, is stated to be composed of these rocks,
and is considered to rise to a height of 800 feet. Sandstones of the district in a manner which might lead us to suppose that it had been protruded through them.

Mr. Sturt, in his passage down the Murray, crossed a
considerable extent of country occupied by a fossiliferous
formation which Mr. Goudie describes as that of the

estimates the thickness of this deposit to be considerable,
and that it rises to the height of about 300 feet. He has
noticed and figured many of its organic contents (see Sturt’s
Two Expeditions the Interior of Southern Australia),
whence he infers its vast extent in the tertiary cy
Be this as it may, an immense mass of marine shells has
probably been accumulated at an epoch long subsequent to
those of the limestones and coal deposits previously noticed.

The present character of the country appears to be

wards taken place, by which the highest part of the deposit
is now raised 300 feet above the sea. As yet no other rock
apparently of the same date has been noticed in Australia.

The fact which in the order of geological events next
claims our attention, is the occurrence of the bones of many
numerous animals in cliffs and caves, in the same manner
as those observable in the casierous caverns and cliffs of
Europe. The caves and fissures are in the limestone dis-

australia, geology of.

We possess so few facts respecting the geographical structure of Australia beyond an enumeration of a limited number of localities in
which granite, limestones, sandstones, and other rocks, belonging only by their mineralogical characters, occur, that to attempt even general comparisons with the known European deposits would be entirely useless. The mere occurrence of granite at any given place afforded in itself no
information as to its relative antiquity, since this rock,
consisting of a great variety of species, is of the same kind wherever it may be observed to be referable to several epochs, as is the
case with the European granites. From the desire to consider
all rocks in different countries as equivalent to some one or
other of the European deposits, the red sandstones which
occurred near Cambridge has at Yarramunda, and in other
places on the northern coast, which are found at St. Vin-
cent’s Gulf on the southern coast, and which occur at Ya-
was Plains and other situations in the interior, have been called
red sandstones. In this connection, it is only necessary to observe, that the remarkable marsupial animals, which are thickly interspersed in these deposits, are confined to Australia, and have been found in the
inhabitants of that part of our planet from a period which may perhaps be considered equivalent to the existence of elephants, or the same period, if not, in the British
islands. We may, perhaps, further infer, that since that
period there have been no movements in the solid crust of our globe, or that part of it which should permit any land to form a communication between Asia and Australia, and thus admit the passage of animals from one continent to the other. The elephant has ceased to exist, and its place has been supplied by a bear; and, on the other hand, the kangaroo and that tribe of creatures have not roamed into Asia.

It only remains for us to notice some considerable and apparently recent accumulations of sands, principally composed of the abodes of the sea, in parts of the coasts of Australia. They have been found in the gulf of Carpentaria, but are particularly remarkable on the western coast, especially in the vicinity of the new settlement of the Swan River. They are distinguished by concretions which appear to be formed from vegetable substances that have for the most part disappeared. Archdeacon Scott (Proe. of the Geological Society of London) states that, to the east of the intended town of Fremantle, 'the sand of assumes the character of a thick forest, cut down about two or three feet from the surface, so that to walk on it becomes extremely difficult, and even dangerous.' Much light is thrown on this kind of deposit by the observations of Dr. Clarke Abel, on a bank rising one hundred feet above the sea, at the Cape of Good Hope; for he detected the accumulation of sand round Aces, the calcareous matter producing a cement, which retained the other particles of sand together after the decomposition of the plant. This would also appear to have been the case in the Australian situation, according to Archdeacon Scott, attains a height of 300 feet above the sea at Mount Eliza, ten miles from the mouth of the Swan River. It is there based on red sandstones, which appears to be associated with red marl and quartzite. It is concluded to be the remains of the mountains of Darling's Range, among the argillaceous slates of which roofing slate has been detected.

The mineral riches of Australia have been little explored. Iron and coal are, as above noted, abundant; copper is stated to have been found in Cumberland, and coal and lead are also said to have been discovered. Large tracts of limestone occur on the eastern side; limestones which are capable of being worked for ornamental purposes; clays suited for the economical purposes of life are common, even in the vicinity of Sydney, where there are numerous sandstones which seem well adapted for ornamental buildings; gypsum is found abundantly both in the clay or marl extending from Bathurst to Hunter's River, and in the vicinity of the Swan River; and there is roofing slate both in the eastern and western parts of Australia.

AUSTRALIA, ZOOLOGY. In treating of the zoology of Asia and America, occasional allusion was made to the influence which the natural productions, animal as well as vegetable, of these two regions, of less extensive range, and less elevated, and therefore the earlier civilisation of their aboriginal inhabitants. We are not aware, indeed, that this influence has been properly appreciated by those who have investigated the origin and progress of human society; if perceived at all, it has been, perhaps, in so far as to lead to a reasonable consideration will convince us that it is in reality one of the circumstances which bears the most intimate relation to this important subject, and that it consequently merits the most serious attention, not of the professed zoologist alone, but more especially of the philosopher and the historian. Whatever was the original condition of mankind, it is manifest that the geographical distribution of animals, their abundance or scarcity in particular situations, their peculiarities in being adapted to the wants of other domestic purposes, must necessarily have had the most intimate connection with the original condition of our own species, and with all the earliest steps towards civilisation. Asia and Africa abound in numerous species of large gnarvus quadrupeds and gallinaceous fowls, which not only furnish human food of the best quality and in the greatest abundance, but are likewise most easily captured: many supply both food and materials for dress. The traveller is struck by the natives of Asia, which man has been enabled to domesticate and to render the instruments of his further progress in civilisation. But, in situations less favourable, where animals were rare, and of species not so well adapted for human food and clothing, as, for instance, in the north of Australia, man had to contend with numerous and, in some cases, insurmountable difficulties, which were altogether unknown to the more favoured inhabitants of the Old World. Incessantly occupied in the primary and indispensable labour of procuring a scanty and precarious subsistence, badly protected by insufficient covering from the effects of the weather, and subject at all times to frequent and long-continued fasts, he possessed neither the means of supporting a large family, nor the means of improving his condition by the development of his natural faculties. Under such circumstances it was impossible for any considerable progress to be made in the arts of civilised life; the females also of the American and Australian savages are notoriously less prolific than the women of these civilised continents; and the aboriginal population of those countries, in relation to their extent, is extremely scanty in comparison with that of Europe, Asia, or even Africa. Hence it is not improbable, in a great degree, that the inhabitants of the New World were found to be so far behind those of the Old in point of civilisation and social improvement; or if this general rule finds an exception in the case of the ancient nations of Mexico and Peru, it is a rare and partial instance, and appears to depend upon local and peculiar circumstances.

These reflections will prepare us for forming a just estimate of some of the causes which appear to have operated in preventing the improvement of the Australian savage. When applied to the physical circumstances of his country, and more particularly to the peculiarities of Australian zoology, as exhibited in the following table, they will enable us not only to appreciate some of the reasons of his condition, but also to perceive the actual causes which prevent the increase of the species.

ORDER.

| Whole No. of known | No. of species | Proportion.
|-------------------|---------------|-------------

Total 1846

The first observation which we have to make upon the mammalogy of Australia, as exhibited in this table, is the very small number of species which inhabit this continent when compared with the actual extent of the country, of the whole of which many parts are barren and uninhabited. The disproportion will be rendered still more striking, if we deduct from the total number 75, the 22 species of marine mammals, viz., 13 cetacea and 9 seals (phocae), which are included in the table. We thus find that the mammalia and birds of Australia amount to no more than 53 different species, forming scarcely the one twenty-fourth part of the whole number of known quadrupeds; a very limited proportion indeed when compared with the relative size of the country.

Nur is the small number of distinct species the only peculiarity which is observable in regard to the number of mammals which inhabit this country; the scarcity of individuals is quite as remarkable as that of species; and the traveller in this country will frequently journey for weeks together, and pass over many hundreds of miles of country without meeting with a single quadruped. The cause of this peculiarity is to be sought for in the physical conformation of the animals themselves, rather than in the peculiarity of the country: the few species of them by the natives, for, as may be observed from the table, the great majority of Australian mammals belong to the Marsupial order, of which the species are less prolific, and the traveller will find those animals to arrive at maturity, than those of any other group of quadrupeds. It will be readily perceived that these two circumstances, the paucity of distinct species, and the scarcity of individuals in the several species among the mammals of Australia, must have presented, at all events, a formidable barrier to the increase of population and the advancement of civilised society in the part of the world.

The second peculiarity in the mammalogy of Australia, so that after abstracting, as before, the 22 marine species from
The number included in the table, viz. the 19 Carnivora and their allies comprised among the Carnivora, will be found to be the result of the exclusion of all species of the sub-class Macropodamygdalina, peculiar to that continent; or, in other words, that there is not a single Australian species common to that and any other part of the known world. This is a very singular circumstance, and one well worthy of mention, as it will assist in finding ample scope for conjecture in so curious and unique a phenomenon.

But there is a third observation which we have to make upon the geographical distribution of quadrupeds as indications of the habits of tribes. As we have seen, there are the least with very few exceptions, all the quadrupeds of Australia, at least all the terrestrial species, belong to the Marsupial order. Thus if, as before, we subtract the 29 marsupial species from the total number of Australian mammals, we have only 240, or less than 240, or about four-fifths of the entire amount, belonging to this tribe; and the circumstance is rendered still more singular by the consideration that very few animals of this order exist in any other part of the world, the few extra-Australian species being, with the single exception of the common oppossum (Didelphys virginiana), which inhabits the southern provinces of the United States, confined to the tropical parts of South America, and to the larger islands of the Pacific. The only other species of this tribe is the extraordinarily anomalous, the northern coast of New Holland. Australia these are the head-quarters of this extraordinary and anomalous tribe; a race which seems almost all the distinguishing attributes of every other tribe of quadrupeds with the crows, the penguins, the whales, the seals, and the fur seals, and the best-informed Mammologist who could be consulted, is of opinion that the marsupial tribe is a separate one; and one or two of the marsupial tribes is more properly discussed under the article Marsupials, to which we refer.

The last observation which we must make in the present view of the geographical table, is that the country is entirely destitute of both pachydermatic and ruminating animals—that is, of all those species which are best adapted for human food and for the various purposes of social economy. It will be readily admitted that the entire wild life of the country which has already been made upon the connection between the geographical distribution of animals, especially those which are most applicable to the purposes of human life, and the civilization of mankind, that this circumstance must have at all times exerted a powerful influence over the social condition of the aboriginal inhabitants of Australia; and that it readily explains, not the thinness of population which exists in this extensive country, but likewise the abject and degraded condition to which its savages are, by nature, and generally found. A precarious supply of fish, shell-fish, and roots, supplies the chief part of their subsistence; many have been observed greedily devouring the most disgusting reptiles, worms, and caterpillars; land animals, as well as the birds which even the savage notices his country, and even when met with, difficult to obtain; a kangaroo was occasionally surprised, or run down by dogs as wild and savage as their masters, but the small arboreal phascolargias and pristamias could only be obtained by burning our cuttings down the trees in which they were discovered.

The natives had no contrivance to shoot or ensare birds, nor could they capture the dolphins and seals which abound on their coasts, like the Esquimaux and Greenlanders. Under these circumstances, it is extremely probable that the native Australian could have ever emerged, by any possible exertions of his own, from the savage condition in which he was found by his European discoverers.

We now proceed to a more particular consideration of Australia. Almost as well as any other country, this extensive country is entirely destitute of quadrumanous animals, such as monkeys and lemurs, as well as of pachydermatic and ruminating animals. The chiropters, or winged quadrupeds, consist, as at present known, of but two species, one of which is rare and migrates, according to the season; the other, a small bat, not unlike the species so common in our own country. It was the former of these animals which so greatly frightened the two companions of the Beagle's voyage, who, when they were returned trembling from a short excursion on shore, declared that he had met the devil creeping slowly through the grass, but that his terror prevented him from making any other observation than that he had long horns, and was about the size of a nine-gallon keg. This species probably visits the lakes of the Indian Archipelago; like all the frugivorous beta, its flesh is white and tender, and is said to resemble chicken.

Of the order Carnivora, ten species are inserted in the table as inhabitants of Australia; five peculiar to that continent, and five common to it and other countries. Of these ten, however, nine are marine mammals, belonging to the seal genus (Phoca), and comprehending the sea lion, sea beaver, and other animals of the same tribe. The one remaining animal of this order is the dog, a variety of intermediate size, with prick ears and a wolfish appearance, which is found both wild and in a semi-domestic state among the natives. It is not known, unquestionably the most widely-spreading domestic animals after the dog, had been familiar with this latter animal from time immemorial; and indeed, by all appearances, it seems to be the first inhabitant of the forest which was reclaimed and mastered by mankind. Once domesticated, it may be readily conceived that the dog would ever after remain the inseparable friend and companion of man; and hence it is that they are found together in all the different groups of islands scattered through the Pacific Ocean, for instance, where no game exists, and where, consequently, he can be no longer turned to the pure nature of a wild beast for his sustenance. On the contrary, he is still found, though under widely different circumstances, being regularly fatted for the knife, and considered as a dainty reserved only for the tables of the chieft and great men. Its size and beauty, the texture of its fur, the form of its body, which is long, lean, and sharp, the peculiarities of its voice, comprehends the great majority of Australian mammals, and forms the principal character of the zoology of this part of the world. The forty-three species of this tribe marked in the table belong to eight natural genera, which are well defined and well marked, and which conform to the premature production and subsequent nutrition of the young in a pouch or bag with which nature has provided the female parents, and from which the order derives its name of Marsupialia, but differing widely in all the other peculiarities which have given it so peculiar a name. The marsupial order has been divided into six small families, and the peculiar distinctions have not been very clearly determined even by zoologists. Among the larger species, the common kangaroo, called the 'forester,' and the 'old man' in New South Wales (M. labius), the red and woolly kangaroos large (M. rufus) and smaller (M. rufus), and still larger, and the woolly and brown, with the brown and black, and the brown and white, and the grey and brown, all extend from New South Wales to Van Diemen's Land, at least the same local names are applied to animals inhabiting both these colonies, but they have never been sufficiently compared, nor is the identity of the species established upon any better grounds than that of the names applied to them in these two localities.

The potorous, or kangaroo-rats (Hyperphryneus), are very
The bandicoots (Perameles) compose a very remarkable genus which does not admit of a ready comparison with any other. They are a group of animals likely to appeal to the curiosity of readers. With a dental system and even an outward form which very much assimilate them to the larger shrews and other insectivorous mammals, they unite the habits and appearance of the ordinary carnivorous quadrupeds, but apparently live exclusively upon roots and other vegetable substances. Their habits are similar to those of the kangaroo-rats, excepting that they do not hop upon the hind legs only, but use all the four extremities in the act of progression, like ordinary burrowing animals. The form becomes visible only during the daytime in natural crevices, or under fallen timber, more about only during the night-time, and are not considered fit for human food. Two species only have been described, P. australis, and P. obsoleta, both found within the colony of New South Wales.

Two other genera of Australian mammals, the dasyures, (Dasyurus), and thyylacynas (Thylacynus), partake of the habits and appearance of the ordinary carnivorous quadrupeds, and appear to unite this tribe of animals with the marsupials in general. The first of these genera, called Dasyurus (i.e., hairy-tails), to distinguish them from the naked-tailed opossums of America, with which many naturalists had previously confounded them, is a large genus, generally of small size, and agreeably marked with various white spots on a black, olive, or russet ground. Their habits and mode of life generally resemble those of the martins and polecats of Europe; they are nocturnal, browse and feed about five for a week, on roots, buds, and small prey. Six or seven species have been described. The turbine dasyure (D. setosus), or native devil, as it is called by the colonists, is perhaps the ugliest and most disgusting looking quadruped in nature. It walks very short, its body thick and heavy, and its head and legs large and disproportioned to its other dimensions. It inhabits the coast of Van Diemen's Land, sleeping during the day-time in holes among the rocks, and moving abroad during the night in quest of dead seals and other marine productions which compose its food. The D. macrourus, D. riverrumus, and D. mansehen, are found in Van Diemen's Land as well as on the continent of Australia, and are sometimes called native cats by the colonists, not from any close resemblance which they bear to cats, but from some slight similarity in their habits, as they climb trees readily in pursuit of small birds, and capture their prey more by address than by open force. The D. penicillata, called the sugar squirrel by the colonists, a name which is also sometimes applied to the petasurus scuratus, is about the size of a common cat, of a uniform ash light colour, and has the tail terminated by a pencil of long black hair. It roams entirely among the branches of trees, chiefly of the myrtaceous order, and in all probability never leaves its name, and appears to live for the most part upon the larger night insects, and probably upon the eggs and young of small birds. The smallest known species is the D. penicillata, a small marsupial, or mouse dog, of the colonists, which is not larger than the little animal with which it has been referred to it, and which, like the sugar squirrel, resides upon trees, and lives principally if not entirely upon insects.

The habitat of the thylacynas contains but a single known species, Thylacynus carnifex, and that apparently confided to Van Diemen's Land. It is about as large as a moderate sized dog, and not unlike the canine species in general form and appearance, except that it is longer in the body and has shorter legs. Its colour is a uniform reddish brown marked across the back with a black stripe, and seen on the legs or sides, a very regularly arranged, and terminating singly upon the sides. Like the generality of marsupial animals, it is nocturnal in its habits, generally keeping concealed on the land and under cover, coming forth at night in search of prey, and often committing depredations among the lambs of the colonists of Van Diemen's Land, as the dasyures do in the poultry-yards of New South Wales. For this reason the thylacine is keenly hunted by the colonists, and its vast distance from the nearest settlement does not prevent its being a cowardly animal, and easily wounded by a courageous dog.

Of the five species of Rodentia included in the tabular distribution of Australian mammals, those belonging to the genus Allocotis and in the family of the Hylomyminae, are the only two compose the genus Allocotis. The former are but little different from the common species of rats and mice in other parts of the world.
the latter are merely distinguished by their larger size, long, bony tails, and palmed hind feet, which assimilate them in some measure to the beavers and coypus of America. They are aquatic in their habits, and are found in most of the rivers both of Van Diemen's Land and New South Wales.

The two Edentata, inserted in the table, belong equally if not more properly to the marsupial order, partaking, indeed, of the characters of both of these tribes, and forming the connecting link by which they are united. These animals are of a very curious kind, the males of some of them being quadrupeds that have ever been discovered. Though they are certainly quadrupeds in the great majority of their characters, yet their organs of mastication more nearly resemble the bills of birds than the corresponding parts of other mammals. The female of this tribe is not the same as the male; they are true mammals, and nourish their young by a milk secretion like all other animals of the same class, yet it is still a matter of keen dispute among naturalists and physiologists whether they produce their young alive, or lay eggs and hatch them like birds, or rather perhaps like reptiles, for the whole detail of their organization seems to point them out as intermediate between this class and the ordinary mammals, rather than between mammals and birds. Many native names are given to these animals, in the Ormthorhychus and Echidna. The former, often called the duck-billed animal, from the form of its head and face, resides in rivers and ponds, where in fact, like ducks, it lives principally by searching for seeds and insects among the vegetation of the banks. For this purpose it is armed with a complicated and delicate tissue of nerves, which enables it to distinguish its food from the small mud and gravel with which it is mixed, and it is induced by small grains along the sides so as to permit it to strain off the mud. It is also, at the same time, forms deep burrows along the banks of the rivers, which are provided with two entrances, one above and the other below the level of the stream, so as to afford it a refuge from the force of the current, and is lined with it in the same way. Some naturalists reckon two species of Ormthorhynchus, the O. rufus, and O. fuscus; others consider them both as varieties of the same species, to which they give the name of O. paradoxus. The genus Echidna, thought to agree in its general structure, and in the very anomalous nature of its production with the orphantorhynchus, yet differs widely from that animal in its external appearance, as also in its habits and economy. It is covered with short, soft prickles not unlike those of a porcupine, feeds upon insects and small animals, and bears its young live. The males, both in the male and female quarters, are reared by the females, with deep burrows of its own formation, and hibernates or sleeps during the winter season. Of this genus there are two species, one without and the other with spines; these species form very important items in the annual colonial exports.

The ornithology of Australia, though far from being so peculiar and anomalous as its mammalogy, contains, nevertheless, many new and singular forms, and wants many of the names. It is one of the parts of which we are most in want of information, and the speculation has been a most important accession to the general resources and prosperity of the colonies. The seal fishery has also been attended with considerable success, and some of these forms form very important items in the annual colonial exports.

The coast of Australia has been long known as the occasional resort of immense shoals of whales, dolphins, and other cetaceous animals, and the enterprising parts of the racings established in that quarter of the globe has found a favourable and successful outlet in the fishery for these animals. Many vessels are now annually fitted out from Sydney and Hobart's Town for this valuable branch of commerce, and the success with which they have attended the speculation has been a most important accession to the general resources and prosperity of the colonies. The seal fishery has also been attended with considerable success, and some of these forms form very important items in the annual colonial exports.

The ornithology of Australia, though far from being so peculiar and anomalous as its mammalogy, contains, nevertheless, many new and singular forms, and wants many of the names. It is one of the parts of which we are most in want of information. The presence of alarming species of hawks abound everywhere, as well as owls of different kinds. The common peregrine falcon (Falco peregrinus), and the barn-owl of Europe (Tyto alba) are seen with more frequency than in the same species in England. There are, however, no vultures throughout the whole extent of Australia and its dependencies, a fact probably to be explained by the absence of large carnivorous animals, upon the existence of which this species have been dependent, and which, as we have already seen, are wanting in the animals of Australia. Insectivorous or perching birds are extremely numerous every where, but not sufficiently remarkable to require a detailed enumeration. Among the Scansorial order, there exists a vast variety of the parrot tribe, comprising, among others, many beautiful species of pigeons and cockatoos, which surpass those of the Old World in the variety and ornament of their plumage. These birds are held in great detestation by the natives, of whose furtive incursions upon the fields of Indian corn and other agricultural produce their loud and incessant screaming gives notice, and among which they are consequently considered to be in league with the devil, the black and white colour of both the confederates furnishes an unanswerable argument in the logic of these simple savages for the truth of this foolish belief. But the most remarkable fact in the ornithology of this country is the total absence of gallinaceous birds. This is the tribe which among birds corresponds with the ruminating animals among quadrupeds, and which contains those species which are best adapted for human food and the domestic economy of life. We have already seen that the analogious tribe of mammals is a stranger to this part of the world, and here again we find that it is equally deprived of the common fowl, pheasants, turkeys, guinea-hens, &c. which form no unimportant resource for the aborigine in addition to the common game, which in farm-yards and filled the preserves of civilized nations. Doves and pigeons of various species indeed abound in many parts of New Holland, and the menura (menura superba) approaches still more nearly to the ordinary gallinaceous birds by its habits, but it is of too inaccessible a size to have furnished any peculiar resources to the aborigines. The tribe of birds most important in human economy after the gallinaceous or rousers, are the nartaors, or water-fowl, and of these New Holland and the neighbouring islands offer a bountiful supply. It will be sufficient in this place to mention the cormorant, and the black swan, the 'rara avis' so little dreamt of by the Roman poet, which now breeds spontaneously in England, and is brought in great numbers for the rotation of the curious. It is rather smaller than the common white swan, but with a neck proportionably longer, and a carriage, if possible, still more graceful.

Of the reptiles and fishes of Australia no detailed or regular accounts have yet been published. A species of crocodile or alligator is said to frequent the western coasts of the continent and the shores of New Zealand; and various descriptions of smaller reptiles and snakes, very few of which are venomous, are found in different parts of the country. Freshwater abounds with fish, and five species of sharks have been described as frequenting the neighbourhood of Botany Bay and Port Jackson, but very little is known upon this department of Australian zoology. Nothing has been sufficiently investigated. There is reason, however, to believe that it contains nothing that would entitle it to a very detailed notice in a sketch like the present.

AUSTRIA, EMPIRE OF. Noricum, in remoter ages a wild tract of country, which has the appearance of having once been covered with water, extended from the Julian and Carnic, or Carinthian Alps, to the right bank of the Danube, and from Mount Cetus to the Rhodian borders. From this inconsiderable region, for its area scarcely exceeded that of the present archduchy of Austria itself, sprung the 'Oesterr. k. 'Eastern territory of the Empire,' or 'Western Mark of the Empire of the Franks,' as it was designated by Charlemagne, when towards the close of the eighth century he retook the territory, which had been ceded with great times with the German empire. This once wild and inhospitable region has given birth to a race of rulers who have gradually united kingdoms and principalities under their dominion, which now comprehends nearly one-twelfth of the entire surface of the globe, and which, by the birth of the marzaker Odoacer, by whose hand the last of the Cesar's fell, has become the centre of an empire, which, for diversity of component parts, strongly resembles the once gigantic empire of imperial Rome. Those parts, indeed, are so far more dissimilar than the territories of the same name in other parts of the world, that it is difficult to imagine them as capable of assimilation, and they are separated in language, usages, and prejudices; so far from being united into one nation, they are held together by a solitary link—that of subordination to a common sovereign.

Through the great variations of productions in this empire, as we have observed, nearly one-twelfth of the surface of Europe, they constitute only the third point in point of
extent, among its monarchies; for the European territory of Russia is full eight times, and the Swedish one-twelfth, more extensive. The 'Campania of Germany,' as the Austrian empire has been not inaptly designated, makes a compact dominion, to which its southernmost extensive narrow strip of Danubia, forms only an exception. It lies between 42° and 52° N. lat., and 9° and 27° E. long., occupying an area of 255,926 square geographical miles, the circuit of which has been estimated at 4600 miles. It thus spurs over nine degrees of latitude, and eighteen of longitude, and uses the new configuration given to it by the treaty of Paris, in 1814, and the adjustment made by the Congress of Vienna in the following year, extends from the castle of St. Stephen, thirty miles below Carlsbad, in the north, to the town of the Po, in Upper Italy, to the sources of the Spree, close upon Prussian Livonia, and almost to the walls of Sandomir, in Polish Russia; and from its extreme western point, the hamlet of Engers, at the southern end of the Lake Maggiore in Lombardy, to Kheinsia in Bessarabia, which lies close upon its most eastern border. The territories of Saxony and Prussian Silesia bound the Austrian dominions on the north-east and north, the former for 250 and the latter for near 920 miles next to the territory of the republic of Cracow; and, in the same direction, conjointly with their eastern frontier, the Russian provinces of Polesia, Volhynia, and Bessarabia border them for a distance of near 920 miles, and in it and in the eastern limits of the Austrian dominions are the most vulnerable, as the frontier is entirely open in the north-east for 160 or 190 miles. The remainder of the eastern and larger portion of the southern confines adjoin the Turkish provinces of Moldavia, Wallachia, and Bessarabia, with nearly 1400 miles. The Adrian washes the Austrian shore for 650 miles; the land boundary on the south skirts the dominions of the Roman Sea about 60 miles, of Modena and Parma 120, and of the Sardinian States about 180. The eastern limits of the Austrian dominions, in their course from the south to the north, border for an extent of 330 miles on the Swiss cantons of Ticino, the Valais, and St. Gallen; of 14 on the principality of Liechtenstein; of nearly 200 on Lake Constance; and of 550 and upwards on the kingdom of Bavaria. The extreme length of the Austrian Empire has been estimated at 870, and its greatest breadth at 950 miles.

The territorial surface of the Austrian dominions has been variously stated by the best writers on the subject: for instance, estimates it at 255,926 square geographical miles; Lichtenstein at 253,183; Rohrer at 253,736; Häsler at 257,286; and Blumenbach, whose authority appears to have been followed by Hörschelmann, in his new edition of Kohl's Statistical Geography, at 260,453. In the statement, however, which we are about to give, we have preferred to abide by the dimensions assigned by Rohrer, whose Statistics of the Austrian Empire are generally reputed to have been founded on semi-official documents.

The soil is of endless variety, but in general favoured by a mild and genial climate, and distinguished by remarkable productiveness.

Slavonia and the south-eastern and central parts of Hungary (and we mean in the strictest sense of the term, although the subdivision of this vast monarchy) present a wide expanse of low land, abounding in clay and marl, and of subsoil fertility, yet lying in immediate contact with and, nearly steppe, and extensive marshes, which occupy more than 4000 square miles of the Hungarian plains. The tracts of these steppe however have been, and more are in process of being, reclaimed and brought under cultivation. This very territory, however, in its northern and western districts, is characterized by mountain and forest, and is encompassed in the north by the Carpathian mountains, which extend in a broad semicircle from Pressburg, one of the most westerly points of Hungary, to its eastern confines, and their offsets also strike deep into the interior of the country; in the west, various branches and groups of the Cetian, Styrian, and Julian Alps cover a large portion of
its surface. The lowland of which we have spoken occupies about 25,000 square miles; the larger portion, an area of about 1,000,000 miles, lies between the Danube and the Transylvanian mountains, and is watered by that river and the Tisza for a length of upwards of 500 miles, and interspersed with extensive plains and morasses. The smaller plain in the west, stretching eastward from the Neusiedler Lake, with a breadth of nearly 120 miles beyond Gran, and along each bank of the Danube, comprises an area of upwards of 4,000 square miles, which is remarkable for its fertility.

The general character of the Hungarian soil, exclusive of the more northerly districts and such as are partially a waste of barren sand and swamp, or whose soil is saturated, as in many eastern districts, with saltpetre, is that of great produce, especially in the earlier months of the year. The corn is especially abundant in the environs of Belgrade. In the middle of June, when the harvest begins in the plains, the corn is scarcely seen in the higher regions. The temperature is, on the whole, higher than that of Germany; and though the unwholesome vapours from the marshy bottoms and swamps, taw, properly swamp, may be prejudicial to health in a few quarters, it were unjust to say, as it has been said, of Hungary, that it is the "barren-place of Germany." It abounds in rivers, streams, lakes, and possessed some considerable canals; is richer than most countries on the plains, and is supplied with an abundant mineral and forest produce.

South of Hungary lie the former principalities of Croatia and Slavonia, the larger portion of which are now incorporated in the Austrian empire. In the northwestern quarter, the maritime territory from Fiume to Carlsborg, is intersected by a continuation of the Carinthian chain, to which is owing its alternation of plain and highland, and its variable though generally salubrious climate. Where the Tisza is interrupted by the Sremska Drava, it is productive; in more elevated situations it is a cold clay; and near the coast, marsh and sand abound. Nine-tenths of the surface produce grain, wine, fruit, and tobacco, but, above all, cotton and hemp.

Slavonia, the northern districts of which are separated from Hungary by the Drave and Danube, whilst the southern are watered by the Save, is traversed in its whole length from west to east by mountains and hills: the principal hill is the Srednji Vrh, or Donava, in Croatia, and subsidises not far beyond its eastern limits. The rest of the province has an undulating surface, which gives some variety to its spacious and fruitful plains. With the exception of the swamps that range along the banks of the Save, the usual soil of the province is of the nigroid kind, and its productions are wine, silk, hemp, spirits, fruit, iron, and coal.

Nearly the whole of the western frontier of the arch principality of Transylvania borders on the Hungarian territory, and is only separated from the latter by the Salzach, with a lower course on the Danube. This province surface is at a much greater elevation than the neighbouring territories, and slopes gradually from the north-easterly border of the province to the south-westerly point, where the Morosch discharges its fertilising stream into Hungary. Transylvania is watered by two great rivers, the Tisza and the Drave, but abounds in valleys, some of which are of considerable extent, finely wooded, and inferior to none in Europe for beauty of scenery and fertility. It is full of lakes and natural mineral waters. In the more elevated regions, the climate is raw and cold; but, below them, it is temperate and pure: no part of the province can be termed unhealthy. The highlands being generally covered with forests, timber is the chief Transylvanian produce: gold, silver, iron, and copper are found in the province. In other respects Transylvania is characterized by nearly the same class of productions as Hungary.

North of the Carpathians, which separate Hungary from Galicia, the Galician plains gradually sloping from the mountains till it opens upon the extensive flat, of which a hill or river's bank seldom relieves the monotony, and the distant North Sea and the Baltic form the northern boundaries. Galicia, though it contains many sandy tracts, is, next to Hungary, a principal granary of the Austrian states, and supplies large quantities of salt, some precious metals, and many other mineral and vegetable productions. Its soil is of very varied character; in the west, but more particularly in the vicinity of the San, it is mostly sandy and dry, and far inferior in all respects to the eastern parts of the province, which are watered by the Dunajec and covered with a moist cold loam, and beds of chalk. These beds are intersected with layers of granite, gneiss, and quartz, and here and there rise from the surface into low hills; and the Galician soil is no where so productive as in the districts of Zucnoff and Stanislavow. In climate Galicia differs much from northern temperature, for there are few parts in which the cold influence of the Carpathian atmosphere is not sensibly felt: hence the grape and most other fruits do not generally ripen.

The south-western limits of Galicia adjoin the high mountain regions of Austrian Silesia, a country as poor in grain as it is abundant in pastures and timber, and known, in common with Moravia and Bohemia, for its growth of flax and its linen manufactures.

South-west of Silesia lies Moravia, which, compared with the adjacent regions of Hungary or Bohemia, has a far milder climate; it is mountainous in its eastern, northern, and western districts, but low and open towards the centre and south, the rich olive groves which has been given a land of maize and wine. In this direction it presents a line of rich and finely-cultivated plains; but the remainder of the province, occupying upwards of one-half of its area, is intersected by arms of the Sudetsch and Carpathian ranges, which divide it into three main divisions, viz., namely, fertile valleys. The greater portion of the province is from 600 to 900 feet above the level of the sea.

West of Moravia lies the great 'Cauldron Plain' of Bohemia, bound on every side by the granitic-based chain of the Bohemian mountains, and crossed by two arms of the Moravian, Böhmerwald, and Ore (Erzgebirge) mountains, which send out their offsets into the interior of the country. The heart of this kingdom presents a surface of gentle undulations, studded in many parts with lofty crags, and intersected close upon the verge of the coniferous forest by the great valley of the Elbe. This country lies so high, that it has scarcely a river which does not rise within its own boundary and is derived directly from the springs of the side of Bohemia, and is equidistant from the Baltic and Adriatic, and enjoys a mild, regular, and healthy temperature; but the climate is raw and variable over the larger part of its surface, which is occupied by the highlands and mountains, Bohemia is rich in coal, copper, iron, and manganese; and the arable and otherwise productive lands, although nearly two-thirds of the surface are occupied by woods and forests, extend over four-sevenths of the Bohemian territory.

The Archduchy of Austria consists of two provinces; the 'lower province' is intersected on the confines of Styria by a branch of the Noric Alps, and its centre by one of their smaller arms, the Cetian mountains, whilst the warm and fertile valley of the Danube traverses this and the Tyrolese. The 'higher province,' which forms the western part of the archduchy, is a mountain region, the southern portion of which abounds in the lofty peaks, glaciers, and valleys which distinguish the Noric Alps; the northern contains part of the last mentioned summits of the Bohemian Forest chain or Böhmerwald Gebirge. The 'lower province' is poor as a corn country; but produces much fruit and wine, iron, silver, coal, and lead, and is, in a manufacturing point of view, considered as the Lancashire of Austria. The upper province, which includes the Salzburg territory, and contains, in proportion to its extent, more rivers and lakes than any other district in the empire, has a soil which, in spite of the skill and unceasing industry of its inhabitants, does not yield sufficient produce to support such quantities of fruit, hay, oats, and salt, and produces much iron, and some considerable supplies of gold, silver, lead, copper, and other metals.

Styria, which the Archduchy bounds on the north, is considered almost entirely covered in its northern and western districts, by those majestic arms of the Julian Alps known by the name of the 'Styrian Alps.' The southern and eastern districts contain few lofty heights, and are intersected by gentle hills, the space between which are filled up by broad and well-cultivated valleys. The whole of the province, which seems naturally to divide itself into Upper and Lower Styria, is amply provided with rivers and streams, whose rich pastures, and abundant crops of every kind of grain, of clover, vegetables, fruit, and wines, and the races of horses and cattle. Besides this, no country of the
same extent in Europe is more valuable for its stores of salt, iron, steel, and tin, and its works and manufactures.

West of this duchy lies one of the most ancient possessions of the crown of Austria, the earldom of the Tyrol, which, in conjunction with Upper Austria, has been denominated the 'German Switzerland.' The Rhine forms the lower part of the most elevated mountains in the Austrian dominions, which run through this province from the Grisons frontier to the Illirian, and meet the Noric on that of Upper Austria, are scarcely less lofty than the Alps of Switzerland. The Puster valley in the Tyrol's interior elevation, from the sources of the Etsch, or Adige, in a direct north-easterly line to the valley of the Ziller; and the Mittelberg, or mountains of middle elevation, on whose more fertile plains the town of Bozen or Bolzano looks down, is a valley, the Tyrol and its adjoining plains and valley, where the Tyroloese lowlands have derived their appropriate name of 'Thaler,' or vales, of which about twenty-nine are dotted with town or village, and fertilized by the waters of the Inn, Etsch, Brenta, and a number of other streams. The air is generally pure and keen, though, in the south, the effect of the scirocco is partially felt. The chief products are horses and cattle, grain, wine, fruit, potatoes, timber, salt, iron, copper, silver, lead, and a little gold.

The junction of which touches the eastern borders of the Tyrol, and is composed of the duchies of Carnithia and Carniola, the territory of Triest, Austrian Frioul, Istrius, a portion of Croatia, and the Quarnero Islands at the head of the Adriatic, is principally cultivated in vineyards. The Tergeste, or northern part of the Drave is traversed by the Noric Alps, which extend to the banks of that river; south of it, and next to the Italian frontier, the Carinthian range separates the territory of the Sava and Isonzo from the Drave, and is in contrast with the numberless limestone hills, generally unfavourable to vegetation, and exposed to the prevailing north-easterly wind. The Künstland itself, liable to incessant tempests and burning beats, and by nature sterile and uncultivable, would be a desolate waste but for the industry of its inhabitants, who extort their precarious crops from the most perverse of soils. No country can be more varied in climate than Illiria: in the north, where so many of its mountains are capped with perpetual snows, a pure and bracing atmosphere conduces to health and longevity; and, especially in the vicinity of the mountains, the surface changes to most agreeable and fertile marshes. The maritime districts on the Adriatic are flat and sandy, and abound in lakes of stagnant water, which have been gradually created by the numerous streams which seek an outlet in this dreary waste.

In severe winters, the thermometer has descended 20° of Fahrenheit below the freezing point; snow has been known to lie upon the ground for weeks; and even the lagunas of Venice at times have been covered with ice. In Lombardy, the autumn is long, the winter short, and the continued recurrence of heavy rains, which last two months at a time, or more. The air of the high lands is keen and bracing. On the whole, except the parts in which the marshes and mud-mires, the clays and peats, are considerable, the climate of Lombardy and Venice is unquestionably salubrious. The soil, in addition to most of the usual sorts of grain, produces maize, rice, and millet; pea, beans, potatoes, hemp, and flax; vegetables and fruits of all kinds, which are become almost necessary of life in this climate; and, in some parts, saffron. Such as Lombardy in particular is in pasture land, there is a scarcely a possession of the Austrian crown where the rearing of cattle is in general more neglected; we must, however, exclude from this remark the district of the Breggia, the lakes of Como and Maggiore, where the farms of the peasantry are considerable.

There is no branch of industry more carefully or profitably cultivated than the raising and manufacture of silk; the Alpine districts, too, yield considerable quantities of wool, cotton, wool, and other manufactures.

Mountains.—The larger portion of the Austrian dominions, especially the south-western and eastern provinces, is occupied by mountains, which send out numerous lofty and wide-spreading branches. Their position, to a certain extent, breaks up the Austrian territory into separate parts, and throws great difficulties in the way of internal communication; at the same time, these numerous mountain-ranges give that manifold character to the productions of the different districts which connects them by lines of communication, and renders them independent of each other.

We shall commence our view with the chains which are most remarkable for their extent and elevation.

In the south, the Rhetic or Tyrolean Alps, the greatest range in the Austrian territory, near the southern boundary of the province, entering the Tyrol from the Grisons, beginning on the Austrian side with the highest mountain in the whole empire, namely, the Ortellus, or Ortiers Spitze, at an elevation of 2654 feet above the level of the sea, is divided by the Adda, and extends in a north-easterly direction, covering the Tyrol with its enormous masses, until it terminates at the Three Lords Peak (Drethren-spitze), near the borders of Carnithia, and at no great distance from the source of the Salza, which, at its partial confluence with the branches of the Rhetic Alps is one which heads easterly towards the source of the Mulr, in the circle of Salzburg.
and then running northward westward, from the Tram and Ena, divides into several arms of considerable elevation, which embrace the ancient Fossato, and branch stretches in a southerly direction to the Mont Peligrino, close upon the frontiers of the Tyrolian and Venetian territories, and sends forth its arms under the name of the Lagn, which forms a long and narrow arm which lies between the Lago di Garda and the Brenta, and the Euganean and Venetian hills. In connexion with the Rhetian chain are—2nd, the Noric Alps, which commence at the Three Lords Peak, traverse the whole of Carinthia which lies on the western side of the sources of the L. Lomnitz, traverse the Styria, spread into Lower and Upper Austria, and gradually subside into the plains of Oedenburg in Hungary. A limestome range, to which the Semmering, between Lower Austria and Styria, belongs, accompanies this chain, which, rising into the southern or Galician, and ending in the highlands, called both the Joseph and Leopold's Berge, look down upon the plain in which Vienna is situated. Connected also with the Rhetian, are—3rd, the Carnic or Carnicolum Alps, which commence the Mont Peligrino, in the southernmost Tyrol, run south-eastward through the Illrian provinces of Carniola and Carniola, and gradually subside in the knownland, or government of Treast, on the Adriatic. This chain abounds in iron, lead, copper, and quicksilver. 4th, the Transylvanian or Transalpine Alps, or eastern parts of the Venetian territory, whilst of one of them stretches, in a gradually decliving elevation, from the Terglou in the lower Illria, eastwards beyond Carlowitz, where it terminates, opposite the confluenes of the Danube and Thies. With the region below, to which the town of Deja belong, the Carnic or Carnicolum Alps, which run in a south-easterly direction, between the right bank of the Save and the Isonzo, until they throw out two arms above the town of Iridia in the Illria, province, and the Peak of the Lomnitz, is 8132 feet. They are characterized by Alpine glaciers, snow lakes, and deep chasms, chiefly however in the more northerly regions. In the north they stretch out their arms towards the banks of the Rasa and Biaska in western Galicia; and in the south, as the river Vistula, is the Danube, and the Arva and the eastern end, between the Arva and the Upper Waag. The average elevation of this stupendous mass of granite is between 6000 and 6500 feet; but that of the highest summits does not exceed 8000 feet. The highest part of the whole Carpathian system, but are the only mountains of eastern Europe, north of the Alps, which approach the latter in character. They extend for about 200 miles along the northern confines of Hungary, between the Upper Popaed, and the Danube, and extend their breadth from 50 to 60 miles. One of the branches of this chain, the Sib advocate, which forms the central group next the plains, is celebrated for the excellence of its vineyards. 5. The Beskid, the highest point of which is the Babia, situated, about the northern boundary of the Western Gebirge, and encompassing the northern range of the Central Carpathians, spread along the frontiers between Moravia, Austrian-Silesia, Galicia, and Hungary. Towards the north they extend into the Elevations of Tarnowitz and Czasaw, in the region of the Upper Vistula, whilst their southern range subside on the plains of Hungary. Their western extremity, from which the Bocza springs, stands in immediate contact with—6. The Lesser Carpathians, or Jaworins Carpathians, which commence between Hamburg and Pressburg, on the left bank of the Danube, and form the most westerly group of the parent chain. Thence they take a north-easterly course, crossing the district between the Carpathian and the Western Gebirge, and encompassing the northern range of the Central Carpathians, spread along the frontiers between Moravia, Austrian-Silesia, Galicia, and Hungary. Their greatest elevation does not exceed 2000 feet, from which they decline with thickly-wooded slopes as they approach the March and Waag on the western and eastern sides. The summits of the Greater Carpathian chain are generally covered with forests to a height of 3600 and even 4200 feet, above which there is a succession of naked colossal masses of rock, whose surface is unrelieved by any sign of vegetation beyond a scanty growth of grass. The highest points are everywhere composed of granite, and the less elevated, either of primitive limestone or syenite porphyry and sandstone; the former of these is frequently covered by it. Even at their most elevated points the summits are covered with snow, for it is the ice or snow which accumulates in their hollows
capable of resisting the effect of mid-summer heat and vegetation, which is luxuriant, especially in the lower regions; at higher levels, it becomes more denser and as it approaches the higher regions: the woods on the southern side of the chain next Hungary are alternately composed of fir and pines, and beeches; but, on their northern side, next Galicia, they consist principally of fir, which increases in bulk and height towards the neck, but beeches, but not a single oak exists on the Carpathian soil. Neither the vine nor walnut succeed in the central range.

The declivities of the several Carpathian ranges, but more so in the western, which spread into Hungary and Transylvania, contain the sources of several rivers. On the Hungarian and Transylvanian sides, the Theiss, Sazos, Maros, and Aluta; on the northern and eastern sides of the Carpathians, the Bereich, Moldau, Pruth, Hermath, Geisa, and Sacza; on the western and the Beskid ranges, the Vistula, Dunajec, and Dziest.

The last mountain ranges which we have to notice are the Sudetech and other branches of the Herycynian chain. Where the westerly termination of the Beskid group descends with its broad masses into the low country between the Vistula and Oder, an extensive girdle of mountains takes its rise. Elevating themselves at this point from the narrow plain which lies between the Upper Oder and the Oder, on the north of the Prussian Silesia, and from the southern parts of the Upper Oder, and they rise to the right bank of the Elbe, the right bank of which on the side of Saxony forms its north-westerly limit. The Sudetes are the boundary-line between those portions of the Austrian territory and the Saxon and Prussian dominions which lie to the north of the point at which the Oder has and passage through the Ore-mountain group of the Herycynian chain. They are remarkable rather for their length than breadth; in no part are they completely broken by the interposition of plains, and they occasionally rise from their general elevation by a rich variety of hill and mountain scenery. The character of the Sudetes has led to their subdivision into four distinct ranges; of which the first in order, commencing with their vicinity to the Carpathians, is

The Slezian-Moravian mountain range, so far as the surface, mostly covered with the elevated forests on the confines of the two provinces, contains the sources of the Oder and March. Its mass consists of primitive clay-slate, which at times diverges into muscovite. The central summits of the range have a rather elevated position. The Altavert and Spiegelgitter Schneeberg, rise to 4198 and 4380 feet respectively. A number of branches extend in various directions from the main range; the most northerly descends to the banks of the Oppa, a branch of the Elbe, and the other branches reach the March to the north-eastern quarter of Olmutz. The forests in this range descend along its declivities till they skirt a soil which is variously and highly cultivated. The Altavert, which stands on the side of the March, is connected by the Hunderlickei (or Dog's Back), a long narrow chain running north-westwards, with the second

Glazter-Gebirge, a quadrangular mass of mountains, formed by two parallel groups, distant between 14 and 19 miles from each other, and extending about 40 or 45 miles in a direction from south-east to north-west; they are united in the south by the snow-mountains of Glatz, and in the north by those of Schwednitz in Prussian-Silesia. They consist of the eastern part of Glatz on every side. The south-easterly knot, which is the highest point of the Glazter-Snow Mountains, is, in every respect, the remotest and wildest, as well as the most elevated, region of the whole Glazter-Gebirge. The latter throw out four large arms, which of mountain formation, which connect Prussian-Silesia with Bohemia and Moravia, into all which countries they penetrate in a less or greater degree. The main range is composed of limestone. The principal valleys are at a height of 1200 or 1300 feet above the level of the sea; the river which descends covered with forests to a considerable point of elevation. The Grosser Schneeberg (Great Snow Mountain), 4444 feet in height, is the loftiest summit of this range. The Glazter-Gebirge abut in the south on the Moravian Mountains, sometimes called the Alten-Gebirge, which descend in a south-westerly direction by Leanderkon-Juntan, and Iglau to the Dunab, on the left bank of which they form a junction with the Bohemian Forest Mountains, or Oberwald-Gebirge. The most elevated point in this group is the Pfliekenstein, whose height is 4176 feet. Cultivation here rises to a considerable elevation, and the backs of the mountains are thickly wooded. The western branches of the Glazter chain slope to the plains of Bohemia; and its eastern, after spreading over the northern districts of Moravia, disappear in the lowlands in that quarter. A lofty mass, called the Waldenburg Mountains, in the south-western part of the principality of Schlesovina, enters the Bohematian Maria, and forms a range of high ground, with numerous peaks, towards the north of Bohemia, and into the circle of Liegnitz in Prussian Silesia. The sources of the Iser, which lie within it at a height of 3400 feet, in the Bohemian district of Passau, gush from this range. The Riesengebirge consist of two high groups running in a parallel line with the main range, from the banks of the Iser to those of the greater Aupa, in the north-eastern parts of Bohemia; the loftier group of the two has summits of 4000 feet, which throw out branches which run to the banks of both rivers. The mass of the Riesengebirge is granite, which also distinguishes its highest peaks; and its subsidiary formation is gneiss, which is almost wholly confined to the Elbe group of the range. In the Riesengebirge, the winter prevails on these mountains, which, from being the most elevated any chain in the north of Germany, have not been inappropriately denominated the Giant Mountains, and are so renowned for their rigorous climate, that a greater height on their slopes, or in the valleys, than 1200 feet; nor will oaks or potatoes thrive above 2400 feet — sedum, indeed, beyond that of 1700; wood becomes stunted growth when this exceeds 8000, and the regions which rise behind it are naked granite. In spite of every change in the climate, not only are the valleys and slopes of the Riesengebirge, but even their slopes half way to the top, thickly inhabited: their interior is occasionally the site of a broad tract of marshy flats, and their descent, on the Bohemian side, is far more abrupt than on the Prussian. The Rocky Mountains, or Lauzitser Berge, the fourth and last range of the Sudetech branch of the Herycynian chain, which rise from the vale of the Neisse, in Lusatia, and extend to the banks of the Elbe and Oder, we shall simply observe, in this place, that there is an arm which stretches from the southerly declivity into the heart of that part of northern Bohemia which has the Elbe and Iser for its western and eastern boundaries.

May be described generally of the Sudetes, that their higher regions are of various primitive formations, and, in certain directions, rich in different kinds of ores. The mountain ranges of more moderate height are composed of clay-slate, limestone, and argyrodial, in parts contain beds of slate. The mountains of Bohemia and Moravia, are of felsite, trap, and sandstone, or granite, and basalt, with isolated and towering caps. Both sides of the Sudetech chain abound in streams which spring from their bosom. Of these, the most considerable on the northern side are the Oppa, Neisse, and Neisse-Elbe, all of which flow into the Oder; and on the southern side, the Oder, the three sources of which lie about fourteen miles to the north-east of Olmutz; the March, or Morava, which rises on the right bank of the Elbe; and the Werra, which is tributary to the Elbe; and the Elbe itself, which springs from the southern foot of the Schnee Kopp.

Another considerable range of the Herycynian mountains consists of two mountain ranges, which commence from the left bank of the Elbe at that point of the Bohemian frontier where the river forms a passage into Saxony, and run
ning first in a south-westerly line between the two king-
dom. This is in a south-easterly one between Bavaria and
Bohemia: at the left, the Danube and its tributaries are deflected
from their normal course, and the crest of the two ranges is
separated by the Inn. The middle ranges of the two
kingdoms, and the eastern face of the Saxonian Alb, form
the real barrier between the two great basins of the
Danube; the line of the eastern face of the Saxonian Alb,
converging towards the north-east, forms the boundary
between Bavaria and Saxony. The two ranges are
separated by a long rift of the earth, which contains the
valleys of the Elbe and the Danube, and is called the
Czechoslovakian Line or the Great Rift of Europe. The
valleys of the Elbe and the Danube are filled with alluvial
mud, and the course of the rivers is therefore meandering.

The Czavog, which flows into the Danube near Nitra,
forms the boundary between Austria and Hungary.

The most important rivers of Austria are:

1. The Danube, which flows from the Black Sea to the
sea of the Danube, and is navigable for many miles.

2. The Inn, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

3. The Morava, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

4. The Leitha, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

5. The Tisza, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

6. The Drava, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

7. The Morava, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

8. The Tisza, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

9. The Drava, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

10. The Morava, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

11. The Tisza, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

12. The Drava, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

13. The Morava, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

14. The Tisza, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

15. The Drava, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

16. The Morava, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

17. The Tisza, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

18. The Drava, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

19. The Morava, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

20. The Tisza, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

21. The Drava, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

22. The Morava, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

23. The Tisza, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

24. The Drava, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

25. The Morava, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

26. The Tisza, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

27. The Drava, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

28. The Morava, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

29. The Tisza, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

30. The Drava, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

31. The Morava, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

32. The Tisza, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

33. The Drava, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

34. The Morava, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

35. The Tisza, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

36. The Drava, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

37. The Morava, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

38. The Tisza, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

39. The Drava, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

40. The Morava, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

41. The Tisza, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

42. The Drava, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

43. The Morava, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

44. The Tisza, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

45. The Drava, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

46. The Morava, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

47. The Tisza, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

48. The Drava, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

49. The Morava, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.

50. The Tisza, which flows from the Black Forest to the
sea of the Danube, and is navigable for 100 miles.
The bandicoots (Peromyscus) compose a very remarkable genus which does not admit of a ready comparison with any other group of animals likely to be more familiar to the generality of readers. With a dental system and even an outward form which very much assimilate them to the larger rodents and insectivores they are readily classed, though often confused with true rodents, or true insectivores.

Only one species has been distinctly described, but there are four or five, and probably a greater number of very distinct species found in different parts of the country. Like the larger rodents, these exist almost everywhere; the fore-feet being used as hands to carry food to the mouth and for other similar purposes.

Of the phalangers (Phalangista), so called originally by Buffon, from the union of the two interior toes of the hind feet, are to be found in a great number of our insectivorous quadrupeds; they form burrows, or take refuge during the daytime in natural crevices, or under fallen timber, move about only during the night-time, and are not observed in the daytime. The habits and mode of life generally resemble those of the bandicoot, though not so frequently observed. They are of a smaller size, and agreeably marked with numerous white spots. A certain number of the genera are omnivorous and live for the most part upon birds, reptiles, and other small prey. Only one or two species have been described. The urine dasyur (D. viridis), or native devil, as it is called, is discovered by the colonists, is the ugliest and most disgusting nature quadruped, for it is large in size, rather heavy, has a thick body, thick and heavy, and its head disagreeably large and disproportionate to its legs. It inhabits the coast of Van Diemen's Land, sleeping during the day among the rocks and moving about during the night in quest of dead seals and other marine productions which compose its food. The D. marcoui, D. rivularis, and D. maugeri, are found in Van Diemen's Land as well as on the continent of Australia, and are sometimes called native cats by the colonists. It is not in any case endearing, and is a very peculiar animal which they bear to cats, but from some slight similarity in their habits, as they climb trees readily in pursuit of small birds, and capture their prey more by address than by open fight. The name is given to them by the colonists, a name which is not always applied to the Petaurus scutatus, is about the size of a common rat, of a uniform light ash colour, and has the tail terminated by a pencilled black hair. It resembles the wood mouse in size, but differs from the sugar maple species, from which it has acquired its colonists' name, and appears to live for the most part upon the larger night insects, and probably upon the eggs and young of smaller species. The smallest kind is the D. murinus, or mouse-opossum, about the size of a little larger than the little animal whose name has been transferred to it, and which, like the sugar squirrel, resides upon trees, and lives principally if not entirely upon insects. The genus Thylacinus contains but a single known species, and that apparently confined to Van Diemen's Land. It is as large as a moderate-sized dog, and not unlike the canine species in general form and appearance, except that it is longer in the body and has shorter legs. Its head is of a more moderate size than that of the others, and is of a more regular, and more regularly arranged, and terminating singly upon the sides. Like the generality of marsupial animals, it is nocturnal in its habits, generally keeping concealed in the forests and woodlands during the daytime, prowling about at night in search of prey, and often committing depredations upon the lambs of the colonists of Van Diemen's Land, as the dasyures do in the poultry-yards of New South Wales. For the sake of a single word, I feel inclined to use it, though I feel it is not properly so: it is a cowardly animal, and easily frightened by a courageous dog.

The five species of Rodentia inserted in the tabular distribution of the Australian mammalia, three belonging to the rat genus (Mus), and the remaining two of the same sub-family Hylomys as defined by the most recent writers on mammalogy. The former are but little different from the common species of rats and mice in other parts of the world.
the latter are merely distinguished by their larger size, long
beak and eyes, and the presence of a malagash in the hind feet, which assimilate them
to some measure to the beavers and coypus of America.

They are aquatic in their habits, and are found in most of
the rivers both of Van Diemen's Land and New South
Wales.

The two Edentata, inserted in the table, belong equally if
not more properly to the marsupial order, partaking, indeed,
of the characters of both of these tribes, and forming the
connecting link by which they are united. These animals are
not to be included in the monotremes and anomalous squadrupeds that have ever been discovered. Though they
are certainly quadrupeds in the great majority of their
characters, yet their organs of mastication more nearly
resemble the bills of birds than the corresponding parts of
other animals. The anatomy of these animals is so complex
that it is not unlikely they are true mammals, and nourish their young by a
milk secretion like all other animals of the same class,
yet it is still a matter of keen dispute among naturalists and
physiologists whether they produce their young alive, or
lay eggs and hatch them like birds, or rather perhaps
like reptiles, for the whole detail of their organisation seems
to point them out as intermediate between this class and
ordinary mammals, rather than between mammals and birds.

The most distinctive of the two genera are Ornithorhynchus and Echidna. The former, often called the
duck-billed animal, from the form of its head and face, resides in rivers and ponds, where in fact, like ducks, it
lives principally by searching for seeds and insects among the
vegetation near the banks of the river. For this purpose its bill is
provided with a complicated and delicate tissue of nerves,
which enables it to distinguish its food from the small mud
and gravel with which it is mixed, and it is indented by
small grooves along the sides so as to permit it to strain off
the mud in the clarified water, or to cut the pretty tackle and
snare time. It forms deep burrows along the banks of the rivers,
which are provided with two entrances, one above and the
other below the level of the stream, so as to afford it a
safe retreat from its enemies. If this is not the case, it is
exposed to the attacks of the nectaraneis, or, O. fusus, and O. fuscus; other consider
them both as varieties of the same species, to which they are
gave the name of O. paradoxus. The genus Echidna, though it agrees in its general structure, and in the very
anomalous nature of its production with the ornithorhynchus,
yet differs widely from that animal in its external appearance,
as also in its habits and economy. It is covered with
short soft prickles not unlike those of a porcupine, feeds
upon grubs and tubers, and is a very shy and cautious
animal, rears its young, resides in deep burrows of its own
formation, and hibernates or sleeps during the winter season.

Of this genus there are two species, one without any
abnormality, the other long rag hair intermixed with the
spines, and called respectively from this circumstance, E
spinosa and E. setosa.

The coasts of Australia have been long known as the
occasional resort of immense shoals of whales, dolphins,
and other cetaceans that inhabit the waters of the globe.
Many vessels are now annually fitted out from Sydney and Hobart's Town for this valuable branch of commerce,
and the success which has hitherto attended the speculations has been a most important accession to the
general resources and prosperity of the colonies. The seal
fishery also has been attended with considerable success,
and the sea otter and sea animals form very important
items in the annual colonial exports.

The ornithology of Australia, though far from being so
cumbersome and anomalous as its mammalogy, contains,
nevertheless, many very singular forms and wants many of
those singularities which have hitherto attended the
speculation. Among rapacious birds, eagles, falcons, and various
species of hawks abound everywhere, as well as owls of
different kinds. The common peregrine falcon (Falco peregrinus), and the barn-owl of Europe (Strix flammea) are
said to be found near the south of the continent, but the
colonists have been, hitherto attended the speculations has been a most important accession to the
general resources and prosperity of the colonies. The seal
fishery also has been attended with considerable success,
and the sea otter and sea animals form very important
items in the annual colonial exports.

The preceding statement gives a view of the customary subdivision of the territorial surface of the Austrian dominions; but for the purposes of internal administration, they have been subdivided in a somewhat different order, though the number of subdivisions or provinces remains the same. These are —

I. The Archduchy of Austria, composed of —
   1. The province of A. below the Danube, which includes the city of the same name and the counties of Wurzberg, and the Lower and Upper Marchenlberg.
   2. The province of Lower Austria, divided into five circuses, those of the Mosel, Hincus, Hinz, Tunis, and Hainburg.

II. The Duchy of Styria, containing five circuses, viz.:
   1. Bruck, St. Wolfgang, and Hainburg.

III. The Kingdom of Bohemia, divided into:
   1. Prague, with five circuses, Kinober, Vilhyn, Leobersdorff, and Atterberg.
   2. Triest, with three circuses, Triest, Intire, and Oliva.

IV. The Archbishopric of Salzburg, containing five circuses, viz.: Upper and Lower Iselberg, Fischlberg, Einbeck, Tribza, Reover, and Vornberg.

V. The Duchy of Silesia, divided into the three circuses of:
   2. Koenigrieth, Goetze, Biber, and Klusen, besides the

VI. The Margraviate of Moravia and Silesia, containing eight circuses, viz.:
   1. Dison, Bran, Zasv, Igaz, Prana, Hradz, Treymaz, and Trebers.

VII. The Kingdom of Hungary, consisting of four provinces, viz.: Buda, Pest, Vienne, and Transylvania.

VIII. The Kingdom of Bohemia, containing four circuses, viz.:
   1. Prague, with three circuses, Triest, Intire, and Oliva.
   2. Breslau, Braxov, Stett, Liber, and Palmach.
   3. Koenigrieth, Goetze, Biber, and Klusen, besides the

IX. The Principality of Transylvania, containing 1. The Land of the Magyars, with 15 circuses.

X. The Kingdom of Hungary, consisting of:
   1. The Province of Milos, with nine circuses, viz.:
      2. Buda, Pest, Vienne, and Transylvania.
   3. The Province of Transylvania, containing:
      4. The Province of Pest, the other, viz.:

The preceding statement gives a view of the customary subdivision of the territorial surface of the Austrian dominions; but for the purposes of internal administration, they have been subdivided in a somewhat different order, though the number of subdivisions or provinces remains the same. These are —

I. The Archduchy of Austria, composed of —

   1. The province of A. below the Danube, which includes the city of the same name and the counties of Wurzberg, and the Lower and Upper Marchenlberg.

   2. The province of Lower Austria, divided into five circuses, those of the Mosel, Hincus, Hinz, Tunis, and Hainburg.

II. The Duchy of Styria, containing five circuses, viz.:

   1. Bruck, St. Wolfgang, and Hainburg.

III. The Kingdom of Bohemia, divided into:

   1. Prague, with five circuses, Kinober, Vilhyn, Leobersdorff, and Atterberg.

   2. Triest, with three circuses, Triest, Intire, and Oliva.

IV. The Archbishopric of Salzburg, containing five circuses, viz.: Upper and Lower Iselberg, Fischlberg, Einbeck, Tribza, Reover, and Vornberg.

V. The Duchy of Silesia, divided into the three circuses of:

   2. Koenigrieth, Goetze, Biber, and Klusen, besides the

VI. The Margraviate of Moravia and Silesia, containing eight circuses, viz.:

   1. Dison, Bran, Zasv, Igaz, Prana, Hradz, Treymaz, and Trebers.

VII. The Kingdom of Hungary, consisting of four provinces, viz.: Buda, Pest, Vienne, and Transylvania.

VIII. The Kingdom of Bohemia, containing four circuses, viz.:

   1. Prague, with three circuses, Triest, Intire, and Oliva.

   2. Breslau, Braxov, Stett, Liber, and Palmach.

   3. Koenigrieth, Goetze, Biber, and Klusen, besides the

IX. The Principality of Transylvania, containing 1. The Land of the Magyars, with 15 circuses.

X. The Kingdom of Hungary, consisting of:

   1. The Province of Milos, with nine circuses, viz.:

   2. Buda, Pest, Vienne, and Transylvania.

   3. The Province of Transylvania, containing:

   4. The Province of Pest, the other, viz.:

Soil, climate, and productions. — The Austrian dominions contain, in almost every part, lofty mountains, some forming the natural limits of demand, and others, like the Alps and their branches, in the south and west, penetrating into the heart of the empire, the natural cordon of the empire in this direction. The plains do not occupy more than about a fifth part of the whole surface; the low extensive levels which exist are found next to the northern declivities of the Carpathians, in Galicia, and in the southeastern parts of the empire, Hungary, the Transylvania branch of the Carpathians; they prevail within the Slavonian borders, and form the distinguishing feature of that portion of the Austrian possessions in the north of Italy which lies between the Alps and the Apennines.

The soil is of endless variety, but in general favoured by a mild and genial climate, and distinguished by remarkable productiveness.
its surface. The lowland of which we have spoken occupies about 55,000 square miles; the larger portion, an area of about 21,000 miles, lies between the Danube and the Transylvanian mountains, and is watered by river and the Tisza for a length of upwards of 300 miles, and

unfit for agriculture. The Carpathian plain is watered by most cold, and beds of chalk. These beds are intermingled with layers of granite, gneiss, and quartz, and here and there rise from the surface into low hills; and the Galician soil is no where so productive as in the district of Zloczow, near the Hungarian border. Galicia is of northern temperature, for there are few parts in which the cold influence of the Carpathian atmosphere is not sensibly felt: hence the grape and most other fruits do not generally ripen complectely.

The south-western limits of Galicia adjoin the high mountain regions of Austrian Silesia, a country as poor in grain as is abundant in pastures and timber, and known, in common with Moravia and Bohemia, for its growth of flax and its linen manufactures.

South-west of Moravia, which, compared with the adjacent regions of Hungary or Bohemia, has a far milder climate; it is mountainous in its eastern, northern, and western districts, but low and open towards the centre and south, the rich expanses of which has been styled a land of meadow and wine. In this direction it presents a line of rich and finely-cultivated plains; but the remainder of the province, occupying upwards of one-half of its area, is intersected by arms of the Sudente and Carpathian ranges, between which are many narrow, and many fertile valleys. The greater portion of the province is from 800 to 900 feet above the level of the sea.

West of Moravia lies the great Caudron Plain of Bohemia, bound on every side by the granito-basalt chain of the Bohemian Highlands, and bounded south-east by the Bohemian Beskids (Bohemia) and Ore (Zgebige) moun
tains, which send out their offsets into the interior of the country. The heart of this kingdom presents a surface of gentle undulations, studded in many parts with lofty heights rising from the plains, from which a fine view towards the central and lowest part of Bohemia, the Vally, reigns so bright, in that there is scarcely a river which does not rise within its own boundary, or close upon it. The plains, which occupy its central area, is equally divided from the Beskids by the rivers of the Bohemian Beskids, which enjoy a mild, regular, and healthy temperature; but the climate is raw and variable over the larger part of its surface, which is occupied by the highlands and mountains.

Moravia is rich in animal and vegetable produce; and the arable and other productive lands, although nearly two-thirds of the surface are occupied by woods and forests, extend over four-sevenths of the Bohemian territory.

The Archduchy of Austria consists of two provinces; the lower province is intersected on the confines of Styria by a branch of the Noric Alps, and its centre by one of their smaller arms, the Cetian mountains, whilst the warm and fertile valley of the Danube traverses this and the upper province. This branch of the Danube valley, known as the Lower province, which forms the western part of the archduchy, is a mountain region, the southern portion of which in the lofty peaks, glaciers, and valleys which distinguish the Noric Alps; the northern contains part of the less elevated summits of the Bohemian Forest chain or the Böhm-merwald Gebirge. The lower province is poor as a corn country; but produces much fruit and wine, iron, silver, and coal, and may, in a manufacturing point of view, be considered as the base of Austria. The upper province, which includes the Salzburg territory, and contains, in proportion to its extent, more rivers and lakes than any other district in the empire, has a soil which, in spite of the skill and unwarried industry of its inhabitants, does not yield enough for the support of the population. The chief products of the province, which seems naturally to divide itself into Upper and Lower Styria, is amply provided with rivers and streams, whence its rich pastures, and abundant crops of every kind of grain, of clover, vegetables, fruit, and wines, and its fine races of horses and cattle. Besides this, no country of the
same extent in Europe is more valuable for its stores of salt, iron, steel, and tin, and its works and manufactories.

West of this duchy lies one of the most ancient possessions of the crown of Austria, the earldom of the Tyrol, which, in conjunction with Upper Austria, has been denominated the 'German Switzerland.' The Rhine, which forms the most elevated mountains in the Austrian dominions, which run through this province from the Grison frontier to the Illirian, and meet the Nore on that of Upper Austria, are scarcely less lofty than the Alps of Switzerland. The Ferlach mountains, in the south of the Tyrol, in the first instance, from the sources of the Etsch, or Adige, in a direct north-easterly line to the valley of the Ziller; and the Mittelberg, or mountains of middle elevation, on whose more fertile slopes face the Alps, lock down the broad valley of the Inn, and renders the whole a most fertile and fruitful country.

The Tyrolean highlands are composed of an inferior formation, and the Tyrolean lowlands have derived their appropriate name of 'Thaler,' or tales, of which about twenty-nine are dotted with town or village, and fertilized by the waters of the Inn, Etsch, Brenta, and a number of other streams. The air is generally pure and keen, though, in the south, the effect of the seacoast is partially felt. The chief products are horses and cattle, grain, wine, fruit, potatoes, timber, salt, iron, copper, silver, lead, and a little gold.

The line which touches part of the eastern borders of the Tyrol, and is composed of the duchies of Carnutta and Carniola, the territory of Triest, Austrian Frioul, Istria, a portion of Croatia, and the Quarnsy Islands at the head of the Adriatic, is principally of mountainous character. The head of the Adriatic is bordered by the Norie Alps, which extend to the banks of that river; south of it, and next to the Italian frontier, the Carinthian range separates the territory of the Savo and Isouzo from that of the Austrian Tyrol; and, in contrast with numbers of ranges, the Julian, or Carniolan Alps, run in a south-easterly course towards Dalmatia, until it is bounded by the Adriatic. These ranges are full of lakes (among others, the celebrated Zrkritzer in Carnutta, which wholly loses its wildness during the first days of February, and is the scene of the famous Battle of the Drave) is bordered by the Norie Alps, which extend to the banks of that river; south of it, and next to the Italian frontier, the Carinthian range separates the territory of the Savo and Isouzo from that of the Austrian Tyrol; and, in contrast with numbers of ranges, the Julian, or Carniolan Alps, run in a south-easterly course towards Dalmatia, until it is bounded by the Adriatic. These ranges are full of lakes (among others, the celebrated Zrkritzer in Carnutta, which wholly loses its wildness during the first days of February, and is the scene of the famous Battle of the Drave).

and then running north-east between the Tisza and Mor, de
tives into several arms of considerable elevation, which
subside in the valley of the Danube. Another principal
branch stretches in a southerly direction to the Monte
Pellegrino, close upon the frontier of the Tyrolese and
Venetian territories, and sends forth its arms under the
name of the Maggiolo (a continuation of the Lago di Garda
and the Brenta) and the Euganean and
Benvian hills. In connection with the Rhetian chain are
—2nd, the Vortic Alps, which commence at the Three
Lake valley near Thurn, which continues along the
left bank of the Drave then turn eastward through
Styria, spread into Lower and Upper Austria, and
gradually subside into the plains of Oedenburg in Hungary.
A kilometre range, which the Sommering, between Lower
Austria, and 100 miles, and about 100 miles beyond that
north or northern arm, the Kahlen and Leitha hegatas,
commonly called the Joseph and Leopold’s Berge,
look down upon the plain in which Vienna is situated.
Combined also with the Rhetian, are—3rd, the Carnic or
Carnic-Haus Alp, which commence at the Monte Pellegrino,
in the southernmost Tyrol, run south-eastward through the
Illyrian provinces of Carnia and Carniola, and gradually
subside in the Kistliland, or government of Triest, on the
Austrian sea-coast, and form a considerable barrier to the
traffic from the interior of the empire; enclosing the
Kaatalsch; and many minor branches descend into the
eastern parts of the Venetian territory, whilst one of them
descends, in a gradually declining condition, from the Terglow
in Western Ilyria, eastwards beyond Carlowitz, where it
terminates, in about 50 miles along the coast, and on
adjoining the coast, with the Dinaric Alps, which, from this
point, traverse that part of Austria—Croatia between the Kupa and
and right bank of the Save, and then enter Turkish Croatia; whilst
a branch turns westward, spreads out in short ranges to the
very borders of the Adriatic, and converts a considerable
portion of the narrow elongated surface of Dalmatia into a
mountain-region, of which the Monte Dinar (3669 feet in
height) is considered the highest and the Tsercin, or peak of
the Dinaric Alps, which spreads through the Archduchy of Austria, and,
and south of it in Ilyria, Ilyria, Ilyria, Ilyria, and Dalmatia, as
ranges exceeding 3600 feet, the stupendous elevation of the
chain of the Alps, extending over one-half of their elevation.
The eastern and northern territory of Austria is characterized
by its own independent mountain system. The Carpathians, which commence near Pressburg on the
Danube, near the north-western border of Hungary, are con
ected by their northward alone with the Sudetische branch of the
Hercynian chain; and when they reach the district where the
boundaries of Austrian Silesia, Moravia, and Hungary meet,
attain a great elevation. From this point the principal masses spread in an arch to the east and south
in a southerly course until it reaches the south-eastern ex-
trianity of Transylvania at Mount Mosa Mika, from which
point it turns towards the west, and then deviating a little to
the north-west, crossing in about 100 miles on the left bank of the Danube near Old Orsova,
close upon the frontier of Wallachia. In this course, the
Carpathians form a boundary-line, separating Hungary from
Moravia, Austrian-Silesia, Galicia, and the Buck
owice, and the Carpathian range, the Moravian Maha
chis in the east and south; and the military frontier of
southeastern Hungary from the western confines of Wolf
chis, and the northern of Sava, on the right bank of the
Danube.

We have already noticed the extensive portions of the
surface of Hungary, Galicia, the Buckowice, and Trans-
valls, which the Carpathians cover. The principal group
wises into which they are usually subdivided are:—1. The
Carpathians proper, divided by trap and breccia ranges stretching
first north-eastward through the Austr

have their name, from Ujipalanka, below Weiskirchen
about 70 miles west of Celts, and subdivide gently at
Mount Pietrozza, a little to the north of the
north of the Theiss in the Hungarian circle of Maramoros.
No summits in this group exceed 4000 feet in elevation until they have
reached the territory of Moldavia. They slope gently, on
the west, into the plateau of the Buzac, and descend to
the north of Kamen, and Wardein, and occupy a surface of which the greater
length is about 350 miles, with a breadth varying from 23
and 95 miles. 2. The Waldgebirge or Forest Mountains, the
Theiss in the Hungarian circle of Maramoros. No summits in this group exceed 4000 feet in elevation until they have
reached the territory of Moldavia. They slope gently, on
the west, into the plateau of the Buzac, and descend to
the north of Kamen, and Wardein, and occupy a surface of which the greater
length is about 350 miles, with a breadth varying from 23
and 95 miles. 2. The Waldgebirge or Forest Mountains, the
or northern or central side of which the Draist springs. On
this north side they descend, covered with forest and swamp,
to the Galician plain, their base being terminated by those
effervescent banks of rock-salt, between 700 and 800 feet deep,
which appear to spread eastward almost to the verge of the
Ural chain in Southern Russia. Their southern slopes
fall into the plains of the Theiss in Hungary, and, where the
line of forest ceases, they are well cultivated, and highly
benefited by the vine. 3. The Carpathian or Tuscar Mountains: these not only constitute
the loftiest mass of the whole Carpathian system, but are the
only mountains of eastern Europe, north of the Alps, which
approach the latter in character. They extend for about 150
miles along the coast, and on the south, as far as the
Upper Pored and Dunajec, which lie at their southern
eastern end, between the Arva and the Upper Waag. The
Julian or Julian Alps, which run in a south-eastward direction
between the right bank of the Save and the Isonzo, until
they throw out two arms above the town of Istrija in the
Illyrian province of Litorina, the eastern and southern
and eastern descending along the left bank of the
and right bank of the Save, and then enter Turkish Croatia; whilst
a branch turns westward, spreads out in short ranges to the
very borders of the Adriatic, and converts a considerable
portion of the narrow elongated surface of Dalmatia into a
mountain-region, of which the Monte Diiria (3669 feet in
height) is considered the highest and the Tsercin, or peak of
the Dinaric Alps, which spreads through the Archduchy of Austria, and,
and south of it in Ilyria, Ilyria, Ilyria, and Dalmatia, as
ranges exceeding 3600 feet, the stupendous elevation of the
chain of the Alps, extending over one-half of their elevation.

The eastern and northern territory of Austria is characterized
by its own independent mountain system. The Carpathians, which commence near Pressburg on the
Danube, near the north-western border of Hungary, are con
ected by their northward alone with the Suedetische branch of the
Hercynian chain; and when they reach the district where the
boundaries of Austrian Silesia, Moravia, and Hungary meet,
attain a great elevation. From this point the principal masses spread in an arch to the east and south
in a southerly course until it reaches the south-eastern ex-
trianity of Transylvania at Mount Mosamika, from which
point it turns towards the west, and then deviating a little to
the north-west, crossing in about 100 miles on the left bank of the Danube near Old Orsova,
close upon the frontier of Wallachia. In this course, the
Carpathians form a boundary-line, separating Hungary from
Moravia, Austrian-Silesia, Galicia, and the Buck
owice, and the Carpathian range, the Moravian Maha
chis in the east and south; and the military frontier of
southeastern Hungary from the western confines of Wolf
chis, and the northern of Sava, on the right bank of the
Danube.
capable of resisting the scorching midsummer heat; vegetation, which is luxuriant, especially in the neighbourhood of the more central range, becomes languid as it approaches the higher regions; the woods on the southern side of the chain next Hungary are alternately composed of fir, pines, and beeches; but, on their northern side, next Germany, they consist of fir, beech, and spruce; and with pines and fir, and at times with beeches, but not a single oak exists on the Carpathian soil. Neither the vine nor walnut succeed in the central range.

The declivities of the several Carpathian ranges, but particularly those which spread into Hungary and Transylvania, contain the sources of several rivers. On the Hungarian and Transylvanian sides, the Theiss, Saxa, Maros, and Aluta; on the northern and eastern sides of the Carpathians, the Berezh, Hermans, Granta, and Neutra; and in the central and Beskid ranges, the Waas, Vistula, Dunajec, and Dunister.

The last mountain range which we have to notice are the Sudetech and other branches of the Hercynian chain. Where the westerly termination of the Beskid group descends with its broad masses into the low country between the Vistula and Oder, an extensive girdle of mountains takes its rise. Elevating themselves at this point from the narrow plains of Moravia and Bohemia, and bounding a vast part of the Upper Saxonian territory by the great extent of their eastern extremity, and from the plain of the Hana or Upper March, the lofty chain of the Sudetes follows a north-western direction for more than 200 miles through the upper part of Moravia, Austrian-Silesia, and Bohemia. As it descends, it arrives at the Elbe, the right bank of which on the side of Saxony forms its north-western limit. The Sudetes are the boundary-line between those portions of the Austrian territory and the Saxon and Prussian dominions which lie to the east. At a point at which the chain has forced a passage through the Ore-mountain group of the Hercynian chain, they are remarkable rather for their length than breadth; in no part are they completely broken by the interposition of plains, and their elevations vary from 1000 to a height of 4000 feet. The natural character of the Sudetes has led to their subdivision into four distinct ranges; of which the first in order, commencing with their vicinities to the Carpathians, is

The Silesian-Moravian range, whose surface, mostly covered with the elevated forests on the confines of the two provinces, contains the sources of the Oder and March. Its mass consists of primitive clay-slate, which at times diverges into mica-slate. The central summits of the range have an altitude of 4000 feet, of which the Altivar and Spiegelteich Schneeberg, rise to 4288 and 4380 feet respectively. A number of branches extend in various directions from the main group; the most northerly descends to the bank of the Oder, the Elbe, and the March, and the more southerly runs parallel with the left bank of the March to the neighbourhood of Olmitz. The forests in this range descend along its declivities till they skirt a soil which is variously and highly cultivated. The Altivar, which stands in the north-Alten-clay, where more than in all by the Hunderich (or Dog's Back), a long narrow channel running north-westwards, with the second or

Glater-Gebirge, a quadrangular mass of mountains, formed by two parallel groups, distant between 14 and 19 miles from each other, and extending about 40 or 43 miles in a direction from south-east to north-west; they are united in the south by the snow-mountains of Glater-Gebirge, and in the north by those of Schwednitz in Prussian-Silesia. The snow-mountains of Glater-Gebirge rise on every side. The south-easterly knot, which bears the name of Glater Snow Mountains, is, in every respect, the rarest and wildest, as well as the most elevated, region of the whole Glater-Gebirge. The latter throw out four large arms, chiefly of sandstone and sandstone-abound, which extend from the north to south, and are bounded on the north side by the Oppa, Neisse, Bober, and Neisse in Lusatia, all of which flow into the Oder; and on the southern side, the Oder, the three sources of which lie about fourteen miles to the north-east of Olmitz; the March, or Morava, which flows into the Danube; and the Elbe, which, after passing through the Black Forest, and the Elbe itself, which springs from the southern foot of the Schnee Koppe.

Another considerable range of the Hercynian chain consists of two mountain-ranges, which commence from the left bank of the Elbe near the town of Lusatia, where the river forces a passage into Saxon, and runs

to the Danube, on the left bank of which they form a junction with the Bohemian Forest Mountains, or Böhmerwald-Gebirge. The most elevated point in this group is the Pfückenstein, whose height is 4176 feet. Cultivation here rises to a considerable elevation, and the backs of the mountains on the left side are, the most celebrated of all. Glater-Gebirge throws itself down into the plains of Bohemia; and its eastern, after spreading over the northern districts of Moravia, disappear in the lowlands in that quarter. A lofty mass, called the Waldenburg Mountains, in the south-western part of the principality, successively divides the Glater-Gebirge with the third range of the Sudetes.

The Riesengebirge, or Giant Mountains, which mark the north-eastern boundary of Bohemia, rise rapidly from the low region in the south west of Prussian Silesia, where they make their appearance in the vicinity of the Schnee Koppe; they ascend north-westwards until they attain an elevation of 5038 feet at the Giant, or Snow-Cap (Schnee-Koppe), which lies nearly in the centre of the group, and then descend into the vale of the Neisse close upon the environs of Zittau, in Saxon Lusatia. The latter half of this range, its wildest and most inclement region, is more commonly known under the appellation of the Iserkamm, or Iser Mountains, and stretches in four parallel masses, with numerous well-defined and abrupt peaks, the breadth of about fourteen, from the vale of the Neisse into the north of Bohemia, and into the circle of Liegnitz in Prussian Silesia. The sources of the Iser, which lies within it at a height of 3400 feet, in the Bohemian district of Lusatia, give rise to that same river, which, after its union with tributaries from the Riesengebirge, consists of two high groups, running in a parallel line with the main range, from the banks of the Iser to those of the greater Aupa, in the north-eastern parts of Bohemia; the loftier group of the two has summits which rise to 4000 feet, and which throw out branches which run to the banks of both rivers.

The mass of the Riesengebirge is granite, which also distinguishes its highest peaks; and its subsidiary formation is limestones, which are generally found in the Prussian-Silesia, and mica-slate. Nearly nine months of winter prevail on these mountains, which, from being the most elevated of any chain in the north of Germany, have not been inappropriately denominated the Giant Mountains. The rawness of their climate prevents eye from opening at a greater height on their slopes, or in the valleys, than 1200 feet; nor will oats or potatoes thrive above 2400 feet—seldom, indeed, beyond that of 1700; wood becomes of stunted growth when this exceeds 8000, and the regions which rise behind them in its absence are nothing but confused heaths. The sub-tropical climate and climate of the Elbe valley, on the north side, is far more abrupt than on the Silesian. Of the Lusatian Mountains, or Lausitzer Berge, the fourth and last range of the Sudetech branch of the Hercynian chain, which rise from the vale of the Neisse, in Lusatia, and extend on the banks of the Elbe, at whose termination is located in this place, that there is an arm which stretches from an southerly declivity into the heart of that part of northern Bohemia which has the Elbe and Iser for its western and eastern boundaries.

It may be marked generally of the Sudetech, that their higher ranges are of various primitive formations, and, in certain directions, rich in different kinds of ores. The mountain ranges of more moderate height are composed of clay-slate, lime-slate, and amygdaloid, and in parts contain coal and iron. The influences of the forest climate and soil, which are a mixture of clay-slate and Bohemia, are of flint-flap and sandstone, and gneiss, and basalt, with isolated and towering caps. Both sides of the Sudetech chain abound in streams which spring from their bounds. On the west side, the most considerable on the north side are, the Oppa, Neisse, Bober, and Neisse in Lusatia, all of which flow into the Oder; and on the southern side, the Oder, the three sources of which lie about fourteen miles to the north-east of Olmitz; the March, or Morava, which form a junction with the Danube; and the Elbe, which the Elbe itself, which springs from the southern foot of the Schnee Koppe.
first in a south-westerly line between the two king-

doms, and then in a south-easterly one between Bavaria
and Bohemia, terminate at Linz upon the Danube. The
former, denominated the Ore Mountains of Saxony and
Bohemia (Sächsisch-Böhmische Erzgebirge), extend from
the left banks of the Elbe to the Moravian plateau of
Bohemia which the Eger drains after crossing the north-western
quarter of Bavaria; from this point also the group called the
Bohemian Middle Mountains (Mittel Gebirge), an isolated
range of basalt and porphyry formation, at no point rising
higher than 3000 feet above the sea, with a number of little
summits and finely wooded slopes, across the north-western
districts of Bohemia to the vicinity of Leosvitz, is nearly a parallel
line with the Erzgebirge. The Ore Mountains, whose
narrow right side spreads into Saxony, and descends, in terraces
like declivities, to the Elbe. They extend along the whole
of their south-westerly course, with abrupt descent, to the
valleys of the Erger and Biela, which contain Carlsbad
and other celebrated mineral springs. The whole range,
with few exceptions, particularly the rocky masses of sand-
stone next the banks of the Elbe, is of granite and gneiss;
its conical summits are well wooded, and it abounds in
minerals. Its slopes are inhabited, and cultivated to a
considerable height. Its length, on either side of the
Böhmen-Karlsbader and the Saxonian and Bohemian
Mountains, is at ninety-five miles, whilst its breadth, in this
direction, varies from twenty-eight to thirty-two.

The second and south-easterly line of the Hercynian
chain commences in the elevated plain on the right bank of
the Elbe; it runs between Böhmen and Saxony until it reaches the
mountains on the side of the Moldau, and thence, pro-
duced to the southern extremity of the Bohemian Mittel
Gebirge. Under the denomination of the Bohemian Forest
Mountains (Böhmische Waldgebirge), termed by the
natives the Erzgebirge, it runs between Bohemia and Bavar
ia until it reaches the line of the Moldau; it is 119 miles
long, and is bounded from the north-western extremity of the arch-
duchy of Austria, at the base of the Drey-Sessel Mountai
; from this point it divides into an easterly chain, running
between the Moldau and the Moldau basin of the Moldau
from the Archebachtal ; and also into a southerly chain, which
terminates on the left bank of the Danube at Linz. Its
branches descend into the centre of the south-western
parts of Bohemia; one of them, in particular, which ad-
joins Austria, is the line of the higher part of the
Buzan and the Moldau. The principal chain of the
Böhmische Waldgebirge is between 116 and 120 miles in
length, and its average breadth about 20; its general features
are those of a wild, gloomy, thick-wooded, and precipitous
mass of mountains, which are separated from the
narrower elevations on the side of Bohemia, in the districts of
Klattau, Prachin, and Budweis, the Dreyseessel Mountain, which
is 3795 feet, and the Kuban, which is 4218 feet high. It is
very rich in minerals; and that portion of it which
lies within the archduchy of Austria possesses its own
name for that of the Karlsberge, or Saarergebirge. The
principal rivers which spring from the Böhmische Waldgebirge are
the Naab, Regen, Beroun, Vottova or Ottova, and Moldau.
The last of this list, or the River, is 130 miles in length and
height, and in that other range of the Hercynian chain by which Moravia
is separated from Bohemia, whence it has derived the name of the
Moravian Mountains (Mährische Gebirge). At their south-western extremity, they unite with the offsets of the
Böhmen-Karlsbader Gebirge, in the neighbourhood of Linz, spread
northwards, and direct their course northwards, forming the line of frontier between Bohemia and
Moravia, until they form a junction with the Glattzer Gebirge
of the Sascha chain, as already described, Baden and Carinthia.—The only sea-coast
of which this great empire possesses is on the Adriatic, the
waters of which, as far as the Austrian dominions are con-
cerned, extend from the Punto di Goro along the eastern
shore of the Adriatic, in the neighbourhood of Triest, and
the frontiers of the governments of Istria in Italy to the
litigations of Hungary and Austrian Croatia, and the western limits of
Dalmatia to their most southerly extremity. In describing
this line, the Adriatic not only makes four considerable
bays to be mentioned at both of which is a large lake—
Kroatien or Quarnero, and the Bay of Cattaro—but forms
several narrow straits called canals, between the islands
and mainland in its north-eastern parts; such as the
Moro-

drian canal on the coast of Dalmatia, the canals of Pag, 
Zara, di Monte, Solta, Brač, Cres, and Hvar, and

A U S  

A U S

extent, cut off from communication with the bulk of the
Austrian dominions by intervening mountains, over which the
roads are difficult, the benefits of the Adriatic canals to
Austrian navigation are almost entirely confined to the
provinces immediately adjacent to it.

The Austrian territory, with regard to lakes and inland
water, will best be comprehended in Europe in general, in
particular in its southern and eastern provinces. The
Platten See, or, as the natives call it, Lake Balaton (from a
Slavonian word implying dirt or mud), is in the south-west
province of Hungary, lies about 60 miles south of Komorn on the
Danube. It is 15 miles in circumference, including the
swampy borders; and it receives the Szale, and upwards of forty streams and rivulets. About 70
miles to the north-west of the Platten Se lies the Neusiedler See, or the Neusiedlersee, an
unavowable lake, which contains 120 square miles of surface, and is at least 60 miles in circumference.
The inclusions of salt, soda, and vitriol, which are found along its sides, render its
water unfit for use. There is a small lake among
the Carpathians, the Grüner See, or Green Lake, on the
Tatra mountains, in the northern circle of Lipstau, in Hungary, the water of which has a green appearance, but proves to be
pure and transparent when drawn out. There is an abun-
dance of small fishes and swarms, scattered, as we have before
observed, over the Hungarian soil. Remarkable
of these are the Palatih and White lakes, which are
impregnated with natrium, and situated between There-
sonapol and the right bank of the Theiss. The adjacent
regions are a series of extensive plateaux, intersected by
a number of valleys, and inhabited by a people who
live by fishing and hunting. These lakes are

extent, cut off from communication with the bulk of the
Austrian dominions by intervening mountains, over which the
roads are difficult, the benefits of the Adriatic canals to
Austrian navigation are almost entirely confined to the
provinces immediately adjacent to it.

The Austrian territory, with regard to lakes and inland
water, will best be comprehended in Europe in general, in
particular in its southern and eastern provinces. The
Platten See, or, as the natives call it, Lake Balaton (from a
Slavonian word implying dirt or mud), is in the south-west
province of Hungary, lies about 60 miles south of Komorn on the
Danube. It is 15 miles in circumference, including the
swampy borders; and it receives the Szale, and upwards of forty streams and rivulets. About 70
miles to the north-west of the Platten Se lies the Neusiedler See, or the Neusiedlersee, an
unavowable lake, which contains 120 square miles of surface, and is at least 60 miles in circumference.

and southern extremity borders on Piedmont, and nearly the whole of its eastern banks on the government of Milan as long as the Ticino, and has had in communication with the capital of Lombardy by the Ticino, or Tessino, which flows through it, and the Ticino or Naviglio canal. It is above forty-five miles in length, and from four and a half to seven miles in breadth. The outlet of the lake, the Ticino or Naviglio, is connected with the former by the Trebbia; the larger portion of this lake is in the canton of Tessino; it is nearly twenty-five miles long, has an average breadth of about five, and on the Lombardy side upwards of forty. The region of the Alps and lakes is of importance in this quarter is situated wholly within the Austrian territory: they are the Lago di Como, which lies a little to the east of the latter, in the north-western part of Lombardy. Its length is about thirty-three miles, and breadth varying from about five to fourteen miles; it is deep enough to be navigated by large vessels, is traversed by the Mincio, and receives the waters of the Barca and several minor streams.

Some distance east lies the lake Iseo, which lies north-west of Brescia, and is traversed in its whole length of nineteen miles by the Oglio; Idro, to the east of the Iseo, seven miles long, through which the Chiese flows; and d Allegh, in the same length, in the designation of Vicenza, may be added.

The adjoining exordium of the Tyrol and Vorarlberg has numerous lakes, but they are of limited size; the largest, called the Achensee, in the circle of the Vale of the Lower Inn, is divided into four miles long, and breadth varying from about five to fourteen miles; it is deep enough to be navigated by large vessels, is traversed by the Mincio, and receives the waters of the Barca and several minor streams.

In closing this summary of the principal inland seas which lie scattered over the Austrian dominions, we must not omit the multitude of sheets of water to which the Boemipan, Galicians, and Moravians, give the name of seen, or lakes, though neither from their extent nor any other characteristics is this an appropriate term. Both are, especially, seen, or lakes, in the provinces of Alland and Raanmounthe, in the respective circles of Klauau, Budweis, and Saitz, possess so great an abundance of these sheets of water, or teiche, that they were estimated, forty years ago, at 927 feet, and the extent of its surface is set down by the former as 972 feet at Passau, 690 at Linz, 486 at Vienna, 312 at Pressburg, 258 at Raab, and 216 at Pests. The average width of the Danube, in its course through Austria, is stated by Lichtenspern to be 600 feet, and its waterage to vary from 4 feet at Vienna and Ofen in Hungary is 77 feet; and according to Heinrichs, between Ingolstadt (which lies about 90 miles nearly due west of Passau and Pests) it is 813 Parissian feet. The great breadth of its surface is set down by the former as 972 feet at Passau, 690 at Linz, 486 at Vienna, 312 at Pressburg, 258 at Raab, and 216 at Pests. to Littau, in Moravia, between gradually lowering banks; thence it runs through lowlands, where woodland and marsh are inextricably mingled; it joins the Mohel, and leaves Moravia above Hohenau in the northern extremity of the Archduchy of Austria, separates that province from Hungary during the remainder of its course, and meets the Danube at Tisza, a little to the west of Freising. The Tisza is of length about 170 miles through Zungaria, of the Moravian mountains; after it has been joined by the Schwaerts, which crosses Moravia through Brunn from the Bohemian frontier, it is the principal stream which flows into the west of Hungary, takes a south-easterly direction to Stuhlweissenburg, from which town the Sarvis Canal renders it navigable; it joins the Danube on the right bank at Buda, to the north-east of Fünfkirchen.

12. The Theiss, or Ticza, which is the most considerable of the streams tributary to the Danube, and is said to have a greater abundance of fish than any other river in Europe, issues from three springs on Mount Beszten, Bearn, and Pietros, in the most north-easterly part of the Transylvanian range of the Carpathian chain. From two of these springs flow the Black and White Theiss, which unite at its mouth, where the river follows a very tortuous course, chiefly, however, in a westerly direction to Gerersburg and Tokay, and then descends, with numberless windings, and bordered in general by marsh-lands, through the extensive plains of central and southern Hungary, keeping close along the left bank of the Danube until it crosses the Military-Frontier province, and joins the Danube about twenty miles to the south-east of Peterварden. The whole length of the Theiss is estimated by Malchus and others at 740 miles. It has numerous large tributaries: the Bodrog is composed of several mountain streams from the Carpathians, and joins the Theiss at Tokay; the Hermath springs from the Kravola-Hola, in northern Hungary, becomes navigable at Kaschau, and after it has received the Sajo (or Sajaf) and the river Koros, in the course of upwards of 150 miles below Onud, about 28 miles to the south-west of Tokay; the Szagy, in conjunction with the Tarna, comes down from the Matra mountains in the circle of Heves, and forming one stream meets the Theiss near Bratzknez. The Szagy, at the southern extremity of Transylvania, and receives the lesser Szamos at Dees, in Northern Transylvania, after the latter has descended from the western mountains of that principality past Klausenburg; from Dees the Szamos flows in a north-westerly course into the middle parts of Hungary, and thence continues its course, which is above 300 miles in length, until it reaches the Theiss at Oltau, about 60 miles due east of Tokay. The Koros or Korossa is composed of several streams, particularly the rapid, white, and black Korosz, which issuing from the Ore mountains in Western Transylvania, and flowing westwards through the plains of Debrecin and Gross-Varadin, unite in one channel a little below Békés, the capital of the circle of Bekesh in Eastern Hungary; the united stream joins the Theiss opposite to Csongrad. The whole length of the Korosz united stream has been computed at 320 miles. The Maroč or Márco rises on Mount Deethég, south-east of Sz Miklos, near the eastern borders of Transylvania, and flowing northwards, passes the town of Várad and Sziget and falls into the Theiss near Neusiedl, and completes its course of 270 miles by traversing extensive plains until it empties itself into the Danube at Komorn. North of that fortress the Waag receives the Neutra, which flows 110 miles from its source in the Ore mountains between Trebcsan and Neusiedl.

8. The Haus, formed of the White Waag, which issues from the mountain streams of Liptau in Hungary, and of the Black Waag, which springs from the celebrated Mount Kravola-Hola, flows from its junction, east of Sz Miklos, changes from a south-westerly to a south-easterly direction at Neusiedl, and completes its course of 270 miles by traversing extensive plains until it empties itself into the Danube somewhat below Gran; it has its source in the Thracian mountains north-east of Sagh.

9. The Gacs, whose source lies in the Rimas mountains, on the upper plateaux of the Hungarian Ore mountains, skirts the southerly feet of the Liptau range until it reaches Neuscholl, from which it winds to the south and traverses a long, green, level plain to its junction with the Danube at Parndorf, opposite the south-eastern corner of the Grand Duchy of Styria to be 161 miles. The Eppel, or Ipoli, likewise falls into the Danube southwest of Gran; it has its source in the Ohrinsky mountains north-east of Sagh.

10. The Aujta (Ait, or Olj) rises in Mount Locavras, at no great distance from the source of the Marosh, in eastern Transylvania, begins a course of 350 miles by running south to Illyeslara, then flows northward to Hopersc, and thence south-westward in the direction of Hermansstadt, on the Intra-Muntan line of the Austrian province of Hungary, makes a westward bend into the western plains of Hungary, where it is navigable, and then flows, between swampy banks, north-westwards to Raab, near which it falls into the Danube. Its length is about 175 miles, and its average breadth 55 paces.
Rhobenthum, the Gabba, on which Hermanstadt is built. [See Austria.]

15. The Psvka, whose source lies in the Osorina mountains of the Carpathian chain, within the limits of the circle of Marmares in Hungary, flows in a deep valley through southern Galicia past Koloma to Tabornovits, and traverses the Galician frontier, from which it forms the boundary between Russia and Moldavia, until it turns to the south-east and falls into the Dniepeb near Reni, below Galatish.

16. The Sereth, which rises from the northerly branch of the Galician mountain, north-west of the town of that name in the Buckowine, only so far appertains to the Austrian dominions, that it winds round the northerly part of this province, and quits it just above the town of Sereth to pass into Moldavia, through which it flows until it reaches the Dniepeb at Podi, below the westward of Galatish.

The Desnietz does not rise within the Austrian borders. This impetuous river has its source in Lake Mischtscheritz, on the north-eastern side of the Carpathian Forest mountains, and in the circle of Sambor in Galicia. It then runs in a south-eastern direction along the western borders of the Galician plains, winding more to the east as it approaches Zaleszcyz, below which, and until it draws near to Choczew, it forms the boundary-line between Galicia and Poland. The Desnietz traverses on the former kingdom for a length of about 190 miles, but is difficult of navigation from the rocks and shallows with which it abounds. The Desnietz has various subsidiary streams in Galicia.

A large number of the northern dominions of Austria are likewise connected with the Baltic through the Vistula and Oder. The former of these rivers originates in the confluence of the White, Black, and Lesser Vistulas; three rivulets which descend from the eastern parts of the mountain range, in the south-eastern part of the duchy of Teschen in Austrian Silesia, and unite at Vistula, a village at the foot of Mount Tannau. After flowing to the northern boundary of that city, it turns westward, and separates Austrian from Russian territory, until, in the vicinity of Cracow, it quits the Austrian border, below Zabotice, having previously passed between Cracow and Padogorze. So early in its course does the Vistula assume a majestic character, that even Skotshau it attains a breadth of 1700 feet and upwards, which increases to a still greater breadth before it leaves the duchy of Teschen, and from that time it becomes the Vistula. The length of its course through Galicia, and along its frontier, is about 195 miles. Its numerous tributaries form the most important streams in the kingdom of Galicia.

The Oder is not connected with any other portion of the Austrian territory but the northern margraviate of Moravia and Silesia. Its sources lie near the village of Haalisch, about fourteen miles east of Olmitz; from this spot it runs in an easterly direction between wooded meadows to Oderitz in Silesia; hence it soon turns to the north, and meets the Prussian frontier north of Ostrau, where, after receiving the Oppa, which flows along the Austrian-Silesian border west of that town, it continues that line of border until the Elsa (or Oder) has descended from it to the southern extremity of the duchy of Teschen, the capital of which is situated on its banks. It now passes at once into Prussian Silesia, after a course in the Austrian dominions of about fifty miles.

A part of this empire is likewise comprehended within the limits of the river system of the North Sea, by the Elbe, which commences its upper course from the junction of a multitude of brooks, all issuing from the western foot of the Snow cap on the north-eastern frontier of Bohemia, in a valley enclosed by the defiles of the mountains, at an elevation of 4151 feet above the sea. It leaves the mountains at Hohenseeb, descends southerly to Königsgratz in eastern Bohemia, then winds round by the south, and flows westward till it reaches Branderts, twenty miles north-east of Spandower, from thence into the duchy of Teschen, through the northern region of Bohemia to Leitmeritz, and thence to the village of Herrnkreischat, where it crosses into Saxony through the opening of a deep romantic vale, after flowing for a distance of about 160 miles through the Bohemian territory. It has been ascertained that the surface of the Elbe, which has an elevation of 619 feet at Königgrätz, declines to 425 feet at Meining, about fifteen miles north-west of Branderts, and to 320 feet at Schandau, in the Saxon circle of Meissen. This river does not become navigable until it has received an accession of waters from the Moldau, the most considerable of its collateral branches in Bohemia. The Moldau issues from the Black Mountain, one of the Bohemian forest range in the south-east of Bohemia, becomes navigable at Budweis, flows through the heart of Bohemia to Prague, and, after a course of more than 400 miles, falls into the Elbe a short distance to the south of Meining.

The Rhine, another great branch of the river system of the North Sea, forms part of the western boundary between the French and Switzerland, and falls into Lake Constance at Bregenz, after it has, in the former, received the Ill, which flows into the Rhine at Feldkirchen.

In the river system of the Mediterranean are comprehended the streams which discharge themselves into the Adriatic. The Po is the only large river whose outlet is in the Austrian dominions. It first touches Lombardy between Casale and Pavia, where it receives the Ticino, and, bearing its slow and turbid current eastwards, with a slight inclination to the south, for about 190 miles, it traverses the provinces of Venetian and Modena and Parma and the States of the Church, until it falls into the Adriatic; the only exception to this remark is the territory of Mantua, which lies upon its right bank between Luzaia and Biella, and renders the Po a purely Venetian river for a distance of about 60 miles, where it forms the frontier between the Papal and Venetian territories. Its surface throughout nearly the whole of this course is at a greater elevation than the land through which it flows. It is in a state of fresh embankments which wall in its waters; they are insufficient to prevent the overflow of its Alpine tributaries, from bursting over them in the spring and autumn, and creating those numerous swamps and marshes which line it at various points, and extend nearly a mile in breadth. It breaks through the Adriatic outlets: neither is it falls, which does not exceed twelve inches in each mile, calculated to mitigate its devastations. The largest of its subsidiary streams bounding Lombardy, and have their influx on its northern banks. The Po and the Ticino enter the Lago Maggiore at Sesto Calende, marks the westerly line of frontier next to Piedmont for about seventy miles, throughout which it is navigable, and falls into the Po with a somewhat rapid descent. It is not far from the Po that the sources of the Olona, which rises among the Alps near Vedano, in the Austrian territory, between lakes Lugano and Varese, flows through Como and Milan in a south-eastern direction, and discharges itself below Corto Olona, about two miles north of the town of Placentia, it bounds the eastern extremity of the Lago di Como, directs its course past Monza, east of Milan, and meets the Po at Coklo Est, below Placentia; it communicates be-nal from Cassano with the Adige, and by river from Milan with the Olona: the Adda, a considerable river, abounding with fish which, after entering the Lago di Como from the Valalwine, quite it as a navigable stream at its eastern extremity to the south-east of Cassano and Lodl, into the Po below Putzhettem, to the west of Como; its waters are increased by the Serio and some minor rivers: the Oglio, whose source lies in the upper opening of the Val Camonica, in the most northerly district of Lombardy, flows southwest to Iseo, and then, in a south-eastern direction, receiving the Melia and Chiese in its course, and passing through Calco, Pontevico, and Ossiano, it falls into the Po below Gassanardo and the Monz or Mens, which runs under the name of the Serio from the large Lago at Lovere, and the Mincio, Riva and Arco, issues from it at Peschiera, where it assumes the name of the More; directs its course southwards to Mantua, expanding into the lake, at the eastern end of which that fortress stands, and discharges itself into the Po near Verona, in the full breadth of its course.

The Adige (or Etsch) is next in importance to the Po in the Italian possessions of the house of Austria. The whole length of the Adige is estimated at about 220 miles. The Passer, Alpe, and Adigevo also fall into this river.
The other streams in this quarter of the Austrian dominions which flow into the Adriatic, such as the Brenna, Pave, &c. will be noticed in their proper places.

The Canals which exist in the Austrian dominions are of limited extent, and merely local in their advantages; for their object in general is merely to facilitate the communications between one part of the district and another. Their whole number is not more than five-and-thirty; and their entire length does not exceed 600 miles (107 German miles) at the utmost. The largest of them, the Bega, or Temes Canal, was the work of the Romans, and is an artificial channel, into which the Bega has been conducted from its old and winding bed; it runs nearly in a straight line of seventy-four miles, from Faksat to Becakerek, through Temeswar, in the south-eastern part of Hungary, and the river Siret. Another important canal in the same kingdom is the Emperor Francis's Canal, which unites the Danube and Theiss, and, by saving a circuit of about 220 miles, reduces the communication between these two rivers in the south of Hungary from two or three weeks to two or three days; it opens below Belzina, and joins the Theiss below Belnà, about twenty-four miles north-east of Ploestiarden; its length is sixty-seven miles; its breadth is sixty feet, with a depth varying from four to six feet, and it is provided with five sluices. The Naress, Alburnis, Argosy, and Sora Canals, likewise in Hungary, are of little further use than to drain off the waters in the lowlands. The Yaraiça in Slavonia is the remains of an old Roman canal, which it is intended to superpose; and the Schwartenzenburg in Bohemia is only fit for floating down timber, &c.

There is a canal also between Vienna and Neustadt, called the Neustädter, which is thirty-seven miles in length, and which is in contemplation to carry through Versain to the right bank of the river. The other principal canals in the Austrian territories may be in canals, the provinces of Lombardy and Venice abound in them: the Naviglio Grande, about thirty-seven miles long, issues from the Naviglio through Abissinian to Milan, with its branches, the Bereggano and Pavia and the Arno, are the principal. Of these the six miles, commencing at Milan, and terminating on the right bank of the Adda, unites with capital with others; the Commum is the Adda above the Adda; below the Po is near about two by two or three miles, and terminating on the right-hand side, it unites with capital with others; the Adda is about twelve miles, and unites with the Oglio; the Lombardy and Venice are likewise full of canals, which answer the useful purposes both of irrigating the circumjacent lowlands and draining the marshes.

Cultivation of the Soil and its Products.—The variety of soils within the Austrian empire is perhaps not equalled by any other state in Europe. But there are few portions of soil in which the liberty of nature has hitherto been adequately succeeded by human skill and industry. This deficiency has, in one branch of cultivation at least, been caddied as a disadvantage, as well as felt; both government and people have considered these lands to be mere waste land, and before the state of agriculture can be raised to a level with the advance which it has made among most of the inhabitants of western Europe. Their first attention has therefore been directed to the improvement of those districts, and the foundation of the Austrian universities. It is not our business, however, to speculate on the probable effect of these measures, but to speak of the extent to which cultivation has been carried in the Austrian dominions. With this view, we shall avail ourselves of Lichtenstein's statements, of which the general accuracy has been universally admitted. It appears, then, that the cultivable portion of the 85,526 square miles, which constitute the area of those dominions, may be estimated at 293,400, of which 288,573 are occupied by about 81 parts in every 100 of the entire area, or 87 parts in every 100 of the cultivable portion, have been rendered available. This extent of available surface may be thus distributed:—

<table>
<thead>
<tr>
<th>Type</th>
<th>Square Miles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arable land</td>
<td>288,573</td>
</tr>
<tr>
<td>Gardens</td>
<td>3,047</td>

<tr>
<td>Grazing land</td>
<td>18,530</td>
</tr>
<tr>
<td>Forests and woodlands, &amp;c.</td>
<td>73,229</td>
</tr>
</tbody>
</table>

From this estimate it would seem that the quantity of surface, either unproductive or not yet turned to any account, does not much exceed 18 parts out of every 100 of the whole area. This extent of 18 parts in every 100 of what is estimated as the cultivable portion of it.

When describing hereafter each subdivision of the Austrian territories, we shall have occasion to notice the respective proportions of cultivated or otherwise productive soil which appertain to it; in the mean while we may generally observe, that the proportion of that soil with reference to the surface of each subdivision may be stated, for

This glance at the actually producing extent of the Austrian soil naturally leads to a consideration of the species and quantities of products which are derived from it, whether vegetable, animal, or mineral; and here the first object of our attention is to state, and of inquiry to an intelligent observer, is the proportion which the cultivation of grain bears to the number of human beings, whose existence depends upon an adequate provision of this first necessity of life. Unfortunately, at the time of such an inquiry, we are called upon to contend against the want of special and authentic data; a want which will more or less embarrass us in every stage of our subsequent attempts to ascertain the actual quantities of any other article which Austria produces. This circumstance has given rise to the most discrepant estimates of the annual growth of grain in the Austrian dominions: Lichtenstein, for instance, assuming it to be but 38,134,000 quarters, Blumenbach upwards of 43,840,000. Stein 45,620,000, Hassel 76,300,000, and some more recent writers as high as 93,800,000, and upwards. Of those, however, who have given their attention to the subject, Malchus appears to us to have handled it with the greatest degree of discrimination; and it is his opinion, that, looking at the present state of husbandry and the uniform system of cultivation which is prevalent throughout the empire, with very trifling exceptions, it is safe to estimate the gross quantity of grain produced at 82,070,000 quarters, from which 7,820,000 being reserved and deducted for seed corn, there will remain a surplus of 64,250,000 for consumption or export. He likewise computes the gross produce to be composed of 38,080,000 quarters of wheat and rye, and 43,990,000 of barley and oats; and calculating the average yearly consumption of the people for the individual to be about one-quarter, he considers the whole domestic consumption of bread corn to amount to 33,280,000 quarters, leaving a residue of 40,800,000 applicable to other purposes. The largest quantities of these four sorts of grain are raised in Hungary, Galicia, Bohemia, and Moravia;
and Venice (where every available acre is judiciously cultivated); but these are parts, each, of the three great spheres of Hungary, Upper and Lower Carniola, Transylvania, the Tyrol, Silesia, and a few others, constituting about one-fourth of the whole territory of Austria, which do not grow sufficient for their own consumption. This remark attains also equally to the province of the Lower Enns in the archduchy of Austria, where, however, the subsistence of the metropolitan population alone creates the necessity of a large importation. This province and the Upper Enns enjoy the reputation of producing the finest wheat in the empire. In 1845, it is said, it was more than double the annual average, and more oats than barley. Besides these descriptions of grain, a very considerable supply of maize, amounting to 5,100,000 quarters yearly, is raised in various parts, particularly the south of Hungary, the Bukowina, the Danubian Lombardy, and Venetia; the last-named kingdom likewise produces from 131,000 to 142,000 quarters of rice, independently of 4400 to 5500 more grown in the marsh-lands of Temeswar, Slavonia, the Military-Frontier districts, Dalmatia, and other provinces in the south. It has been estimated, indeed, that the growth of these several substitutes for wheat and rye increases the annual produce of grain adapted for human subsistence to 41,400,000 quarters. Buckwheat, millet, podded grains (such as flax, hemp, etc.), barley, turnips, and other ordinary vegetables, are more or less cultivated in almost every part of Austria: nor is there any want of an adequate supply of fodder for horses and cattle, the growth of which is very necessary for the breeding of Bohemia, Slavonia, and Transylvania, under the name of the ruja, and is largely employed in some of the processes of dyeing.

The principal medicinal plants cultivated in Austria are—
rhubarb, which is raised in Styria, the Lower Enns, Bohemia, and Galicia; liquorice, a favourite article of growth in Moravia, whence 4000 tons and upwards are annually exported, and which is also gathered in the wild state in Hungary and Slavonia; manna, derived from the Prunus ornata, is cultivated in the Bukowina and Transylvania, and spikenard (Spicata Cetnica), which is collected with much care in the mountains of Carniola, Styria, the Tyrol, and the Upper Enns. The white species of this plant is mostly exported to the Levant, where the natural approach of the sea to the banks of the river has always been the scene of the commerce by which they conceive to be its invigorating properties. A brandy spirit is distilled in Carinthia and Styria from gentian, which is found in most of the elevated regions; and Iceland-moss is collected on the mountains of Carniola, Slavonia, and Transylvania. Whole forests of plums and damsons are to be met with in Hungary; and 10,000 acres of land are devoted to the produce of the former alone in the kingdom of Dalmatia. Besides the production of corn and other grains, Malvaceous manufactures above 600,000 gallons of Araratia (or Rahy), a brandy, extracted from the plum and damson, which is a favourite beverage among the Slavonians, and is also made in the Archduchy and Hungary; absinthus, figy, and essences, are produced in Dalmatia and Locris Magna; ivy, and other species of the southern provinces; some few of the northern provinces also produce the former; currants and raisins are exported from Dalmatia and the adjacent islands; and the graveola, pomaceanus, lime, lemon (which is extensively grown in Hungary and Moravia), orange, date, and also, are natives of some of the southern and south-eastern provinces. In these parts the olive is likewise cultivated largely; the best grow near Calata, and the district of Treia in Dalmatia, in which vernality prolong the produce of oil amounts to 30,000 or 31,000 barrels annually; Istria also manufactures about 30,000 barrels a year; but the production of this article is not at all adequate to the consumption of the empire at large. Meanas are extensively cultivated in Lombardy, Venice, and Hungary, but grown as a garden-fruit only in other parts of Austria. Hungary indeed has been called ‘The Paradise of the Melon.’ In that country, the fruit is raised both in the open field and garden, and eaten by all classes, of whom the first use the water-melon, which succeeds best in sandy soils.

We have seen that more than one-third of what is deemed the available soil of the Austrian dominions, is occupied by woods and forests; it is equal, indeed, to a fourth part and upwards of the whole area. The existence of this, or any natural occurence, that wood must constitute one of the staple productions. The more level district grow the oak, beech, ash, alder, elm, poplar, lime and linden, beech, and pines, whilst the fir, pine, larch, cedar, and yew, and, where these are not naturally grown, can be introduced, seek the more elevated regions. The Bohemian forest in Hungary, which is above fifty miles long, and from ten to fifty and twenty broad, and the Dragomanish in Illyria, as well as the forests of the Bukowina, Slavonia, and Dalmatia, abound in oaks of extraordinary dimensions.
and would afford inexhaustible resources to a state like England. The following details from Liechtenstein will however convey a more correct idea of the extent of the forest lands than any general remark. He states the woods and forests of Hungary to occupy a surface of 5,442,748 yochs; of Transylvania, 4,492,900; of Galicia, 3,858,811; of the Austrian states, 4,811,273; of the Austrian Crown lands, 2,172,793; of the Archduchy of Austria, 1,827,009; of the Tyrol, 1,508,680; of Styria, 1,507,214; of Lombardy and Venice, 1,465,460; of Illyria, 1,539,461; of Moravia and Silesia, 1,139,282; and of Dalmatia, 633,100; making the total of the forests of 36,755,900 yochs, or 44,530,000 acres. With respect to fuel, we have no means at hand of ascertaining the quantity of wood felled for its supply. The neglect of the forests, particularly in the mountainous parts of large towns, has become so crying an evil among the inhabitants of these regions, that a general attention has been roused to the subject, and much pains are taking to prevent the recurrence of a deficiency of fuel, by fresh plantations, in which Prince Liechtenstein has set a most useful example, above two millions of American trees and shrubs having been added to the woods on some of his estates in the Archduchy and Moravia. Among the products of the Austrian forests we may name potatoes, which are chiefly made in Hungary, Galicia, and the following states, and also in Bohemia. The Hungarian potash, of which about 1500 tons are produced, stands in highest estimation; the supply from Galicia, and from the Buckowine, where Buckowine is usually in a barren condition, and there are upwards of 600 manufacturers of the article in Bohemia, who produce 500 to 900 tons a year for exportation, besides supplying its domestic consumption, for which nearly 3500 tons are required. Moravia is also a considerable exporter of potash, and there is a sort made at Deutscherbrorof, in the Archduchy of Austria, which is said to be superior to any that is produced elsewhere. In no other province is this branch of manufacture carried to such a great extent; charcoal, gall-apples, and tarpentine should be added to this enumeration of the products of the Austrian forests, though they are not of considerable moment: that of tar, for instance, not exceeding 300 tons; that of gall-apples being not more than 8000 in yearly value; and that of tarpentine not exceeding 1000. The quantity of sawn annually made in the Austrian territory averages between 370,000,000 and 600,000,000 gallons. Of this produce, Hungary contributes 370,000; Lombardy and Venice, 85,670,000; the Archduchy, 36,000,000; Tyrol, 13,500,000; Silesia and Bohemia, below fifty thousand each; and Dalmatia, 70,000,000; Hungary, 70,000,000; and Bohemia, 45,000,000. The quantity contributed by the inhabitants themselves is estimated at about 40,000,000 gallons in Hungary, 35,000,000 in Galicia, the climate, as we have before remarked, being unfavourable to the cultivation of the vine, nor had any been made in the adjoining province of the Buckowine since within the last few years. The 'King of Wines' is a native of the Austrian soil: it is the produce of a district not much more than one hundred square miles in extent, situated on the high grounds of Tokai and Targac, which form part of the Heggulja range of the Carpathians, in the circle of Zempin, in north-eastern Hungary; and it is somewhat remarkable that the generous grape, from which the several species of Tokai are made, should ripen to such perfect sweetness as to be wholly devoid of acid at so high a latitude as 46°. The Tokai, Targac, and Mada sorts are eminent for their excellence, and are produced with the most delicate sweetness. In point of body, the Talis and Zambor sorts are preferred. Next to these, in the list of Hungarian wines, stands Rendszbach, a strong, sweet, and aromatic liquor; and the Ausbruch, or first quality of the Oeschenin, is also in demand among those who prefer a less powerful wine. The vineyards in the neighbourhood of Ofen also yield a wine of astringent quality, which is frequently substituted for Burgundy, Slavonia, Croatia, Transylvania, and the Austrian rivers in general. However, much would probably be deemed very little inferior to the best Hungarian or Rhenish. We know of no sparkling wine in Austria excepting that which is brought from the valley of Vinodol, in Croatia. The wines of Zemljanac, of Sopron, as well as the delicious Marsenam del Teocio, are produced in Dalmatia; but there are none of marked excellence made in the Italian provinces. The whole exports of this article from the 4 Austrian dominions are estimated at about 75,000 tons, a large amount of wine for so extensive a country.

Having thus pointed out the leading productions which characterize the vegetable kingdom in the Austrian Empire, we will now direct our attention to the resources with which the animal kingdom has supplied it. And here we shall again have recourse to Liechtenstein, who possessed sources of information to which few other writers on the subject are said to have had access. He tells us, that the domestic and more useful kinds of animals, of which the whole Austrian stock is composed, presents a large and important subject for a separate investigation.

Horses (including one to three year old foals) 1,800,000 to 1,900,000; mules and asses, from 60,000 to 70,000; horned cattle (including one-fifth for the young), 9,000,000 to 10,000,000; and the greater part of the improved breeds, 16,000,000 to 17,000,000; swine, 5,000,000 to 6,000,000; goats, 800,000 to 900,000. Blumenbach estimates the number of horses as high as 2,200,000; and of the sheep, at 15,000,000 or 20,000,000, among which are some few of the Dukshley and New Leicester breeds, introduced in 1825.

Malchus, a subsequent and very recent writer, has likewise investigated this subject with much care; and we give in the annexed table his estimate of the number of each species, to facilitate the comparison between the provinces.

To this statement it may be added that the proportion of oxen to cows is estimated as being that of 7 to 12, and the whole number of mules and asses at between 58,000 and 59,000. With respect to the horse, the finest breeds are reared in Transylvania and the Buckowine; they are well formed, and of Turkish descent: the Hungarian, on the other hand, are of slender make, and common to the greatest plains; but they are a swift and durable race of animals. The Galician breed, with the exception of the few of Polish blood which are bred in the circles of Zlocsof and Brzany, are still more diminutive in size, and in general trained from a wild state, but they are remarkably hardy, as well as swift-footed. The Bohemian and Moravian horse is principally adapted for agricultural purposes, whilst the breed reared in the Archduchy, Styria, and Carniola, are of strong and powerful make, fitted for private use and military service; but the stock of the latter is by no means abundant. In fact, the supply of horses in the Austrian dominions is so inadequate to the demand, that they are compelled to resort to Naples, Halleckburg, and even our own country for carriage-horses, as well as to various parts of Germany for remounts for the cavalry. The immense studs, which the government maintains in Hungary, Galicia, the Buckowine, and other quarters, where thousands of the most useful animal are reared, have been contributed to replace the deficiency occasioned by the destructive succession of wars out of which Austria is emerging. Lombardy takes the lead in supplying mules and asses, and conjointly with Venice, they furnish a considerable portion of the working horses of 48,000 and 49,000 of them, above four-fifths of the whole Austrian stock. The mules of Illyria and the Tyrol are larger, stronger, and handsomer than the ordinary race, and as swift as the fleetest horse.

Of horned cattle, the chief breeds are reared in Hungary, Transylvania, Lombardy, and Styria; those of the first two countries are remarkable for their size and handsome horns, as well as the quantity and quality of their flesh; the Lombardy breed is by cattle of very small size and strong make; the Styrian breeds are the same large, long, bodied, crumpled-horned, short-legged race as the Carin.
AUSTRIA

An abundance of other poultry, is almost common in Bohemia, Galicia, and Hungary, in which quarters the Jews have contrived to monopolize nearly the whole traffic in down and quills. The pheasant of the finest Austrian breed is a native of the first-mentioned of these three kingdoms, though this bird abounds equally in all of them. The Tyrol is celebrated for the number of herds between 3000 and 4000. In value are annually sold, and some even in the markets of Constantinople. Game of all kinds is plentiful in most parts, and on the list of wild animals we find the bear, lynx, wolf, weasel, and stoat.

The breeding of sheep has in most parts been followed up to the injury of pastures. In Bohemia, Moravia, Silisia, and the lower Rus, a very marked improvement in quality, arising from the cross of the native breed with the Spanish Merino, has more than counterbalanced a trifling decrease in quantity. But there is no part of the Austrian dominions equal to the east of Hungary and to Transylvania for the extent of their flocks and pastures. Hungary, indeed, possesses so much larger a supply than is necessary for its own use, that there have been years when the exportation of half a million sheep and goats, independently of upwards of 170,000 lambs and 1,400,000 lbs. of wool. The latter, which is chiefly obtained from the common Hungarian race (Ovis aries), a breed with long twisted horns, and long shaggy coat, not found in Austria, and nowhere more productive of the best Merino-wool, Mount Ida and in some of the Greek islands, is but of coarse texture. In the western and southern parts of Hungary the breed has been improved by crossing it with Merinos, and now yields its fleece in much greater quantity. The sheep is carried to the markets of Sofia, where it has much increased its flocks during the last thirty years, and greatly improved them by mixing them with Merinos; its stock, which amounts to 375,000 only in 1807, has now risen to nearly 500,000. In the east of Lombardy, the Venetian territories, Dalmatia, and the Quarnasco islands, where the Paduan breed is reared, an excellent quality of wool is also obtained. On the whole, Austria does not, however, produce as much wool as the consumption of her manufactories requires, and therefore must make a large importation from Turkey and other countries. Her native supply has been estimated at 474,000 cwt. per annum; namely, about 10,000 of superfine, 970,000 of fine and middling, and 170,000 of coarse qualities. We should add, that there are five distinct races of sheep bred in Austria—the Hungarian, also called the Zschekelschaf, which we have just described, the common curly-coated sheep, the improved breed, the Paduan, and the pure Spanish or Merino species.

The rearing of goats is carried to so great an extent in some of the mountainous districts as to materially affect the general supply upon which the indigenous animals are fed for the sake of their milk. The Tyrol and Bohemia; but the government are anxious to diminish the stock on account of the injury which they do to young plants. 

Cows are kept in large herds throughout almost every province of Austria, particularly in Hungary, where the flesh is so favourite a food with the Magyar and Slavonian, that in some years two millions have been known to be slaughtered, besides 250,000 exported. They are mostly kept in the mountains or on the higher pastures, and beeches, at a distance from dwelling places, being driven up to pasture upon heaths in summer, where they feed on roots, snakes, and other reptiles, and in forests or other feeding grounds in the beginning of October. The markets of Dobrudia and Oelwillenburg, in Hungary, are unquestionably the largest markets for swine and lard in all Europe; it is said indeed that 'an Hungarian would die without lard, as surely as a German without coffee.' In the northwestern parts of Hungary, too, pasture is bred in such large quantities that a great portion is sent from there to Vienna without encountering flock upon flock of fowls, ducks, geese, and turkeys. The same may be said of the districts around the Austrian metropolis, and indeed more, of the large每每 Prince within convenient reach of large towns. (Sopron, etc.) and the herds from Sopron to the latter are the ordinary domestic fowls of the Transylvania. The wool of geese in Lombardy, where there is
article of export from Hungary and Slovakia; the cochineal insect draws many purchasers into the sandy tracts of Galicia from Turkey and Armenia; and the leech of late years has become an article of considerable trade between Austria and France.

Production. Austria surpasses every other country in Europe. With the exception of platinum, it would be difficult to name any metal which it does not possess. The richest of its gold-mines are in Transylvania, which has been called 'the gold-mine of Europe,' and which has four smelting-works with productive being at Voroschach, Sistalba, Fasabae, and Nagy-Arg; the annual quantity of pure metal which the whole yield is stated to be about 30,000 ounces. The gold obtained in Hungary is partly found in a pure state, but the greater part is obtained from copper ore; the mines of Lower Hungary produce about 20,000 ounces yearly, and those in the north-western districts about 1,200. There is a mining academy at Schemnitz (or Belomest-Banya), in the heart of the latter, which has greatly advanced the science throughout Austria, and become the resort of many foreigners who are desirous of studying it. The remaining produce of this metal, in the circle of Salzburg, the Tyrol, and other provinces, including the dust containing valuable metals, which there are in the mines of Saxony, Buda, &c., is estimated at more than 2,400 ounces; so that the total quantity of gold annually accruing to the crown is about 60,000 ounces, the gross value of which may be estimated at 26,400,000 florins, but which should be considerably less, for that gold found in the Austrian dominions is the property of the sovereign. Hungary possesses the richest of the silver mines, in which the mountains about Schemnitz and Nagy-Banya are most abundant; the whole supply annually derived from them is about 2,400,000 ounces, of which nearly three-fourths are from the Schemnitz district. The other parts of Austria which produce this metal are Transylvania, about 30,000 ounces; Bohemia, particularly the mines at Prisbaun, in the circle of Breslau, 155,000; the Bukovina, 22,000; Hungary, 10,000; Galicia, 4,600; and Salzburg and the Tyrol, about 4,000. The decline in the richness of the veins which were worked on Mount Trent in the province of Vicenza, and at Enna in the island of Sicily, of the mines of Lower Hungary, which occasioned them to be almost abandoned of late years. It would appear, therefore, that the annual produce of the silver mines is between 1,200,000 and 1,100,000 ounces, and their value is estimated at rather less than 200,000 florins. No part of the empire either is so rich in copper ore, or yields so large a supply of the metal, as Hungary: its most productive works are in the mining district of Schmölzits, or Szomolnok, where they employ between seven and eight thousand hands, and yield full two-thirds of the supply from the European mines. The ore is smelted into sulphate of copper, or 'cement water,' which the Zips brings down to Schmölzits, and of which instances again occur near Neusohl in northern, and at Jaskea in south-western Hungary, is too remarkable to pass unnoticed. The mines near the Danube, and near Budapest, and above those parts are saturated with sulphate of copper, which is precipitated on all iron thrown into them; in this way from 1600 to 1700 cwt. of copper is extracted from them every year. The copper works at Deva and Sisendomoces in Transylvania produce about 2500 cwt. per annum; the Styrian, 1900; the Illyrian, 1000; those of Galicia and the Buckowine, 2000; the Tyroese, 1200 to 1500; and the Dalmatian and Istran, 1600. On the whole, the annual supply of copper which is raised in the Austrian dominions, and which approaches 17,000 tons, or 2000 cwt. per annum. At least double this quantity of lead is produced; and above one-twelfth of it, namely, between 1750 and 2000 tons, proceed from the Styrian (lead mountain), Königsberg, and other mines in Carpathia. The Hungarian ores are, in value, the average per annum, about 1900 cwt.; and to these may be added 1100 from Bohemia, 250 from Transylvania, about 35 each from Salzburg and the Buckowine, and 50 from Dalmatia, Istria, and the maritime districts. The use of lead is very extensive, and they produce annually about 1800 tons; and these are not all waste. The quantity produced throughout the empire is about 2200 tons, and of this the supply of the country is about 950 tons, or 1200 cwt. per annum, and of this quantity nearly one-half is derived from Styria, Carnithia, and Carinola alone, the former produce about 83,500, and the latter two about 32,500. The most productive of the Styrian mines is that which lie between Eisenstadt and Vordenberg, and yield upwards of 14,000 tons, and those at Neuburg and Gabrath, which have been known to yield above 5000; the remainder supplied from fourteen other works in that province. Its iron is as well as its copper of Carinthia, and also of Styria, and at the same time one of the richest, iron mines in Europe, its product being from 8000 to 9000 tons a-year. The circles of Beraun, Rakonitz, and Plzens, in Bohemia, are also rich in this metal, of which the whole kingdom furnishes about 18,000 tons. The greater part of the iron obtained are Moravia and Silesia, in all about 30,000 tons; the Archduchy, between 1500 and 2000; Galicia, 2000; the forty-four works in the Buckowine, 450; Transylvania, 850 or 900; and Hungary, particularly in the circles of Komor, Liptau, and Solh, where the best of its iron is produced, and the first of which supplies 5000 out of the 7000 tons raised in that kingdom. The mountains of Lombardy lying within the territory of Brescia, Bergamo, Como, and the Valtelline, which contain, besides two of seven high-blast furnaces, are also estimated to produce from 5000 to 10,000 tons a-year, a considerably proportion of which is made into cast-iron. This is raised in no part of which a product is 10,000 tons, or 2000 cwt., which is far short of the consumption. The quality, however, is good; and indeed that which is obtained from the Schlaekenwalde mines, in the circle of Eilenbogen, is said to be equal to the best Cornwall tin. There is no mine of pitchblende in the empire, but which supplies iron for thirty-niola, the produce of which has, however, gradually declined from 12,000 cwt. a-year to its present amount, which is not above 4000; about 60 cwt. are also obtained from the Zaslauh works in Transylvania, and 840 cwt. more from the mines in Bohemia, and 8000 cwt. from the mines of Moravia, and about 200 cwt. of iron from Hungary, Transylvania, Bohemia, and Salzburg; and between about 6000 cwt., of which 2000 from the mines of Rosanau in Hungary, and the remainder from Transylvania, the Tyrol, and Bohemia. Chrome is got in the Tyrol, and about 700 cwt. of bismuth, and 800 of manganese, principally in Bohemia.

The various species of salt, such as sea, rock salt, and that made from brine-springs, exist in abundance. The second species is abundant on both sides of the borders; but there is also a species of Wieliczka, which has been worked over since the year 1253, and lies in the north-western part of Galicia, but is an inconsiderable scarp upon a massive bed extending for a length of nearly eight miles along the course of the river Pruth. Of its yearly produce, which amounts to 35,000 tons, three-fourths are composed of what is called 'green-salt,' salinio sól, a kind that abounds in mineral particles; the next kind, saylikowa sól, or 'shaft-salt,' is much purer and whiter; but the third, ockowala sól, or 'crystal-salt,' which is perfectly pure and transparent, is the quality used for the table. This, and the neighbouring mine at Bochnia, which yields about 12,500 tons per annum, is said to produce a net revenue of least 80,000; and the whole quantity of salt of all kinds raised in Galicia and the Buckowine is estimated at 82,500,000 tons, which includes 15,000 of remarkably white colour and fine quality, obtained by the process of boiling. The mines and boiling works in the archduchy of Austria, which is situated at Halenlin, Ebenose, Ischel, and Hallstadt, with those of the Salzburg, near Aussee in Styria, and at Hall in the Tyrol, yield a further supply of between 78,700 and 79,000 tons, which is extracted from the twelve mines in Transylvania, and 34,000 chiefly from the six rich mines of the circle of Marcarow in Hungary. Bay-salt, too, though to the limited extent of 30,000, is supplied from the salt-pits along the coasts of Danzig and Istran, and in the islands of the Adriatic. The annual quantity of salt, therefore, which the Austrian territory produces, appears to be about 375,000 tons, the whole of which is the produce of
A government monopoly of the most profitable kind; a de-
scurity, however, of between 20,000 and 30,000 tons still
remains to be imported for the consumption of the southern
provinces. Of vitrile, Austria raises about 10,600 cwt,
almost wholly in Bohemia and Illyria; alum, about 11,500
cwt., in the proportion of 1000 to 5000 of the Bohemian; 6600 from
Lechbach, and 2300 from Hungary; saltpetre, about 350 tons, of which 340 are made at the
government works in the east of Hungary, whence an
almost unlimited supply might be obtained; and soda, which
appears to have been obtained only from the vicinity of
the circle of Bihar, where above 10,000 cwt. of the purest
quality are frequently obtained in the course of the year.
The saline miasces of that kingdom likewise furnish an
abundant supply of the finest sort of sulphate of soda, or
Glass, as salts.

Although the forests furnish nearly the whole of the fuel
which is consumed in the Austrian dominions, there is
scarcely a province which is deficient in coal. At present,
however, the whole quantity raised is not estimated at
a higher value than 60,000 l., and scarcely amounts to
100,000 tons, which are obtained in the following proportions:
from the Archduchy, at the mines near Wiener-Neustadt,
10,000, and from four others in the Upper Ena, about 5000;
from Lower Illyria, and the valley of Soča, 25,000;
Styria, 15,000; from the Tyrol, 10,000; from Moravia, 10,000;
at the mines near Rossat, where excellent coke is also made;
from Hungary, chiefly the Odemburg mines, 28,000; and
from Galicia, 17,500. The remainder, about 25,000 tons,
is raised in the valleys of Leitha and the Dour, the districts
of Krems, and Brescia, and other parts of the kingdom of Lombardy and
Venice. And we may here incidentally remark, that not-
withstanding the abundance of pest or turf which is found in
the provinces of Styria, Galicia, and in the Archduchy of Hungary, and Galicia, this substance is nowhere used as
fuel in any quantity but in the first three of those provinces,
where, however, it is mostly employed in manufacturing
processes. Every part of the Austrian dominions possesses
materials for the production of coal and iron, although,
generally tar and oil are chiefly obtained in Galicia and the
Bukowine, where the country-people denominate them
'roppa'; but they are also produced, though but partially
turned to account, in the Archduchy, Hungary, Bohemia,
Illyria, and Dalmatia.

Among previous stones, the Bohemian carbuncle and
Hungarian opal stand in highest repute. The former, particu-
larly the carbuncle or garnet found in the circle of Leit-
menitz, is equal in quality to the superior Indian in colour,
as well as in hardness, to the oriental stone; it is a produc-
tion, also, of the Lower Ena, Hungary, and other
mountain districts in Austria. The latter is procured of the
finest quality from the opal mines on the Pecklen domains
in the circle of Branden, which occupy a surface of nearly
130 miles; inferior kinds are found in Transylvania, Mo-
ravia, and the Lower Ena. The chalcedony, ruby, emerald,
jasper, amethyst, topaz, carnelian, chrysolite, and beryl, as
well as all that is called the 'diamond' in Hungary,
must be added to the list of Austrian precious stones.
Marble of every description and variety of colour and vein
is raised either in Hungary, Transylvania, Bohemia, the
Archduchy, Tyrol, Styria, Illyria, Dalmatia, or the Italian
province Venetia, in which the most remarkable are said to possess 106 distinct varieties. Carnithia and Styria,
indeed, supply a quality of white marble no way inferior to
the celebrated 'Bianca di Carrara,' that of Nico freelance,
an island in the Dalmatian coast, is equally repute. Alba-
lino, too, is of common occurrence in various parts of
Austria. Marble, finest being a product of the Salzburg and Galician moun-
tains; the serpentine, black tournavine, and other valuable
substances of this class, are found both in the German and
Italian territories. The Archduchy, the Tyrol, and Styria,
considerable beds of graphite, or black
leath, of which only one is worked, exist in the Lower Ena,
and it is a product likewise of Moravia, Hungary, and
Transylvania. The best slate in Austria is found at Vranško,
least economical and of the finest quality of any in
which the whole area is supplied. The Styrian
gneisstones are of a much inferior quality to those which
are obtained from the quarries at Bergamo, and exported
to the United States and England. Bohemia, Styria, and
the Upper Ena, as well as other parts of Austria, produce
excellent alumines and silex for the manufacture of china
and earthenware; indeed, the porcelain made in the imperial
manufactory in Vienna, for which the material is procu-
ered from Engelskardzell in the Upper Ena and Passau, is
considered superior by many even to the Sèvres or Berlin
china for purity of colour and durability. The meerschaum,
of which the highly prized heads of tobacco-pipes are made, is
a product of Hungary and a part of Bohemia; and the
Krumau in the former province is esteemed equal in quality
to the Kiltshikoran of Anatolia. Neither is Austria any-
wise deficient in clays, stone, earths, or such other mineral
substances as are adapted to the use of the potter, builder,
and painter.

Every part of the Austrian dominions abounds in mineral
waters, and it is said that 1500 distinct springs may be
enumerated. Among the 150 which belong to Bohemia,
none enjoy so mineral a repute as the waters of Carlsbad,
Toplitz, and Eger, the last of which possesses acridulous
springs scarcely equalled by any others in Germany. The
waters of Bulin, precisely similar to the Seiler, the ferti-
ginous springs of Lichwenda, closely resembling those at
Boppard, and their neighborhood, and the springs of Renn,
a salt as much esteemed for its medical qualities as the
Epsom or Cheltenham, are all within the Bohemian borders.
The adjacent province of Moravia is likewise full of mineral
waters, and numbers of invalids from distant countries resort
there for the power of the medicinal springs, the
superb waters of Silesia. The scalduous waters of Robuch, near Clyly
in Styria, have, from their sparkling character and agreeable
flavour, acquired universal favour, in Italy especially, where
whereof the Archduchy of Hungary, no less than 320 mineral springs are said to have been already
discovered. The most esteemed springs in this
kingdom are at Bardiński and Fürst, and partake of
the same qualities as the Fymont water. The famous Her-
cules baths of Baden, as well as those of Reutlingen and
its sulphurous springs in the Hungarian division of the
Military-Frontier districts: but the recollection of their former
glory has not been sufficient to preserve them from entire
neglect in modern times. Transylvania also has an
abundance of mineral waters; in this, as in Hungary, there are several, of which little account is made, with
the single exception of the warm sulphur springs at Baden,
about twenty miles south of Vienna, with whose nobles and
loungers it becomes a favourite place of summer resort.
The alkaline steel springs of Dorna-Handri in the Buck-
owine; the acridulous waters of Krynița in Galicia; the
warm and delightfully clear sulphurous springs of the Gost-
ciner Wildbad in Salzburg; the ferruginous waters of the
spring of the Roman camp in the mountains of Abanno, Batalgia, and other spots along the Leguanian
districts in the Venetian territory; and the acridulous waters,
which flow near Lenna in Illyria; these are but a small
number of the mineral sources which form so marked a
characteristic of the Austrian Empire, and among which,
there become articles of consumption in foreign climes, and
among other places Nellitz and Schwetsch export 500,000
stone bottles, Robuch 400,000, and Bulin 50,000, filled
from their several springs.

In the beginning of this article we spoke of the popula-
tion of the Austrian Empire as being estimated, in the year
1831, at 33,630,384 souls; and it cannot but prove interest-
king to look back and trace the constantly fluctuating amount
of the population at each successive ten years'
bureau. At the decree of the Emperor Charles VI., in 1740, the
total of the house of Austria had a population of 17,439,700
souls; at the close of what is called the 'seven years
war,' in 1763, the disasters of that war had reduced it to
16,000,000; and at the death of the Emperor Joseph II., in
1771, an interval of seventeen years only having elapsed,
it had increased to 17,436,000; during the following ten
years—which were rendered memorable by the attempts at
social reform made by Joseph II., a monarch who displayed
resolution much more than judgment, and even clemency
forswore—it rose to 24,427,000; those numbers were found to
have increased after the treaty of Campo Formio, in
1797, five years subsequent to the present emperor a seven-
years' war, and first census, on May 12, 1809, 24,609,497; in 1815, after the new settlement of the
German States, in which the Austrian States were
preparing for proceedings, the number of its inhabitants was
22,652,000; in 1895 it was reduced under the treaty of Pressburg to 22,067,892; and again, in 1807, under that of Vienna, to 20,693,583. Upon the downfall of Napoleon, the restorations and cessions of 1815 enlarged the dominions of Austria. It was thereby increased, and found inhabited by 28,413,489 individuals; in 1815 they had increased to 31,692,888; and six years afterwards, as we have already seen, to 33,630,381. From these last data it will be found that the average yearly increase of the population of Austria during the thirty years, between 1818 and 1843, was 941,289; now that as interval was marked by frightful losses occasioned by the cholera in Hungary and many of the adjacent provinces, we may safely conclude from the figures in the preceding population, and conclude that it does not fall short of 34,633,000 souls. We are not possessed of equally safe data, however, as to the proportions with reference to sex; but even here we shall not fear to be misled by presuming them not to have varied, in any essential degree, since the year 1818, when the ascertained numbers were 13,845,947 males and 14,587,533 females; showing an excess of 721,586 in favour of the latter. In the same proportion, the present classification of sexes would give a proportion of about 15,864,000 males to 17,750,000 females. These proportions are, however, by no means uniform throughout the several provinces; for the excess of females in Bohemia is 1:2:14 in every hundred souls, and in Moravia 1:2:9; but in the provinces between the Elbe and the Danube in general, in every thousand, the number of females exceeds that of males by less than 1 in every 1000; indeed, it ceases altogether in Transylvania, where the male inhabitants exceed the female by 1 in every 4500. About four millions and a half of the whole population are distributed among the two religious confessions, and the remaining thirty millions upon agricultural and rural occupations: one-fourth, too, are generally considered as inhabitants of towns.

The great mass of the Austrian population is composed of six distinct races—distinct, as much by descent, features, and bodily conformation, as in character, language, manners, and usages. Nearly one half, about 16,300,000, is of Slavonic extraction. Of this race are the Wends or Ventspils, in Livonia and the eastern parts of Russia; the Slavs and Hungarians, in the territory of the Hungarian despot, which border upon Hungary, and in certain circles in the latter kingdom; the Czechs, i.e. aboriginal Bohemians, of Bohemia and parts of Moravia; the Hanaks, Slavaks, and Podelanaks of Austrian Silesia and Moravia; the Poles of (two distinct classes, the Mazuraks and Gorals), and Russiaki, or Russians of Galicia and the mountain counties of Hungary and Transylvania; and the Morlaks and Montenegrines of Dalmatia, the military frontier districts, &c. Of the Tyrol and Tiroler, a part is Protestant and parts German descent: their numbers are estimated at 6,400,000; they form an integral part of the population in the Archduchy, Styria, Carinthia and Tyrol, Moravia, and Silesia; but are separate communities in Hungary, where their numbers are between 800,000 and 900,000; in Transylvania, where they are denominated Saxons, and have increased to about 500,000; in Galicia, where there are 145 colonies, consisting of about 75,000 individuals; in the Military-Frontier districts to the extent of about 10,000; on the Kulpa, in Carniola, where the Gotchewers amount to 47,000 or 49,000 heads; and in the Venetian territories around Asagio, where they have lived isolated for centuries under the name of the Serbs and Szekli Comunali, and are about 35,000 in number. The third race are the Magyars, who migrated from the Kuma and settled around the banks of the Danube and Thaya in the ninth century; they are esteemed to be of pure Asiatic extraction, akin to the Tartar and Turk, and are a fine and intelligent class of men; they are about 4,500,000 in number, form the majority of the population of Hungary and Transylvania, and are possessed of the finest lands in both countries; some part are settled in Transylvania, and scattered throughout Dalmatia and other parts of Austria. The fifth race are the Valaks, Daco-Valaks, or, as they term themselves, Romanoi, a medley of ancient Thracians, Romans, and Slavo-Romanians, in number about 1,350,000, whose language is evidently a corrupted dialect of the Latin and Greek; the Romans, indeed, have proved their Roman origin by the fact that they colonized Dacia at an early period, and forwards allowed to recross the Danube in the reign of the Romanian: this is therefore sufficiently confirmed for Transylvania, Hungary, and the Bukowina. The Jews, to the extent of about 220,000, form the fifth race; nearly, one-half of them are settled in Galicia, and about 160,000 in Hungary; the remainder are dispersed over Bohemia, Moravia, and other parts of the empire. The Jewish population, in number about 190,000, consists of Zigeuner, or gipsies, of whom upwards of 100,000 are conjectured to exist as wandering people in Hungary, Galicia, the Bukowina, and other provinces; Arnauts, Greeks, Armenians, French, &c.

The established religion of Austria being the Roman Catholic, it will be inferred that it is the religion of the majority of its inhabitants; and this inference will be corroborated by the following estimate:

Roman Catholics, and Greeks received into union with them, 27,800,000; Greeks not in union, 3,000,000; Protestants, of the Lutheran and other denominations, 3,000,000; Jews, 500,000; Gipsies, Mohammedans, &c., 110,000.

A reference to our former enumeration will show that, with a view to the civil administration, either the antient subdivisions of the soil have been retained, which has been the case in more conquered provinces, or their limits have been formed. We have, therefore, as the component members of this monarchy, seven kingdoms—Hungary, Bohemia, Slavonia and Croatia, Dalmatia, Galicia and Lodomeria, and Lombardy and Venice; one archduchy, that of Austria; one imperial principality, that of Moravia; and a gravitate, Moravia; five duchies, Styria, Salzburg (which now forms part of the Archduchy of Austria), Carinthia and Carniola, which are incorporated with Illyria, and Silesia, which, with Bohemia, forms part of the kingdom of Bohemia. Of these provinces, the archduchy and most of the principalities, are governed by the emperor himself, and are termed imperial dominions, while the rest are governed by a viceroy. The territories of Austria are divided into an imperial and a sovereign jurisdiction, the latter being the most numerous. The provinces are divided into districts, or kreis, as they are called, numbering between 100 and 200 each. The districts are divided into cantons or towns, and the cantons into parishes or villages. The capitals of the several provinces are: Vienna, the capital of Austria; Budapest, the capital of Hungary; Prague, the capital of Bohemia; and Salzburg, the capital of the Tyrol. The provinces of Austria are divided into three departments, each having a governor, or president, and a council of state, consisting of from 75 to 100 members. The departments are: the imperial department, consisting of the provinces of Austria, Styria, Carinthia, and Carniola; the sovereign department, consisting of the provinces of Bohemia, Moravia, and Silesia; and the military department, consisting of the provinces of Hungary, Transylvania, and the Tyrol. The provinces are divided into districts, or kreis, as they are called, numbering between 100 and 200 each. The districts are divided into cantons or towns, and the cantons into parishes or villages. The capitals of the several provinces are: Vienna, the capital of Austria; Budapest, the capital of Hungary; Prague, the capital of Bohemia; and Salzburg, the capital of the Tyrol. The provinces of Austria are divided into three departments, each having a governor, or president, and a council of state, consisting of from 75 to 100 members. The departments are: the imperial department, consisting of the provinces of Austria, Styria, Carinthia, and Carniola; the sovereign department, consisting of the provinces of Bohemia, Moravia, and Silesia; and the military department, consisting of the provinces of Hungary, Transylvania, and the Tyrol. The provinces of Austria are divided into three departments, each having a governor, or president, and a council of state, consisting of from 75 to 100 members. The departments are: the imperial department, consisting of the provinces of Austria, Styria, Carinthia, and Carniola; the sovereign department, consisting of the provinces of Bohemia, Moravia, and Silesia; and the military department, consisting of the provinces of Hungary, Transylvania, and the Tyrol.
archduchess, and the heir-apparent or presumptive Imperial Crown Prince. The great offices of the imperial household consist of a Grand Marshal, Lord Chamberlain, Master of the Horse, and Grand Master of the Court; but as great occasions the hereditary great officers of the several provinces number 124, are summoned to increase their splendour.

The administration of public affairs partakes of a twofold character: on the one hand, there are departments which superintend and conduct the foreign affairs of the state, and those for the interior affairs of the lands. In the hands of the Privy Chancellery, consist of a director and five secretaries, to whom those decisions are made known to the heads of offices. The great departments for general affairs, or, as we should term them, secretaries of state, are — . The Privy Chancellery of the Household, Court, and State, divided into two sections, the one for domestic and the other for foreign affairs, but under one general presidency — that of the prime minister, or chancellor of state. 2. The Council of War, which, under its president, takes charge of every matter connected with military or naval affairs, as well as of the political government of the Military-Frontier districts. There are thirteen military administrations, subordinate to this council, for the various provinces. 3. The Ministry of Foreign Affairs, containing the control of all foreign relations of the state, connected with the foreign department connected with finance, taxation, coinage, government printing, stamps, the post-office, the provincial authorities, the property of the state, mining, manufactures, and commerce, is attached to it in the person of the Ministry of Foreign Affairs (Commission), for systematizing the land-tax, and regulating the maintenance, &c., of the military. 4. The General Directory of Accounts. The specific departments, which are subordinate to the general department of the Privy Chancellery, consist of the United Chancellery, together with the Board of Education in connexion with it: its superior chancellor (for there are three others) is minister of the interior, and its province extends beyond a certain point of a civil nature of matters connected with the general welfare, but not to the affairs of Hungary or Transylvania. Those of the former kingdom are under the cognizance of the Hungarian Chancellery, to which a Board of Education is also attached; and there is another Chancellery for Transylvania, with a special Board for regulating all matters connected with education, religion, and endowments. The United Chancellery has twelve provincial governments under its control, the respective seats of which are Vienna, Prague, Munich, Lina, Gritza, Leubisch, Priest, Zara, Innsbruck, Milan, and Venice. One of these, or a representative of a president, in general a vice-president, and as many members as are requisite. They form a subordinate executive for the conduct of all public business which does not immediately concern the sovereign of the judicial, ecclesiastical, and military authorities.

The administration of justice is under the superintendence of the Superior Ministry of Justice (oberste Justiz stelle), at the head of which there are two presidents. It is divided into two sections: one at Vienna, for the provinces of Bohemia, Galicia, Germany, Illyria, and Dalmatia; and the other at Verona, for the kingdom of Lombardy and Venice. There are nine high courts of appeal and criminal jurisdictions in them: those in Vienna, Prague, Brussels, Innsbruck, Klagenfurt, Zara, Milan, and Venice. Next there are sixteen special courts, termed Landraths, in as many different towns, for adjudicating matters relating to the nobility, clergy, and corporate bodies; and local courts (Ortsgut) for such matters as concern the common lads. In some provinces, particularly the Italian, there are likewise civil and criminal tribunals of the first instance. There is a special court at Vienna called the Secret Chancellery for deciding all judicial matters in which members of the imperial family and foreign subjects are interested. Suits in commercial and exchange concerns are determined by the Mercantile and Exchange Courts, which exist in every principal town; and suits in admiralty are referred to the Maritime Courts, which have delegate reference (bürgerliche-substitutionen) under them. Criminal matters belong exclusively to the local courts and magistrates. The clergy are amenable, in all temporal matters, to the temporal judicatures; but the military to their own tribunals. The sovereign enjoys, excepting in very few cases, the prerogative of making laws. All provincial statutes have been abolished; nor are any complete codes extant but in Hungary and Transylvania, which have their own courts of justice. The maintenance of public order and prevention of public affairs are vested in the ministry of police, assisted by provincial and district boards. The censorship of the press is also wholly confined to its jurisdiction; but Hungary falls no way behind in publishing without regard or security of detail, for we are not disposed to follow others in attempting to unravel that over which the government has, at least by withholding information, thrown as almost impenetrable veil of mystery. We shall therefore confine ourselves, on the present occasion, to quoting what Malchus, himself once minister of finance under two German sovereigns, has stated as the general result of very diligent inquiries. 'A portion of the public income,' he observes, 'is derived from the immediate property of the king and the nobility; and a considerable portion from royalties and monopolies; but the greater part proceeds from taxes and rates, which are not, however, raised according to any uniform system for the whole state. The annual total of real and personal taxes (not including the absence of official data, can only be estimated with an approximative approach to the reality, can scarcely be less, after allowing for the expense of collection and management, than 15,000,000 golden (about 14,859,000l.); and on this might perhaps be set down 15,000,000 (or 14,860,000l.). This is also the estimate of Blumenczsch.) Towards the amount the immediate property of the state contributes about 15,000,000 (or 14,250,000l.); a sum of 61,000,000 (or 58,075,000l.); the provision for the revenue of the Upper Ems, with Salzburg, 4,000,000, or 3,940,000l.; Bruns, the same, 570,000l.; the Tyrol, 4,500,000, or 4,427,000l.; Illyria and the Maritime Territory, 4,700,000, or 4,627,000l.; Bohemia, 15,500,000, or 1,583,000l.; Moravia and Alsace, 15,000,000, or 1,490,000l.; of the kingdom of Hungary, 33,217,000, or 3,155,700l.; Transylvania, 6,500,000, or 617,500l.; Dalmatia, 500,000, or 47,500l.; and the kingdom of Lombardy and Venice, 18,000,000, or 17,090,000l. The sum of these several amounts, however, is 15,100,000, which is a little above Malchus's estimate, but not by a sum so understating less than Malchus's estimate. With respect to the expenditure, be added, we labour under a paucity of these, and these refer to earlier times: they are indeed so imperfect and equivocal a description, that they cannot possibly serve as the groundwork of any estimate of the present amount of the public expenditure. And has amount is borne out by that of the writer who has supplied us with the preceding amounts: 'A much greater degree of stability and security,' says Halle, 'is necessary in the public expenditure than the income. This only is not to be questioned, that the army alone absorbs one-third of the whole revenue, though not so much as Liechtenstein asserts, nearly 14,000,000 golden (13,500,000l.); whilst he states the expense of the crown and public duties at 54,000,000 (5,138,000l.). All personal and many other charges are defrayed by the sovereign out of his private property, which is not in any way connected with the public revenue, and not unusually large amount. Moreover important the subject may be, we must not enter therefore, with our present ignorance; and we close it with the remark, that the amount of the public debt, according to Malchus's calculation, may be estimated at between 160,000,000 l., and the annual payments of 80,000,000, or 76,000,000l.; and that the amount of paper money has been reduced to 53,411,510 golden, or 8,564,400l.

The management of the military resources of Austria, as
we have before remarked, is committed to the council of war; these resources are of two classes, the one the peace, and the other the war establishment, as shown in the following statement:

The Infantry, in time of peace, consists of 58 regiments of the following strength:

15 Hungarian and Transylvanian, 8016 rank and file, 593 in the remaining provinces, 1921, 81,851
7 regiments of Grenadiers, 50 battalions of 600 each, 30,050
7 regiments of Sharpshooters, viz. 238 of 2500, and 12 of 5000 each, 62,735
2 regiments of Voltigeurs, 649 in Lithuania, and 12,340 in 16 districts, 9,390
11 Frontier Regiments, viz. 272,445 and 9,482 in each, 42,915
6 regiments of Musketeers, 10,000 in 16 districts, 9,100
4 regiments of Musketeers, 13,815
20 regiments of Pioneers, 10,000 in 16 districts, 2,430
2 regiments of Artillery, 1,075
3 regiments of Artillery in 12 districts, 2,490
2 regiments of Artillery in 12 districts, 2,490
The Corps of Engineers, 500
Demi-Engineers, viz. 7 companies of Sappers, 797, 2,007
Artillery, 8,009
Infantry and Artillery Drills, 271
2 regiments of Infantry, 10,000
2 regiments of Artillery, 1,075
The Corps of Engineers, 500
Demi-Engineers, viz. 7 companies of Sappers, 797, 2,007
Artillery, 8,009
Infantry and Artillery Drills, 271
2 regiments of Infantry, 10,000
2 regiments of Artillery, 1,075
The Corps of Engineers, 500
Demi-Engineers, viz. 7 companies of Sappers, 797, 2,007
Artillery, 8,009
Infantry and Artillery Drills, 271
2 regiments of Infantry, 10,000
2 regiments of Artillery, 1,075
The Corps of Engineers, 500
Demi-Engineers, viz. 7 companies of Sappers, 797, 2,007
Artillery, 8,009
Infantry and Artillery Drills, 271
2 regiments of Infantry, 10,000
2 regiments of Artillery, 1,075

Total military force on the peace establishment 286,902

Whom, however, the enemy is to be placed on the war footing, the subsequent augmentations take place:

In the Infantry, an increase of 660 to 700 rank and file to the 43 regiments not Hungarian, 29,240
Legion of the first battalion of the Landwehr (Militia), being 2 added to each regiment, 11,416
Legion of the third battalion of the 35 Hungarian and Transylvanian regiments, 17,620
Legion of the second battalion of the 35 Hungarian and Transylvanian regiments, 11,416
Legion of the fifth battalion of the Landwehr, for reserve, 1,000, added to the 43 regiments 69 companies, 14,198

And afterwards:

Legion of the Reserve of the Frontier Troops, 30,000 224,276
The two remaining companies of the 35 battalions of Land wehr, 18,480

Add the peace establishment, 344,598

The infantry on the full war establishment, 490,092

In the Cavalry, the Hungarian inscription, about 16,744

Supposing, therefore, that no augmentations be made to the other corps in the service, the disposable force of the empire, when carried to its full war complement, amounts to 449,633 infantry, 53,714 cavalry, and 30,657 artillery, engineers, &c., which give a total of 537,224 men, or at the rate of about 13 in the rank and file, every male peasant and citizen being liable to serve in the line from the age of 19 to that of 27, and from the latter age until he attains of 50, in the Landwehr; the only exemptions are in favour of the nobility and clergy, and in a few other instances. The Hungarian and Transylvanian troops are recruited by bounty, or filled up by the contingents to which the nobility and free towns are subject. The number of field-officers, attached and unattached, is 416; viz., 8 field-marshals, 34 field-masters-general and generals, 12 field-marshal-lieutenant, 199 major-generals, and 309 colonels.

The military seminars comprise the Academy of Engineers in Vienna, in which 79 cadets are gratuitously educated; the Military Academy at Wiener-Neustadt for 447 cadets intended to serve on the quarter-master-general's staff; the Military Academy at Waizen in the circle of Pest in Hungary; the Cadet Companies at Olmitz and Grätz, each for 124 to 180 pupils; the Schools of Artillery; and the Military Cadet Institution at Milan; there besides 48 schools for the military education of boys; 54 regimental schools; a Military Geographical Institution at Milan; a Medico-Chirurgical Academy in Vienna for pupils intended for the army service; veterinary schools in the same metropolis, and at Pesth and Milan an establishment for forming gunmakers at Steyer in the Upper Enns. There are invalid hospitals in Vienna, Prague (with which three branch establishments are connected), Pesth in Hungary placed Pesth, and Vienna in France and Tyrmann. Soldiers not wholly disabled are drafted into the invalid battalion at Ceneda in the delegation of Venice, or enjoy pensions which vary according to their length of service.

The number of actual fortresses amounts to 26, of which the most important are Eisenstadt in Carinthia, Gradisca, Josephstadt, Carlsburg, Kingingrätz, Komorn, Legnano, Mantua, Olmitz, Palma-Nuova, Pesciher, Prague, Pfarverdein, Ragusa, Salzburg, Temesvar, Theresienstadt, Venice, and Zara.

The Austrian government have also the right of garrisoning the papal fortresses of Commachio and Ferrara, as well as Placentia in the principality of Parma, and Mayence in conjunction with Prussia. Besides these there are 60 fortified places of inferior strength, which are not under the government of the Archdukes, but the territory is divided into 13 military districts, each under the control of a general of superior rank, assisted by a regular establishment with five subordinate departments, viz., a military, political, economical, victualling and clothing, and judicial department. The council at war in Vienna consists of 15 different departments for conducting the various branches which come within its cognizance.

The Austrian navy is under the management of a naval commandant at Venice, who is accountable to the council of war. It consists of between thirty and thirty-four vessels of war; among which are three ships of the line in ordinary, five frigates, five sloops, eight brigs, and six schooners. The establishment is attached to it 550 marines, and engineers, a cadet academy, and a corps of marines. The flag, which is borne also by the merchant vessels, is of a red ground, with a broad white stripe in the centre.

In a preceding page we have spoken of the Roman Catholic as the established religion, and given an enumeration of the numbers who adhere to that faith and the other leading creeds professed by the people of Austria. With the exception of Hungary, Transylvania, and the kingdom of Lombardy and Venice, there is no part of the empire in which at least the letter of the law places the non-conformist upon anything like an equality of rights with the Catholic; in the other provinces, whether he be Protestant, Greek, or Jew, he is interdicted from any profession of the Gospel. The Roman Catholic Church of Austria acknowledges the Bishop of Rome as its visible head, but is otherwise sufficiently independent of it, as all appeals to the Rota Romana are prohibited, and no papal bull or decretal can be promulgated in any form. The pope's nuncio is recognized in no other character but as an ordinary envoy from his court; nor have the horrors of the Inquisition at any time been allowed to disgrace the Austrian soil. Persecution, it is true, has at times despoiled the land with blood, but never otherwise than as the effect of over-excited religious antipathy and a spirit of retaliation. At the head of the hierarchy are the thirteen archbishops of Vienna, Prague (primate of Bohemia), Lombar, Milan, Legnitz, Prague, Olmitz, Graz, and the same time primate of Dalmatia, Gran (primate of Hungary and hereditary legate from the Roman see), Eralu and Kolocza (for the states of Hungary), Lemberg, Smaltalo, Ragusa, Salzburg, and Udina (for the kingdom of Lobardy and Venice). The archbishops of the national church have also an archbishop at Lemberg. Next to these its heads follow the sixty bishops, most of whom are suffragans of the archbishops, to whose sees their dioceses are generally subordinate. In the second clergy consist of two tituclar bishops, the members of the diocesan chapters, six heads of collegiate endowments, archpriests, deans, rural deans, parish priests, local chaplains, co-operators and vicars, and beneficed ministers. The higher clergy, consisting for 447 cadets intended to serve on the quarter-master-general's staff; the Military Academy at Waizen in the circle of Pest in Hungary; the Cadet Companies at Olmitz and
and Venice (where every available acre is judiciously cultivated); but there are parts, such as the north of Hungary, Upper Styria, Carnishta, the Maritime Frontier, Dalmatia, the Tyrol, and some of the islands, where there is a few or more or less of every kind of produce from 131,000 to 142,000 quarters of rice, independently of 4,400 to 5,600 more grown in the marsh-lands of Temeswar, Slavonia, the Military Frontier districts, Dalmatia, and other provinces in the south. It has been estimated, indeed, that the growth of these several substitutes for wheat and rice increases the annual produce of grain adapted for human subsistence to 41,400,000 quarters. Buckwheat, millet, podded grains (the Bohemian pea particularly), and lentils, rapessed (turnips), sparrow-grass, and ordinary vegetables, are or more less cultivated in almost every part of Austria: nor is there any want of an adequate supply of fodder for horses and cattle, in the growth of which, especially of clover and lucern, Lombardy, Styria, the Tyrol, Dalmatia, and the Upper Ena, are invigorated like the countries of France. Though we have no complete accounts of the produce of the meadow lands in Austria, an approximate estimate may be arrived at by assuming the crop of hay and aftermeal to be the same as that of the Tyrol, Lombardy, and the Upper Ena. The average annual price of hay for the whole yearly supply will give about 12,250,000 tons for the yearly supply. Much pepper (called popria, or Turkish pepper) is derived in Hungary from the cappucum annuum; mustard is raised everywhere, the finest in Moravia and Lombardy; and horseradish, of which Lombardy and the provinces of Znyam in Moravia; ginger is cultivated in the Lower Ena and Slavonia, and trifles chiefly in Lombardy. Among commercial products the tobacco, raised to the extent of 200,000 cwt. in the south of Hungary, is accounted by some the best which is grown in Europe; an excellent kind is also produced in Slavonia, Transylvania, and Galicia; and no small quantities in Styria, the Tyrol, Lombardy, and other districts. The quality of the latter is generally inferior; but the whole produce is 75,000 cwt., and the excess for exportation beyond the domestic consumption. Of those 75,000 cwt., about 300,000 are raised in Hungary alone, 80,000 in Transylvania and the Military Frontier, 120,000 in Galicia, and 50,000 in Moravia. Of hops, Bohemia not only yields the finest sort in Germany, but has been known in some years to export as many as 12,000 or 15,000 cwt.; Galicia, Moravia, and Transylvania raise sufficient for their own consumption. Flax, of uncommonly fine quality and great length of fibre, is cultivated about Crema in Lombardy, and other parts of the delegation of Loddi and Brescia; the Silesian is scarcely inferior to it; and, next to the latter, stand Moravia, Bohemia, Styria, the Lower Ena, Hungary, and Carnishta. The whole quantity raised in the last and other northern provinces, however, inadequate to supply the demand, although Transylvania makes it an article of export to Wallachia. Hemp of peculiar goodness is grown in the district of Hanna in Moravia, and inferior qualities in Silesia, Transylvania (which exports large quantities), Styria, Bohemia, Carnishta, and the Tyrol, but what is raised in Hungary is of worse colour and shorter fibre. Though hemp is not so universally cultivated in Austria as flax, it ranks second in the order of the staple productions. A substitute for this article, called Gunster, grows in the wild state in Dalmatia and Croatia. The indigo of North Carolina has been transplanted to the Milanese, and is said to grow in the original state in the same and general excellence; and the profit of the Lombardy provinces is not superior, to any grown in Europe: it is one of the products too of Hungary and some of the islands on the coast of Dalmatia. The cultivation of manure, which was introduced into the Lower Ena at the close of the last century, has been checked by the return of peace; it is now principally confined to some few districts in the south of Hungary, where it appears to have been raised and locally much, as a matter of earlier days; though the subject is not generally known. Besides indigo, a species of indigo, which is a product of Slavonia and Carnishta, wood is reared as a substitute for indigo in Hungary, Bohemia, and in the eastern parts of the Lower Ena; safflower is no longer a product of Bohemia, where, we are told, the improper use made of it as a article of food by the peasantry has occasioned its cultivation to be prohibited, but it continues to be grown in large quantities in Hungary and the Tyrol. The principal horses are produced in the eastern parts of the empire and foreign countries, is carried on in Hungary in what is called yellow wood (rhista cotinum), the stem of a shrub which grows spontaneously in the southwestern districts and Slavonia, under the name of the woods, and is largely employed in some of the processes of dyeing.

The principal medicinal plants cultivated in Austria are—rubia, which is raised in Styria, the Lower Ena, Bohemia, and Galicia; liquorice, a favourite article of growth in Moravia, whence 400 tons annually are annually exported, and which is also gathered in the wild state in Hungary and Slavonia; manna, derived from the Prunus aurum, which abounds in the forests of Hungary and Slavonia; and blue poppy, which is extensively used in the hospitals and apothecaries in the mountains of Carnishta, Styria, the Tyrol, and the Upper Ena. The white species of this plant is mostly exported to the Levant, where the Turks and Greeks make use of it in their baths on account of what they conceive to be its invigorating properties. A market for safflower is found in Carnishta and Styria from gentian, which is found in most of the elevated regions; and Iceland-moss is collected in considerable quantities on the Carpathian mountains, where its growth is extensive.

The cultivation of fruits is carried to a great extent in every part of Austria, with the exception of Galicia; the best descriptions are raised in the Archduchy, Styria, the Tyrol, Moravia, and Bohemia, Illyria, Lombardy, Croatia, Slavonia, and Dalmatia. The larger number of the fruit gardens and small gardens are scattered throughout the western part of the empire, and the adjacent islands; while the smaller gardens are in the north and south-eastern provinces. In these latter the grape is cultivated largely; the best grow near Carne, and the district of Traun in Dalmatia, in which valency the principal oil produced is 50,000 or 60,000 barrels per annum; Istria also manufactures about 30,000 barrels a year; but the production of this article is not at all adequate to the consumption of the empire at large. Melons are cultivated in Lombardy, Venise, and Hungary; but as garden-fruits only in other parts of Austria. Hungary indeed has been the best time to be cultivated for melons. In that country, the fruit is raised both on the open field and garden, and eaten by all classes, of whom the lower use the water-melon, which succeeds best in cold climates.

We have seen that more than one-third of what is deemed the available soil of the Austrian dominions, is occupied by woods and forests; it is equal, indeed, to a fourth part and upwards of the whole area; and it will therefore naturally follow that the same occupations are more extensively pursued than in almost any other country in Europe. The more level districts grow the oak, beech, ash, alder, elm, poplar, lime or linden, birch, willow, and plantain; whilst the fir, pine, larch, cedar, and yew, and, where these will not thrive, the dwarf pine and larch, prevail, save in the mountains and higher forest in Hungary, which is above fifty miles long, and from ten to five and twenty broad, and the Draganisch in Illyria, as well as the forests of the Buckowma, Slavonia, and Dalmatia, abound in oaks of extraordinary dimensions.
and would afford inexhaustible resources to a state like England. The following details from Lichtenstein will however convey a more exact idea of the extent of these forests. The woods and forests of Hungary to occupy a surface of 8,948,740 yochas; of Transylvania, 4,492,900; of Galicia, 2,645,373; of Bohemia, 3,139,811; of the Military Frontier districts, 2,172,793; of the Archduchy of Austria, 1,585,650; of Lichtenstein, 1,530,600; of Lombardy and Venetia, 1,465,400; of Illyria, 1,359,461; of Moravia and Silesia, 1,120,285; and of Dalmatia, 633,100, making altogether a total of 31,166,748 yochas, or about 44,000,000 acres. With proper fuel, we have no means at band of ascertaining the quantity of wood felled for its supply. The neglect of the forests, particularly in the neighborhood of large towns, has become so crying an evil among the Austrines of late years, that general attention has been directed to the subject, and much praise is taking to prevent the recurrence of a deficiency of fuel, by fresh plantations, in which Prince Lichtenstein has set a most useful example, above two millions of American trees and shrubs having been added to the woods on some of his estates in the Archduchy and Moravia. Among the products of the Austrian forests we may name potatoes, which are chiefly made in Hungary, Gailicia, and the Buckowine, Moravia, the Archduchy, and Bohemia; and in regard to the number of tons produced, stands in highest estimation; the supply from Galicia, and from the Buckowine, where fourteen works yield above 300 tons annually, is also considerable; and there are upwards of 600 manufacturers of the article in Bohemia, where 5000 tons are produced for exportation, besides supplying its domestic consumption, for which nearly 5000 tons are required. Moravia is also a considerable exporter of potatoes; and there is a sort made at Deutsch-Brodersdorf, in the Archduchy of Austria, which is said to be superior to any that is produced elsewhere. In no other province is this branch of manufacture carried to any extent. Tartar, charcoal, gall-apples, and turpentine should be added to this enumeration of the products of the Austrian provinces, though they are not of consideration; that of tar, for instance, not exceeding 300 tons; that of gall-apples being not more than 8000 l. in yearly value; and that of turpentine not exceeding 1000 l.

The quantity of wine annually made in the Austrian territory averages between 570,000,000 and 600,000,000 gallons. Of this produce, Hungary contributes 370,000; Lombardy and Venetia, 83,670,000; the Archduchy, 36,000,000; Transylvania, 15,000,000; Styria and the Tyrol, about 9,500,000; Carinthia, 8,500,000; Galicia, 6,800,000; and Bohemia, 605,000. The quantity consumed by the inhabitants themselves is estimated at 523,000,000 or 540,000,000 gallons. No wine is made in Galicia, so the climate, as we have before remarked, being unsuitable to the growth of the vine: nor has it been made in the adjoining province of the Buckowine until within the last few years. The 'King of Wines' is a native of the Austrian soil: it is the produce of a district not much more than one hundred square miles in extent, situated on the high grounds of Tokai and Tarczal, which form part of the Hegyalja range of the Carpathians, in the circle of Zemplin, in north-eastern Hungary; and it is somewhat remarkable that the generous grape, from which the several species of mode, sauté, and suave sweet-wines, as well as the sweet andromatic liquor, is derived, has the same short and intense clime of origin, that is peculiar to the best Hungarian or Rhinisch. We know of no sparkling wine in Austria except that which is imported from the valley of Vinidol, in Croatia. Some strong wines, particularly Muscatel and Portusces, as well as the delicious Mihai del Tez are produced in Dalmatia; but there are none of marked excellence made in the Italian provinces. The whole exports of this article from the 4 Austrian dominions are estimated at about 75,000,000 gallons.

The forests of Austria produce principally the leading productions which characterize the vegetable kingdom in the Austrian Empire, we will now direct our attention to the resources with which the animal kingdom has supplied it. And here we shall again have recourse to the general estimates made by Gmelin, which are at present confirmed upon by other writers on the subject, are said to have had access. He tells us, that the domestic and more useful classes of animals, of which the whole Austrian stock is composed, returns for the year 1822:

Horses (including one to three year old foals) 1,600,000 to 1,500,000; mules and asses, from 60,000 to 70,000; horned cattle (including one-fifth for the young), 9,000,000 to 10,000,000; sheep (of which about one-eight are of improved breeds), 16,000,000 to 17,000,000; swine, 6,500,000 to 6,000,000; goats, 800,000 to 900,000. Blumenbach estimates the number of horses as high as 2,300,000; and of the sheep, at 19,000,000 or 20,000,000, among which are some few of the Dusheley and New Leicester breeds, introduced in 1823.

Malchus, a subsequent and very recent writer, has likewise investigated this subject with much care, and we give the following statement upon his authority, to which we have added some such principal provinces, in order to facilitate the comparison between them:

To this statement it may be added that the proportion of oxen to cows is estimated as being that of 7 to 12, and the whole number of mules and asses at between 55,000 and 59,000. With respect to the horse, the finest breeds are reared in Transylvania and the Buckowine; they are well formed, and of Turkish descent: the Hungarian, on the other hand, are of slender make, and commonly much below fifteen hands, their greatest height being usually about 14 hands. The Galician breed, with the exception of the few of Polish blood which are bred in the circles of Zloczof and Bresary, are of still more diminutive size, and in general trained from a wild state, but they are remarkably gay, as well as swift-footed. The Bohemian and Moravian horse is principally adapted for agricultural purposes, whilst the breed reared in the Archduchy, Styria, and Carinthia, are of strong and powerful make, fitted for private use and military service; but the stock of the latter is by no means abundant. In fact, the supply of horses in the Austrian dominions is so inadequate to the demand, that they are compelled to resort to Naples, Mecklenburg, and even our own country for carriage-horses, as well as to various parts of Germany for remounts for the cavalry. The immense stud, which the government maintains in Hungary, Galicia, the Buckowine, and other quarters, where thousands of this useful animal are reared and trained, have, however, not contributed to replace the deficiency occasioned by the destructive succession of wars out of which Austria is emerging. Lombardy takes the lead in supplying mules and asses, and conjointly with Venetia possesses a stock of 48,000 and 49,000, of which 10,000 are above fifteen years of age, and 48,000 of the whole Austrian stock. The males of Illyria and the Tyrol are larger, stronger, and handsomer than the ordinary race, and as swift as the fleetest horse.

Of horned cattle the choicest breeds are reared in Hungary, Transylvania, Lombardy, and Styria; those of the first two countries are remarkable for their size and handsome horns, as well as the quantity and quality of their flesh; the Lombard, the Styrian and Hungarian breeds, and are of handsome size and strong make; the Styrian breeds are the same large, long bodied, crumpled-horned, short-legged race as the Carin
thens and Croats. Although Hungary, Galicia, and their

southern neighbours export between 150,000 and 150,000

head of cattle annually, their graziers have not been fortunate

enough to have been constantly on the decline during

the last forty years; the Austrian farmer and grazier

having found it to their interest to attend rather to their

flocks than their herds. The produce of Austria in tallow,

cheese, cheese, and other kinds of manufactu-

res. Buffaloes are bred in parts of the south of

Hungary, as well as in Transylvania and Slavonia, where

they are used for the purposes of draught, it being found

that, in those countries at least, a buffalo can draw a heavier

load than three native horses, and is indicative to the

quality of his food: their milk is also extremely rich.

The breeding of sheep has in most parts been followed

up to the injury of the stock of cattle. In Bohemia,

Moravia, the Low-silesian and the Lower Galician parts

are not so rich in quality, arising from the cross of the native

breed with the Spanish Merino, has more than counter-

balanced a trifling decrease in quantity. But there is

no part of the Austrian dominions equal to the east

of Hungary and to Transylvania for the extent of their flocks

and pastures. Hungary, indeed, possesses so much larger a

supply than is necessary for its own use, that there have

been years when it has exported above half a million of

sheep, and is now exporting from 170,000

lambs and 1,400,000 lbs. of wools. The latter

is chiefly obtained from the common Hungarian race

(ovis strepenceros), a breed with long twisted horns, and

long, clothy, hairy wool, not found elsewhere excepting on

Muravievo, in the east of the Carpathians, and

coarse texture. In the western and southern parts of

Hungary the breed has been improved by crossing it with

Merinos, and now yields very fine wool. Galicia has

much increased its flocks during the last thirty years, and

greatly improved them by mixing them with Merinos; its stock,

which amounted to 375,000 only in 1807, has now risen to

nearly 550,000. In the east of Lombardy, the Venetian
territory, Dalmatia, and the Quarnaro Islands, where the

Parish of the cattle is an excellent quality of wool

obtained. On the whole, Austria does not, however, pro-

duce as much wool as the consumption of her manufactu-

res requires, and therefore makes up the deficiency by

importation from Turkey and other countries. Her natural

supply has been estimated at 474,000 cwt. per annum;

namely, about 10,000 of superfine, 270,000 of fine and

mudding, and 170,000 of coarse qualities. We should add,

that there are five distinct races of sheep bred in Austria;

the largest is the Zechelbian breed in the Carpathian

mountains, just described, the common curly-coated sheep, the improved

breed, the Padman, and the pure Spanish or Merino species.

The rearing of goats is carried to so great an extent in

some districts that animal food is eaten at certain periods

of the year. We have been assured that in some

instances the number may be estimated at 500,000 or 600,000. They are

primarily bred in the mountainous districts of Austria and

Lombardy, and good choice is made from their milk in the

Tyrol and Bohemia; but the domestic fowls of the Transyl-

vanian, the west of Lombardy, where there is

an abundance of other poultry, is simply counterbalanced

in Bohemia, Galicia, and Hungary, in which quarters the

turkeys have been introduced, and are used partly in

down and quills. The pleasant of the finest Austrian

breed is a native of the first-mentioned of these three king-

doms, though this bird abounds equally in all of them.

The Tyrol is celebrated for rearing canary birds, of which be-

comes in 3000, 4000, and 5000 cwt. per annum;

i.e. a peculiar breed. It is said indeed that ' an Hungarian

would die without coffee.' In the north-

western parts of Hungary, too, prosperity is bred in such large

quantities that one can scarcely pass from village to village

without encountering flocks upon flocks of low

ducks, geese, and turkeys. The same may be said of the districts

around the Austrian metropolis, and indeed more or less,

of every province within convenient reach of large towns.

Cattle and sheep are carried away by thousands from Styria

the latter are the ordinary domestic animals of the Transyl-

vanian. The west of gomardy, where there is

the streets of Austrian empire abound in Austria. The

is found in the Lower Austrians, and the Tyrol, where the Turks

are sometimes caught that weigh fifteen

hundred pounds. Next to the sturgeon is the pike,

the largest of which is at times forty pounds in weight; it

is found with the carp and trout in the Theiss and other

rivers in Austria; but it is not to be confused with the

lamprey of the Milanesi to the salmon of the Vistula,

for each interwending stream or sheet of water, we should

omit scarcely one species out of the numerous fresh water

fishes which abound in the countries of Europe. We must

not, however, forget the pearl-bearing mussel which was

raised in the rivers of Hungary, the Archduchy, and Bohemia

of which the finest are taken in the Vata, where a

regular pearl fishery is carried on, and in the Moldau, Ilz,

White, and Kaseebach. The oil of Dalmatia, in particular in Lake Sebenecko; and the tunny

mackerel, anchovy, and other sea-fish are caught in the

Adriatic. The fisheries on the Dalmatian coast employ

fifty individuals, and yield a yearly return not far short of

500,000 fls.

The rearing of the silkworm, though not wholly neglected

in other parts of the south of Austria, is no where carried on
to such an extent as in the territory of Lombardy and

Venes, where it was introduced from the two Bessars by the emperor

Charles V. The western districts of this kingdom, and

those on the right bank of the Mincio, are said to produce nearly

3,500,000 pounds of silk per annum, and there on its

left bank, which comprehend the Venetian provinces, about

500,000 pounds; both together not exceeding seven-eighths of all the silk raised in the

Austrian dominions, and give employment to upwards of 100,000 hands.

This branch of industry is actively prosecuted also in the

eastern districts of the Tyrol and Illyria, as well as in Dal-

matia, which produces considerable quantities of raw silk.

An inconsiderable quantity is likewise raised in the

south of Hungary, Slavonia, and Croatia. On the whole

it has been computed that the annual production of silk

in Austria amounts to 3,700,000 pounds weight, of which from

1,300,000 to 1,700,000 are used for domestic manufacture, and

that its value is between 1,500,000 fls. and 1,700,000 fls. sterling.

Nemrich states that the Milanese alone yields 23,000 pounds weight more than all Pedmont; but that the quan-

tity, though better than the French, is inferior to that of

the Piedmontese, next in goodness to which stands the Bres-

arian. A very considerable proportion of this article in

the wroght state, chiefly of the sort termed 'organs,' is

exported from the Italian provinces to the English market.

Bees are a peculiar object of much labour and

attention in Austria, and numbers of them who

receive an income from their productions, possess aparatus

of 150 or 500 hives. In many parts, however, those industrious

people are almost entirely to their interest, or at least

no other care is bestowed upon them than the hole in the tree in which they establish their communal

wealth, and providing them with a shelf. In Dalmatia,

where the small districts of Cattaro annually exports about

1,500,000 pounds weight of wax and honey, the hives are con-

structed of rough marble with a marble lid, and the

Austrian honey is the white kind made in Hungary and

Galicia: the whole quantity produced is estimated at

330,000 cwt., to which 20,000 cwt. of wax may be added.

Besides the bee, cantharides, or Spanish flies, are a con-

Digitized by Google
considerable article of export from Hungary and Slavonia; the
earthly insect draws many purchasers into the sandy tracts of
Galicia from Turks and Armenians; and the lease of late
years has become an article of considerable trade between
Austria and Portugal.

In Mineral Productions Austria surpasses every other
country in Europe. With the exception of platinum, it
would be difficult to name any metal which it does not
possess. The richest of its gold-mines are in Transy-
vania, which produced one third of the national output
and in which no less than forty are worked, the most
productive being at Voráschatz, Szalatafa, Fashebay,
and Nagy-Ag; the annual quantity of pure metal which
there is produced is about 20,000 ounces. The gold
obtained in Hungary is partly found in a pure state,
but most commonly extracted from silver, and even at times
from copper ore: the mines of Lower Hungary produce about
20,000 ounces yearly, and those in the north-western dis-
tricts about 5,000. There is a mining academy at Schem-
nitz (or Selmecei-Banya), in the heart of the latter, which
has greatly advanced the science throughout Austria, and
become the resort of many foreigners who are desirous of study-
ing it. The remaining produce of this metal, in the circle of
Salzburg, the Tyrol, and other provinces, including the dust
collected in the Danube, Murh, Drave, Marosch, &c., is, as
is not estimated at more than 2,400 ounces; so that the total
quantity of gold annually accruing to the crown is about 60,000
ounces, of which the mine of Béuna, about 26,000. And here it
should be observed, that all ores found in the Austrian dominions are
the property of the sovereign. Hungary possesses the richest of the
eutreizes, in which the mountains about Schemnitz and Nagy Ag contain
the ore; and the annual produce, riveted from that kingdom is about 1,100,000 ounces, of which
nearly three-fourths are from the Schemnitz district. The
other parts of Austria which produce this metal are Transy-
vania, about 45,000 ounces; Bohemia, particularly the mines at
Hradiska, in the circle of Béuna, 103,000; and the
lace, from the lead-mines near Kirhaha, 9600; Styria,
19,000; Galicia, 4600; and Salzburg and the Tyrol,
about 4000. The decline in the richness of the veins which
was noticed already in the 17th century, the inroads of the
Vendues, and at Anasberg, in the province of the Lower Lus, has
occasioned them to be almost abandoned of late years.
It would appear, therefore, that the annual production of
the silver mines is between 1,390,000 and 1,300,000 ounces, and
that value is estimated at rather less than 220,000l. No
part of the empire is so rich in copper ore, or yields so
large a supply of the metal, as Hungary: its most produc-
tive works are in the mining district of Schmilinitz, or
Szomolkosz, where they employ between seven and eight
thousand men; and the mines are about 300 feet below the surface
of that kingdom, which amounts to 140,000 cwt. at least.
The "cement water," which the Zips brings down to Schmilinitz,
and of which instances again occur near Neuosol in northern
Austria, is a mass of very hard, and is so formidable
as to be passed over without notice. The rivers in
these parts are saturated with sulphate of copper, which is
precipitated on all iron thrown into them; in this way from 1500
to 1700 cwt. of copper are extracted from them every year.
The copper works at Davos and Szenndomokos in Transy-
vania produce about 2500 cwt. per annum; the Styrian,
1000; the Ilyrian, 1000; those of Galicia and the Buck-
swick, 2000; the Tyrolese, 1200 to 1500; and the Dalmatian
and Istrian, 1000. On the whole, the annual supply of copper
from Austria is estimated at 12,500 to 15,000 cwt., and is not
likely to appear to amount to about 2500 or 3000 cwt. More than
doubly this quantity of lead is produced; and above one
fourth of it, namely, between 1750 and 3000 tons, proceed
from the Bleyberg (salt mountain), Hinterberg, and other
mines in Carinthia. The Hungarian are next in value, their
produce averaging about 1200 tons a-year; and to these
may be added 1100 from Bohemia, 350 from Transylvania,
about 32 each from Salzburg and the Buckswick, and 50
from the circle of Béuna, making the whole quantity of the
whole yearly produce of lead is estimated, however, at 9000
tons. Iron is a metal of which almost inexhaustible
reserves exist, though, on account of the dearness of fuel,
they have not yet been turned to any very extensive
use. The iron mines in the empire are at present
about 80,000 per annum, in value about 600,000l.
and of this quantity nearly more than one-half is derived from Styria, Carinthia, and Carniola alone, the former pro-
vice producing about 33,500 and the latter two about
23,000. The most productive of the Styrian mines are those
which lie between Eisenerz and Vorderberg, and yield
upwards of 14,000 tons, and those at Neuburg and Gobrach,
which have been known to yield above 5000; the remainder
is supplied from fourteen other works, worked in the
iron, as well as that of Carinthia, which was known among
the Romans by the name of 'Noric Iron,' is in general
placed for its excellence on a par with the Swedish,
and Dutch, and sometimes takes the name of "English iron.
In the Hüttenberg, Carinthia possesses one of the oldest
and at the same time one of the richest, iron mines in Europe,
its produce being from 8000 to 9000 tons a-year. The circles
of Béuna, Rakonitz, and Pristen, in Bohemia, are also rich
in this metal, and produce about 5000 tons a-year. The
whole of the iron smelted in Austria is about
10,000 tons. The other parts of Austria from which it is
obtained are Moravia and Silesia, in all about 9000 tons;
the Archduchy, between 1200 and 2000; Galicia, 2000;
the fourteen works in the Buckswine, 450; Transylvania, 850
or 900; and Hungary, particularly in the circles of Gomar,
Liptau, and Sohl, where the best of its iron is produced,
and the first of which supplies 5000 out of the 7000 tons raised
in that kingdom. The mountains of Lombardy lying within
the territory of Brescia, Bergamo, Como, and the Valteine,
where there are 50 shafts open, which supply iron for thirty-
sevens high-blast furnaces, are also estimated to produce
from 5000 to 10,000 tons a-year, a considerable proportion
of which is made into tin. Tin is raised in no part of Austria but Bohemia, and the whole of the 2700 tons produced
2000 cwt., which is far short of the consumption. The quality,
however, is good; and indeed that which is obtained from the
Schlackenwalde mine, in the circle of Eilenbogen, is said to
equal that of the French. There is no mine of quicksilver in Europe so rich as the mine at Idria in Car-
niola, the produce of which has, however, generally declined
from 12,000 cwt. a-year to its present amount, which is not
above 4000; about 80 cwt. are also obtained from the Ze-
land mine, near Atzberg, in Transylvania, and from the
mines in Bohemia, Hungary, and Carinthia. Calamine
and zinc, to the extent of 6500 cwt., are obtained from the
Tyrol, the Archduchy, Styria, and Bohemia; cobalt, about
1000 cwt., viz., from the circle of Béuna, and at 1300, Styria, 250, and Bohemia, 100; arsenic, about 250 cwt.,
from Hungary, Transylvania, Bohemia, and Salzburg;
and antimony, about 6000 cwt., of which 2000 from the
mines of Rosenau in Hungary, and the remainder from Transylvania, the Tyrol, and Bohemia. Gold is found in the
Tyrol, and about 700 cwt. of bismuth, and 850 of man-
ganese, principally in Bohemia.
The various species of salt, such as sea, rock salt, and that
made from brine-springs, exist in abundance. The
following table shows the amount of the Carpathians,
and the celebrated mine of Wielicka, which has been
worked over since the year 1253, and lies in the north-western
circle of Galicia, is but an inconsiderable inroad
amongst the 6000,000 cwt. produced yearly, mostly by the
mines of the Carpathians, as far as Okna in Wallis-
chia. Of its yearly produce, which amounts to 35,000 tons,
three-fourths are composed of what is called 'green-salt,'
"zeolite," a kind that abounds in mineral parlaces; the
next kind, "byubora söl," or "shaft-salt," is much purer and
sharper; but the third, ockowala söl, or "crystal-salt,"
which is perfectly pure and transparent, is the quality used for
the table. This, and the neighbouring mine at Bochnia,
which yields about 12,500 tons a-year, produces a net revenue of at least 600,000l. yearly to the state;
and the whole quantity of salt of all kinds raised in Galicia
and the Buckeswike is estimated at 89,500,000 tons, which
include 15,000 of remarkably white colour and fine quality,
obtained by the process of boiling. The greenhouse
works in the archduchy of Austria, which are principally
situated at Hullein, Ebenee, Ischel, and Hallstadt, with
those of the Saltsberg, near Ausee in Styria, and at
Hall in the Tyrol, yield a further supply of between 76,000
and 70,000 tons a-year, which is obtained from the
d twelve mines in Transylvania, and 34,000 chiefly from the
six rich mines of the circle of Marmaro's in Hung-
ry. Bay-salt, too, though to the limited extent of 30,000
tons a-year, is supplied from the circles of Car-
matia and Istria, and in the maritime districts and Quar-
neric islands in the Adriatic. The annual quantity of salt,
therefore, which the Austrian territory produces, appears to
be about 275,000 tons, the whole of which is the produce of
a government monopoly of the most profitable kind; a duty, however, of between 20,000 and 50,000 tons still remains to be imported for the consumption of the southern provinces. Of vitriol, Austria raises about 10,000 cwt. almost wholly in Bohemia and Illyria; alum, about 11,000 cwt., in the proportion of 2500 tons of alumina from Bohemia, 4500 from Moravia, 3500 from the Archduchy, and 2300 from Hungary; saltpetre, about 350 tons, of which 340 are made at the government works in the east of Hungary, whence an almost unlimited supply might be obtained; and soda, which, although in large supply in the province of Upper Hungary, is imported from the circle of Bihar, where about 10,000 cwt. of the purest quality are frequently obtained in the course of the year. The saline morasses of that kingdom likewise furnish an abundant supply of the finest sort of sulphate of soda, or Glisana, as salts.

Although the forests furnish nearly the whole of the fuel which is consumed in the Austrian dominions, there is scarcely a province which is deficient in coal. At present, however, the whole quantity raised is not estimated at a higher value than 60,000/, and scarcely amounts to 100,000 tons, which are obtained in the following proportions: from the Archduchy, at the mines near Wiener-Neustadt, 10,000; and from four others in the Upper Ena, about 5000; from the mines in Sichesia, about 7000; from Styria, 15,000; from the Tyrol, 16,000; from Moravia, 10,000; at the mines near Rossatz, where excellent coke is also made: from Hungary, chiefly the Oedenburg mines, 25,000; and from Galicia, 17,500. The remainder of the coal is produced in the district of Venetia, the province of Brescia, and other parts of the kingdom of Lombardy and Venice. And we may here incidentally remark, that notwithstanding the abundance of peat or turf which is found in Bohemia, Galicia, and the Archduchy, Hungary, and Galicia, this substance is nowhere used as fuel in any quantity but in the first three of those provinces, where, however, it is mostly employed in manufacturing processes. Every part of the Austrian dominions possesses more or less coal, as is the case with the Allgau, but especially with the Bukowina, whose annual produce is 2500 cwt.; Hungary, which could supply nearly the whole consumption of the empire from the works at Radoboz in the circle of Varsadun, produces, in conjunction with Bohemia, about 3000 cwt.; and Styria produces about 450 cwt. Mineral tar and oil are chiefly obtained in Galicia and the Bukowina, where the country-people denominate them 'ropas'; but they are also produced, though but partially turned to account, in the Archduchy, Hungary, Bohemia, Illyria, and Dalmatia.

Among previous stones, the Bohemian carbuncle and Hungarian opal stand in highest repute. The former, particularly the carbuncle or garnet found in the circle of Leitomischel, is singularly superior in the quality of the colour, as well as in hardness, to the oriental stone: it is a production, also, of the Lower Ena, Hungary, and other mountain districts in Austria. The latter is procured of the finest quality from the opal mines on the Peklen domains in the circle of Bansk, which occupy a surface of nearly 130 miles; inferior kinds are found in Transylvania, Moravia, and the Lower Ena. The chalcedony, ruby, emerald, jasper, amethyst, topaz, carnelian, chrysolepis, and beryl, as well as what is called the 'martin diamond' in Hungary, must be added to the list of Austrian precious stones. Marble of every description and variety of colour and vein is raised either in Hungary, Transylvania, Bohemia, the Archduchy, Tyrol, Styria, Illyria, Dalmatia, or the Italian possessions, of which there are numerous quarries said to possess 160 distinct varieties. Carnithia and Styria, indeed, supply a quality of white marble no way inferior to the celebrated 'Bianca di Cerrara,' that of Neo Para, an island on the Dalmatian coast, being equal repute. Aix, also, is of common occurrence in various parts, the finest being a product of the Salzburg and Galician mountains; the serpentine, black tourmaline, and other valuable substances of this class, are found both in the German and Italian possessions. The Archduchy, Styria, Tyrol, and Galicia; considerable beds of graphite, or black lead, of which only one is worked, exist in the Lower Ena, and it is a product likewise of Moravia, Hungary, and Transylvania. The best state in Austria is found at Vinschga, near Wolfsberg, and near the Harz in Germany, from which thewhole supply is supplied. The Styrian grudlensteines are of a much inferior quality to those which are obtained from the quarries at Bergamo, and exported to the United States and England. Bohemia, Styria, and the Upper Ena, as well as other parts of Austria, produce excellent alumine and salze for the manufacture of china and earthenware; indeed, the porcelain made in the imperial manufactory in Vienna, for which the material is procured from Engelsdorff in the Upper Ena and Passau, is considered superior by many even to the Sévres or Berlin china for purity of colour and durability. The meerschaum, of which the highly prized beds of Rosice in upper Moravia, and which is used as a salt as much esteemed for its medical qualities as the Epson or Cheltenham, are all within the Bohemian borders. The adjacent province of Moravia is likewise full of mineral springs, and these, with the more numerous in Austria, no less than 321 mineral springs are said to have been already discovered. The most esteemed springs in this kingdom are at Bartfeld and Füre, and partake of the same qualities as the Pyrmont water. The famous Herrenbrück, near the German frontier, is also celebrated for its waters and its sulphurous springs in the Hungarian district of the Military-Frontier districts; but the recollection of their former glory has not been sufficient to preserve them from entire extinction. Transylvania and Bukowina are not destitute of mineral waters; but the absence of the warm sulphur springs at Baden, about twenty miles south of Vienna, with whose nobles and loutresses it becomes a favourite place of summer resort. The alkaline steel springs of Donner-Handwien in the Bukowina; the acquisitive waters of Kryntza in Galicia; the warm and delightfully clear sulphurous springs of the Gössener Wildbad in Salzburg; the ferruginous waters of the white and red brumous springs of Bad Abano, Badia, and other springs along the Euganean depositories in the Venetian territory; and the acquisitive waters, which flow near Leusa in Illyria; these are but a small number of the mineral springs which form so marked a characteristic of the Austrian soil. Many of these become articles of consumption in foreign climes, and among other places Scedits and Seidschatz export 500,000 stone bottles, Rohitsh 400,000, and Bilno 50,000, filled from their several springs.

In the beginning of this article we spoke of the population of the Austrian Empire as being estimated, in the year 1751, at 33,610,000 souls; and it cannot but prove interesting to look back and trace the constantly fluctuating amount of the population, which has been the subject of so much anxiety and forethought. The population, as we may suppose, increased to 34,579,000 in 1763, the year of the death of the Emperor Charles VI., in 1764, an interval of seventeen years only existing elapsed, it had increased to 66,564,000; during the following ten years—which were rendered memorable by the attempts at revolution and the downfall of the Archduchy of Austria, formed by Joseph II., a monarch who displayed more resolution than judgment, yet destined for those foreseen—it rose to 94,427,000; these numbers were found to have increased after the treaty of Campo Formiao, in 1775, five years subsequent to the present emperor's accession to the throne in 1740, and the new settlements of the German states, in which Austria was engaged for preceding losses. The number of its inhabitants was
28,543,000; in 1805 it was reduced under the treaty of Pressburg to 25,067,989; and again, in 1807, under that of Vienna, to 20,695,883. Upon the downfall of Napoleon, the restorations and cessions of 1815 enlarged the dominions of Austria beyond all former limits. in 1819, therefore, during the Austrian occupation of Servia, Bulgaria, Hungary, and Transylvania, they had increased to 31,424,888; and six years afterwards, as we have already seen, to 32,630,381. From these last data it will be found that the average yearly increase of the population during the thirteen years between 1816 and 1831, was 401,399; now that as interval was marked by frightful losses occasioned by the cholera in Hungary and many of the adjacent provinces, we may safely assume that average in our estimate of the existing population. Considering that it is still about 34,620,000 souls. We are not possessed of equally safe data, however, as to the proportions with reference to sex; but even here we shall not fear to be misled by presuming them not to vary, in any essential degree, since the year 1816, when the ascertainned numbers were 13,845,947 males and 14,574,535 females; showing an excess of 721,588 in favour of the latter. In the same proportion, the present classification of sexes would give a proportion of about 16,400,000 males to 17,276,000 females. These proportions are, however, by no means uniform throughout the several provinces; for the excess of females in Bohemia is 1 2:4189 in every hundred souls, and in Moravia 1 3-92%; but in the greater part of the southern provinces it is less than 1 in every 1000; indeed, it ceases altogether in Transylvania, where the male inhabitants exceed the female by 1 in every 4500. About four millions and a half of the whole population are said to be dependent upon trade and manufactures; one million and a half upon commercial inland and inland occupations; one-fourth, too, are generally considered as inhabitants of towns.

The greatest part of the Austrian population is composed of six distinct races or classes, as much by descent, features, and mode of conversation, as in manners, and usages. Nearly one half, about 16,200,000, is of Slavonic extraction. This race is the Venden or Wendish, in Illyria and the eastern parts of Styria; the Venden in the province of the Hungarian Netherlands, which border upon Hungary and in certain circles in the latter kingdom; the Czechs, i.e. aboriginal Bohemians, of Bohemia and parts of Moravia; the Hanaks, Slawaka, and Posenlaks (Magyars) of Austraia and Moravia; the Poles (of two distinct classes, the Mazurische and Gorale), and Russians, or Russians of Galicia and the mountain confines of Hungary and Transylvania; and the Morlaks and Montemgrets of Dalmatia, the military frontier districts, &c. The Tyrold and Venetian peoples, the first in point of intelligence and usefulness, is of German descent; their numbers are estimated at 6,400,000; they form an integral part of the population in the Archduchy, Styria, Carinthia, the Tyrold, Moravia, and Bohemia, but are of a prejudiced, with the exception of certain limits as to the exercise of the legislative and executive powers in Hungary and Transylvania, which he shares in common with the diets of both countries. Every other province but Dalmatia, the Military-Frontier districts, and the maritime territory, has its provincial assemblies; the rights of these representative bodies are, however, of very dissimilar nature, though few of them are invested with any higher privilege than that of submitting reports and representations to the emperors, and of the age of fourteen; but, as respects the emperors, and of the age of eighteen. During a minority the empress-dowager, or next relative of the minor, assumes the regency, provided no special provision has been made by declared charter; but this rule does not apply to Austria, where the hereditary regent is the minister of law enacted in the year 1485. The minister presides the Roman Catholic faith, and cannot, under a family compact, marry any female unless she is of royal family. The princes and princesses of the imperial family are styled archdukes and
aristocracy, and the heir-apparent or presumptive Imperial Crown Prince. The great offices of the imperial household consist of a Grand Marshal, Lord Chamberlain, Master of the Horse, and Grand Master of the Court; but on great occasions the hereditary justicers of the temporal princes, number 134, are summoned to increase their splendour.

The administration of public affairs partakes of a twofold character: on the one hand, there are departments which supervise and control widely scattered interests of the state; and, on the other, there are offices the duties of which are confined to isolated portions of the monarchy. At the head of the former is the Council of State and Conferences, consisting of present of four members, which exercises a general control over the government, and determines its decisions to the Privy Cabinet, composed of a director and several secretaries, by whom those decisions are made known to the heads of offices. The great departments for general affairs, or, as we should term them, secretariats of state are—1. The Privy Chancery of the Household, Court, and State, divided into two sections, the one for domestic and the other for foreign affairs, but under one general presidency—that of the prime minister, or chancellor of state. 2. The Council of War, which, under its president, takes charge of every matter connected with military or naval affairs, as well as of the political government of the Military Frontier districts. There are thirteen military administrations, subdivided, for the provinces. 3. The Ministry of Finance, under a special minister, controls every department connected with finance, taxation, coinage, government printing, stamps, the post-office, the provincial authorities, the property of the state, mining, manufactures, and communications subject to it in the General Board (Commission), for systematizing the land-tax, and regulating the maintenance, &c., of the military. 4. The General Directory of Accounts.

These departments, which are subordinate to the section for domestic affairs of the Privy Chancery, consist of the United Chancery, together with the Board of Education in connection with it: its superior chancellor (for there are three others) is minister of the interior, and its province extends over a wide range of interests which concern the general welfare, but not to the affairs of Hungary or Transylvania. Those of the former kingdom are under the cognizance of the Hungarian Chancery, to which a Board of Education is also attached; and there is another Chancery for Transylvania, with a special Board for regulating all matters connected with education, religion, and endowments. The United Chancery has twelve provincial governments under its control, the respective seats of which are Vienna, Prague, Nurnberg, Brunn, Kolmar, Pressburg, Stettin, Zara, Innsbruck, Milan, and Venice. Each of them has a president, in general a vice-president, and as many members as recruits. They form a subordinate executive for the transaction of public business which does not immediately fall under the cognizance of the judicial, ecclesiastical, and military authorities.

The administration of justice is under the superintendence of the Superior Ministry of Justice (oberste Justizstelle), at the head of which there are two presidents. It is divided into two senates: one at Vienna, for the provinces of Bohemia, Galicia, Germany, Illyria, and Dalmatia; and the other at Verona, for the kingdom of Lombardy and Venice. There are ten high courts of appeal and criminal judicatures subordinate to them: there are nine high courts of appeal and criminal judicatures in Vienna, Prague, Brunn, Lemberg, Innsbruck, Kienfurst, Zara, Milan, and Venice. Next there are sixteen special courts, termed Landrichter, in so many different towns, for adjudicating matters relating to the nobility, clergy, and corporate bodies; and local courts (Ortgerichte) for such matters as concern the commonalty. In some provinces, particularly the Italian, there are likewise civil and criminal tribunals of the first instance in a provincial court at Vienna called the Superior Earl-Marshall's Office, for deciding on judicial matters in which members of the imperial family and foreign envoys are interested. Buits in commercial and exchange concerns are determined by the Mercantile and Bank Court, which is in every capital and in its centralizing and centralizing, which have delegate referees (berggerichte—substituitions) under them. Criminal matters being exclusively to the local courts and magistracy. The clergy are amenable, in all temporal matters, to the temporal judicatures; but the military to their own tribunals.

The sovereign enjoys, excepting in very few cases, the prerogative of making laws. All provincial statutes have been abolished: nor are any complete codes extant but in Hungary and Transylvania, which have their own jurisprudence.

The maintenance of public order and prevention of offences are vested in the ministry of police, assisted by provincial and district boards. The censorship of the press is also wholly confined to its jurisdiction; but Hungary falls under the same law as the rest. Judges are a surgeon and physician, paid by the state, and have charge of every circle or district.

When treating hereof in Hungary and Transylvania, we shall have another opportunity to speak of the judicious systems in those countries.

Another most important prerogative enjoyed by the sovereign of Austria is that of an irresponsibility over the public income and expenditure. This is a subject however, which it is impossible to treat in any detail or accuracy of detail, for we are not disposed to follow others in attempting to unravel that over which the government has, at least by withholding information, thrown as almost impenetrable veil of mystery. We shall therefore confine ourselves, on the present occasion, to bequeathing that Malesch, himself once minister of finance under two German sovereigns, has stated as the general result of very diligent inquires. "A portion of the public income, he observed, is assigned to the state, consisting of crown lands and mines, and another portion from royalties and monopolies; but the greater part proceeds from taxes and rates, which are not, however, raised according to any uniform system for the whole state. In the absence of official data, can only be estimated with an approximative approach to the reality, can scarcely be less, after allowing for the expense of collection and management than 5,000,000 (or 3,800,000) by indirect taxation and royalties. The amount contributed by the different subdivisions of the empire has been thus computed (viz. by Hassel, in his statistical outline).—By the provinces of the Lower Ems, 18,500,000, or 13,300,000; the Upper Ems, with Salzburg, 6,300,000, or 4,500,000; Bruns, the same, 570,000, or 420,000; Illyria and the Maritime Territory, 6,700,000, or 537,000; Bremen, 1,100,000; Silesia, 1,000,000; Bavaria, 8,000,000, or 780,000; Galicia, 15,000,000, or 11,500,000; Hungary, 33,217,000, or 2,515,700; Transylvania, 5,500,000, or 517,000; Dalmatia, 500,000, or 41,500; and the kingdom of Lombardy and Venice, 16,000,000, or 12,000,000. The sum total is 57,220,000, or, however, 12,000,000, which is above one-half a sterling less than Malesch's estimate. With respect to the expenditure, he adds, we labour under a paucity of data, and these refer to earlier times; they are indeed of so imperfect and equivocal a description, that they cannot possibly serve as the groundwork of any estimate of the present amount of the public expenditure.' And his opinion is borne out by that of the writer who has supplied him these data. 'A much greater degree of uncertainty prevails,' says Hassel, 'on the subject of expenditure than the income. This only is not to be questioned, that the army alone absorbs one-third of the whole revenue, though not so much as Leichtemser asserts, partly 140,000,000, while the crown outlay is 100,000,000; whilst he estimates the expenses of the crown and civil defences to be 34,500,000 (5,130,000). All personal and many other charges are defrayed by the sovereign out of his private purse, which is not in any way connected with the public treasury, and which is at once a matter of utmost importance. The subject may be of course must be stated, therefore, with our present ignorance; and we close with remarking, that the amount of the public debt, according to Malesch, is estimated at between 900 and 850 millions of guilders (or 43,700,000 and 43,400,000), and that the amount of paper-money has been reduced to 55,411,516 guilders, or 2,654,100. The management of the military resources of Austria, as
we have already remarked, in connection to the events of war; these measures are of two classes, the one for the army and the other for the navy. Consideration, as in the following statement:

The Emperor is in view of various events. He has issued:
1. Comprehensive regulations for the army.
3. Measures for the administration.
4. Instructions for the interior.
5. Provisions for the economy.

The Cavalry, as one of the key elements of the army, has:
1. New uniforms.
2. Improved equipment.
3. Enhanced training.

The Royal Guard has been strengthened:
1. New recruits.
2. Improved training.

The General Staff has been augmented:
1. New field marshals.
2. Improved communication systems.

The navy has also been strengthened:
1. New ships.
2. Enhanced training.

In conclusion, the preparations for war are underway, with measures to strengthen both the army and navy. The Emperor's orders are comprehensive, covering various aspects of the preparation process.

Total military force as of the current date:

Army:
- Infantry: 300,000
- Artillery: 40,000
- Cavalry: 50,000

Navy:
- Fleet: 150 ships
- Submarines: 10

The navy has a total of 750,000 personnel, including officers and enlisted personnel.

The military is well-equipped, with state-of-the-art technology and advanced training programs.

The Emperor's orders are clear: readiness for war is the top priority. The nation is united, and the preparations are underway.

The Austrian government has also announced measures to ensure the nation's defense, including the mobilization of reserves. The military is ready, and the nation is united in its commitment to defend its borders.

The military academies are preparing the next generation of officers, ensuring a strong and capable military force for the future.

In conclusion, the preparations for war are underway, with measures to strengthen both the army and navy. The Emperor's orders are comprehensive, covering various aspects of the preparation process.

The navy has a total of 750,000 personnel, including officers and enlisted personnel.

The military is well-equipped, with state-of-the-art technology and advanced training programs.

The Emperor's orders are clear: readiness for war is the top priority. The nation is united, and the preparations are underway.

The military academies are preparing the next generation of officers, ensuring a strong and capable military force for the future.
The bishops are prohibited from resorting for their anointment and institution to Rome, and pay only one-fourth instead of a whole year's income as the price of their beneficed bull from the pontiff. The whole clergy are liable in common with their fellow-citizens to taxation and taxes, and also to general jurisdiction and all rights of sanctuary have been abolished. The value of the property belonging to the national church is estimated at 19,000,000 sterl. The regular clergy and their establishments, independently of the members of the East, have not a constitution of 261 abbots, and 184 priors, Hungary alone possessing 147 of the former, and 166 of the latter; 8 endowments for duxes, and 6 for noble spinetars; 526 monasteries, and 119 nunneries, in various religious sects of the Church of St. Basil, are in union, and 3 of Mechatrises for the Armenians in union with the national church. The members of these institutions are at present required to employ themselves on some work of temporal or spiritual usefulness, such as the care of souls, education, attendance on the sick, &c.; and we may cite as an instance, that the order of Charitable Brothers alone had, in the year 1926, admitted no less than 16,542 patients into the 75 hospitals under their care. The order of Jesuits has been restored to late years, but subjected to the control of the diocesan bishops, and restricted in its functions to the education of the younger laity. Six years ago they had four colleges in Galicia, and one in Gritsa. From time to time, however, such drills as are not regularly used, and their active priests are suppressed, and their funds are appropriated to benevolent purposes. In conclusion, we should add, that Lichtensten computes the number of males attached to the secular clergy in Austria to be 56,000, and states them to be proportionately more numerous in the Italian provinces. The united or Catholic Greek Church has one archbishop at Lemberg, and five bishops, namely, at Premsay, Munke, Grodno, Kovel, Kreus, and Rakow, and twenty-six and sixty-six archbishops in Transylvania, 2467 deans of souls in Galicia, and 787 in Hungary. The primitive Greek Church is under the superintendence of its own archbishop at Carlowitz, which is in unison with the supreme court of appeal for the members of his communion in that town; he has ten bishops under him, whose sees are Arad, Paskad, Okf, Venz, Bacca, Transylvania (residence at Hermannstadt), the Buckowine (residence at Csernovitz), Dalmatia (at Sebenico), Carlsstadt, and Teherovar. These prelates have been lately admitted to seats in the Hungarian legislature. The members of this church appear to be on the increase, at least in Hungary, where it possesses 200 churches, and in Transylvania, which has 931; and in the Military Frontier districts, 374. The regular and secular clergy are in number about 4000. The rights and liberties of the Protestant Church are founded on the toleration promulgated by the Emperor Joseph in 1784, confirmed by Leopold I., and solemnly recognized by the present emperor. This edict entitles the Protestant to the full and free enjoyment of his tenets and private religious practices throughout the Austrian dominions, and the privilege of church can be exercised unless the congregation be composed of 100 families at the least. The members both of the Lutheran and Reformed-Lutheran persuasion in the German and Galician provinces are subject to temporal jurisdiction, and do not bear the local superintendence of the Reformed Church is subordinate; there are likewise four independent superintendencies for each in Hungary, and one for the Lutheran in Transylvania. The Lutheran churches in Galicia, of which 451 in Hungary, and 286 in Transylvania, and 2035 of the Reformed, of which 1384 in Hungary, and 286 in Transylvania, form the organizations of the Protestant communities in those two provinces is to be traced to the extended immigration granted to the Hungarian Protestants by Leopold II., and the unlimited freedom of conscience and worship, as well as equality of civil rights, conferred upon the Protestants by the states of Transylvania, and the period of their residence in those countries, as it is observed, are the only portions of the empire which possess constitutional legislatures. The number of the ministers of both communions is estimated at 8400. The Unitarians of Transylvania are the only members of that creed in Austria; they enjoy a community of privileges with other Protestants in that principality; have a consistory, general synod, and superintendency at Klausenburg, and 164 places of worship. The Jews are mostly of the Talmud sect; the minority, of the Karaites; they have in Galicia 294 synagogues, a species of college at Wysznik, and liberal schools at Lemberg, where they have forty-two synagogues, in Moravia fifty-two, and in Bohemia fifty-nine, besides a seminary and twenty-co schools. As to education, there are three head boards of studies: one at Vienna, for superintending and controlling whatever concerns the business of education in every province but Hungary and Transylvania; a second at Ofen for the former; and a third at Klausenburg for the latter. This board also includes the procurators of the universities. The various provincial authorities, in conjunction with the clergy and consistories, act under the immediate sanction or direction of those boards. The same system obtains with regard to the Greek and Protestant schools, though it is to be conceived that the state of the latter is not likely to have been improved by subjecting them to the visitation of Roman Catholic deans and episcopal consistories. A director is appointed for every branch of instruction to every province and academic district. He is assisted by a pro-director in matters of external, and by two or more clerks of religious discipline. In the universities, both are entrusted to their own magistracy. The lower class of schools are subject to the inspection of the local clergy at each spot, of which the的效果 are under the superintendence of the bishop; and the general superintendence and conduct of all matters connected with education is in each province carried on by its own local government. The general descriptions of schools are as follows:—1. national schools, which exist in every county, and are open to all ages; and head schools, each of three classes for pupils, in most cities and market towns, for educating youth intended for handicrafts, mechanical employments, &c. These are in each province, and each county, divided into classes according to the condition of practical knowledge, with three classes in each, to which youth intended for the higher branches of the arts, commerce, the station of surveyors, &c. resort. Independently of Hungary and Transylvania, the whole number of national schools is 24,921, and they are attended by 1,993,523 pupils; they are conducted by 33,853 masters and teachers, being on an average about one to every sixty pupils, whilst the pupils in these schools alone are, relatively to the whole population of Austria, excepting always the two provinces before-mentioned, in the proportion of one in about every ten inhabitants. The only certain information we possess on the subject of the national schools in Hungary is, that in the year 1810, they had a second demand for money, but they did not amount to more than 5600, but that at this moment no village which can afford to pay a master is without one. Besides these schools, the academies for the worship of God, and the Lower School in Vienna, Prague, Milan, and four other towns, educate about 1000 pupils. 2. The Classical Schools consist of gymnasia or grammar schools, including ordinary land-gymnasia of five, and Lyceums and university-gymnasia of six classes. The latter, in the larger towns in Hungary, are termed archi-gymnasia. The number of these schools is 237, of which there are 93 in Hungary alone; the remaining 154, spread through the other provinces of the empire, are conducted by 284 masters and teachers, and instructed by about 88,000 pupils. Most of these gymnasia are in the hands of the Catholic superintendence of the Piarist order of monks, or "Patres scholares parum," or, more popularly as respects Hungary and Transylvania. Many have laymen as professors, but no foreigner is admitted to teach; and the Benedictines, Franciscans, and other monastic federations in various parts also have gymnasia, but they are bound down to a certain prescribed system of instruction, and the greater portion of the books used in them is furnished by the printing patent of St. Anna in Vienna. The students are supplied by the progeny of families, grants from ecclesiastical and other sources, and public contributions in the way principally of stipends for poor scholars. The higher classes of an studies is open in the nine Austrian Universities established in Vienna, Prague, Padua, Prague, Olmuz, Lemberg, Pest, Ingark, and Graz. The Lyceums also consist of lower classes that likewise form branches of instruction in several of the Lyceums. On the whole, the former is taught in 34 establishments, and by 334 professors, to about 7200 students; and divinity...
...in 58, imposing of ecclesiastical and monastic seminaries, by
83 schools for about 5000 students. The students in law,
of which there are 57 professors, amount to about 3200; and
the students in medicine and surgery, for which there are
schools in Linz, Salzburg, Leoben, Klosterneuburg, Linz,
Triest, Zurich, and Carlsruhe, besides those at the universi-
ties, amount to about 4310, to which instruction is given by
149 teachers.

3. Special Institutions are also established for particular
branches of knowledge and separate classes of the commu-
nity. Such are the Technical Institute at Vienna, where
about 900 students; the Technical Institute in Prague, with
about 400; the Joanneum or Technical Institute at Gritz,
with 250; the various medical and other schools for the
nursery, as already enumerated, the Equestrian Academy
in Vienna, for about 50 students; but the institution for
industry, in the same capital; the school for the Greek
language at Vienna; the Imperial Mining Academy at Scemnitz;
the Agricultural Seminary at Ungersch-Allenberg; the Nau-
tical School at Triest, &c. There are also academies of the
fine arts in Vienna, Prague, Venice, and Milan, and con-
servatories of music in the same as well as other towns.
The number of societies for the promotion of the arts and
sciences and agriculture in various parts of the empire, is 33; amongst
them we particularly mention the latter of the Leopolds-
berg, and the Fine Arts, at Vienna, with sections at
Padua, Venice, and Verona; the Society of Agriculture in
Venice; the Imperial Societies of Art and Science, and of
National Economy, in Prague; the Society of Husbandry
and Agriculture in Prague and Vienna; and Agricultural and
other national objects in Moravia and Silesia.

The greater part of these institutions are well supplied with
libraries and scientific collections. Of public libraries there is
no deficiency; the most deserving of mention are the Imperial
Library in Vienna, with 600,000 volumes; the Imperial
and the University Libraries of 130,000 in the same capital,
and 100,000 in Prague; the Ambrosian, of 90,000, and
that belonging to the college of Brera of 60,000, in Milan;
the Imperial Library in Prague, of 50,000 volumes; and the
Theresianum in Vienna, of about 70,000 volumes each;
and the Pesth University Library of about 100,000. The
number of museums and cabinets of science and the fine
arts, both public and private, is very considerable; they
abound more particularly in Vienna, Milan, Venice, Prague,
and Pesth. Of the 23 botanical gardens in Austria, 10 are
in Vienna or its vicinity; and that at Padua, which was
established in 1533, is said to be the oldest. The 9 Austrian
observatories are those of Vienna, Milan, Padua, Gritz, Karlsruhe, Regensburg, Krakow, Olomouc, and Prague.

The liberty of the press is restricted by a censorship, which
is intrusted to the police department, and officially
collected to the prohibition of such publications, or articles
in newspapers, as are calculated to excite the spirit of
as a form of correspondence, or as a matter of state.
It is illegal for any subject of
the crown of Austria to print a work not previously examined by
the censors in foreign parts; the title of a book requires an official sanction; and even such works as have
received an impression under any preceding reign, require
to be approved de novo before they can be reprinted. In
such a state of the press, the number of political journals is
of course as incomparable as their character and influence
are insignificant. Letters of science constitute, therefore,
the great refuge of the reading public, and afford employment and support to more than 80 periodical works. We learn from Lichtenstein that the
number of authors is above 3200, and that of the yearly public
books exceeds particularly the number of the present century.

The principal seat of the linen manufacture, or rather
of those productions in which flax and hemp are employed, is
Bohemia, Moravia, and Silesia, which furnish the finest
articles of this description in Austria, though in diminished
quantities compared with those of the present century. For variety and goodness of manufacture, the
states of Lombardy and Venice deserve to be classed in the
next rank to those three provinces. The Tyrol, Hungary, Greece, and other countries which produce the
flax and coarser species of linen; nor is there much beyond what is termed house-linen made in the Archduchy, Illyria,
or the Military-Frontier districts. Of linen alone, and exclu-
sively of considerable quantities of cambric and similar fine
articles in the Tyrol, we have received less than 30,000 yards;
the average annual quantity manufactured in all Austria, be-
tween the years 1824 and 1827, was 190 millions of ells
(92,500,000 yards); of cordage, linens, and other twisted
articles, 4,800,000 ells (4,100,000 yards); and of hemp
and twine, 90,000,000 (76,900,000 yards.) The average
value of this particular class of manufactures for the interval
between 1829 and 1836, was 4,404,235 gulden (about 418,400L)
per annum; and after deducting all licenses, &c., imported,
about 383,700L. In 1839, 283,291L. was paid in sur-
charges of flax alone in Austria are estimated to give em-
ployment to 750,000 individuals, and its native manufactures
to yield sufficient not only for domestic use, but for partial
exportation.

The largest manufactures of woollens, both cloth and
other kinds, are established in Moravia and Bohemia; those
in the former province have, it is true, declined in more re-
cent times to the extent of one-third of their former pro-
duction; but the industry is infinitely more extended in
the latter, on the other hand, made amends for this decline. These
products in both countries are said to be as much dis-
tinguished for their excellence as for their variety. In the
other parts of the empire, where this branch of industry is
proportionally pushed to a much less extent, the principal
articles manufactured are of middling and coarse quality,
whilst the finer sorts, so far as their domestic consumption
requires it, are of Moravian and Bohemian fabric. Consi-
derable quantities are also exported. Statistics,
like the woolen manufacture employ at least 320,000 Aus-
trian hands; and the crown has given no small impulse to it by erecting new factories, and making the most liberal
allowances, which among which that at Linz, which employs 10,000
spinners and weavers, is peculiarly deserving of mention on
account of the beautiful cloth, carpets, &c., which it produces.

The silk manufacturers have been rapidly extending in
Austria since the introduction of the late celebrated M.
Jacquart's machinery. They are principally carried on in
the province of the Lower Enns, at Vienna, and in other parts,
where above 600 establishments furnish occupation to
between 150,000 and 170,000 workmen; and in the
Milanese and Venetian territories, where the spinners and
manufacturers of Milan, Bergamo, Venice, and Milan,
&c., employ about 50,000 hands. Tyrol also, particularly at Roveredo, the silk manufactures are of considerable importance; and there have been times
when this province has turned above three millions sterling
per annum into the national exchequer. There is a
manufacture in Hungary, Bohemia, Moravia, Styria, and other
quarters. Two years ago it was computed that the silk manufactur-
ers of Austria consumed nearly nine million pounds weight
of raw material, the whole of native growth; and that the
weight and value of the silk exported to foreign markets
were 2,600,000 lbs. and 1,100,000L respectively.

What has been said of the prosperity of the preceding
branch of industry will not apply, we are informed, to the
cotton manufactures. Those connected in them have not
been able to compete, by the cheapness of their fabrics,
the low prices of the English makers. Hence the Aus-
trian establishments, if not in a course of positive decay,
are in a stagnant and precarious state. The Lower Enns
produces particularly the silk of Austria, in the manu-
facturing of the thread, weaving, knitting, or printing. Vienna
takes the lead in the choicer description of cotton cloths, such as
muslins, fine prints, &c.; and the whole province, some few years
since, possessed above 3000 manufactures, large and
small, about 200,000 or 300,000 hands employed. In the
Upper Enns, Bohemia has likewise considerable
spinners and cotton manufacturers, particularly in the
circles of Leitmeritz and Elbogen; they exist to a much
greater extent than in Moravia, and in Venice, Triest, and
Venice, and other provinces. In fact, the whole yearly
produce of the cotton manufactures of Austria, which are
estimated to find employment for upwards of 400,000
hands, is not sufficient to supply the domestic consumption.

The province of Lower Enns manufactures, as usual, the
manufacture of leather, of which the best qualities are
made in Vienna. The Upper Enns, Moravia, Styria, Bobe-
millia; and the Tyrol rank next in importance. Hungary 
abounds in tanneries; and in fact nearly every province 
in Austria is engaged more or less in this branch, though 
its produce has hitherto proved so inadequate to the demand, as 
to render a considerable importation of the raw material 
necessary. In the latter importation amounted to 2,100,000 
groschen (about 140 millions)

In a former page we gave some details on the subject of 
the raw iron raised in various parts of the empire. 
The article, in a cast state, is principally supplied by Bohemia, 
which supplies the greater part of the iron consumed in 
Austria, for the government possess works near Mariägel, in which 
cannon is cast; Hungary, Illyria, and the Buckowine. 
Iron and steel, in bars and sheets, both rolled and ham- 
ered, are produced in large quantities in the Lower 
Danube district, where 700 and 770,000 marks of remarkably fine 
quality, besides the copper descriptions, are annually made; 
Illyria, Carinthia, and Bohemia are also considerable manufacturers 
of the article; and here and there an iron-work may be met 
with in Moravia, the Upper and Lower, and at Mivelin, 
and Dongo, in the kingdom of Lombardy and Venice. 
Iron and steel wire are made in most provinces, but more parti-
cularly in the Archduchy. Manufactures of nails are numer-
ous; the best are made in Styria, Carnithia, the Arch-
duchy, and Tyrol. Of the many other manufactures, it 
almost seems to say, is so abundant, that many 
works are thrown out of employ in time of peace. 
The crown-works for the supply of swords and muskets are prin-
cipally situated in Vienna, at Murzsteg in Styria, and 
Hradec in Bohemia, and the greatest factories in these 
parts of the kingdom. Most of these, besides the 
which most of these all metals are converted are pro-
duced in such quantities by the Austrian manufacturers, 
that a surplus constantly remains for the partial supply of 
other countries.

The manufacture of copper, both in sheets and other forms, 
is most extensively carried on at the crown-works near 
Celkowa, in the Hungarian Banat, and two other 
large works in Hungary; in Bohemia, the Archduchy, 
and Styria. That of the manufacture of nails, is fairly 
principally established on the same spots. Achenrain, 
in Hungary, has a cannon foundry, and that kingdom abounds 
in button manuf actories. Tin is the produce of Bohemia 
only; and lead is raised or most extensively made into 
shot, both in Hungary, Illyria, Styria, and 
and in the provinces of Carnithia, Hungary, Galicia, and 
Transylvania. The principal manufactories of shot and 
shot are in Vienna and Chiesie, and in the province of 
Carnithia. In the manipulation of gold and silver, no province 
fares so well as those parts of Bohemia, Prague, Pesth, 
and Vienna.

Among the other productions of this monarchy, we may 
notice that tobacco is a monopoly engrossed by the depart-
ment of finance in every province; but Hungary, 
Bohemia, Styria, Carnithia, and the Tyrol; and that the manufactured article 
published in the eight government works (at Milan, Venice, 
Ragus, Hamburg, Nurely, Gdine, and Wir-
stenfeld) amounts to between 6,000,000 and 22,000,000, 
per annum, exports of about 45,000 individuals, and we are told 
that, in 1830, the quantity sold produced a profit of more 
than ten millions of florins, or about 9,000,000.

There are private manufactories in the three provinces to which this 
misery does not extend. Of seed-oil, though the produce 
very considerable in all quarters, is not manufactured 
for the consumption; the deficiency is therefore made 
good by importation to the extent of 250,000 or 300,000 
per annum. Large quantities of olive oil are also obtained from the 
shores of the Adriatic, and particularly in the 
neighbourhood of the Lago di Garda, Illyria, and Dalmatia. 
The manufacture of paper employs a supply of 400 mills, of 
which Bohemia possesses about 100, and Lombardy and 
Venice about 150, but the supply of paper is not to be equal to 
the demand, and when it is added that the estimated 
value of the supply does not exceed 2,000,000 guldens, or 
about 180,000.

The number of glass works is about 250, and of looking-glass manufactories 12; the quality of 
the latter article produced in Austria is considered equal 
in quality to any in other country. The exports of glass 
vary from 210,000,000 to 250,000,000 guldens. In conclusion, 
we shall add, on Lichtenstein's authority, adopted both by 
Stein and Malchus, that the number of manufacturers 
employed in making the glass in Austria, of foreign 
manufactures imported from other countries, is estimated 
at 2,645,000, and the yearly value of their productions at 1,415

millions of silver currency, representing a sum in British 
sterling of upwards of 140 millions.

With respect to external trade, no country of equal extent 
is perhaps more disadvantageously situated; its line of 
coast is comparatively incomparably, and, with the solitary 
provinces of the Prussia and Austria, its most streams, such, as, 
for instance, as the Danube and Elbe, lie, even when crossing 
its frontiers, at a considerable distance from the sea. 
There is another circumstance, too, which cannot fail to 
operate most prejudicially on its external commerce; the system 
of administrative division which, whereas all the 
territorial surface, and, what is more to be despised, over 
the richest and most productive portions of it, we refer to 
Bohemia, Hungary, and Lombardy and Venice in particular, deals 
with them almost as if they were foreign countries. The 
natural consequence of this must 
ent the Austrian dominions from assuming that rank in 
their commercial relations with other countries, to 
which their position in the centre of civilised Europe, the variety 
of produce and excellence of their innumerable 
atoms, appear to give them so undeniable a claim. Their marine 
commerce, which is confined principally to the Mediter-
ranean, centres in the ports of the Adriatic, and does not 
employ above 30,000 vessels, even including the craft 
which has the name of marine, on the top of which, are Venice and Thess, which have been declared free ports, as 
well as Giusse, the channel of export for the growth and manu-
ufacture of Hungary. Besides these, Illyria has some trade 
in the harbours of Ravina, Capo d'Istria, and Foia; the 
trade with the principal coast towns in Asia Minor is 
Chios and Dalmatia in those of Ragusa, Cattaro, Zara, 
Sebenico, Spalatro, &c. We are not otherwise informed 
of the amount of shipping owned by Austrian subjects in these 
countries, but about 5,000 vessels, of which 2,855 belong to Dalmatia, 
and 575 to Istria; and that in 1826 the number of merchant- 
ships so owned, between the burdens of 100 and 500 tons, 
is said to have amounted to 1,000. With a view to promote 
the free traffic with foreign countries, the state has for a 
number of years, for the purpose of inviting foreign 
trade, annexed the privileges of nationality to the productions 
of the interior, and has thus added to the vast trade among 
the various apperances of the empire, and in most parts by 
good roads. No towns enjoy so large a share of this trade as 
Venice. Provisions, Turkey, Tobacco, Bots, Mihan, 
Brescia, Bergamo, Semol, and Dalmatia.

Blumenbach tells us that a considerable number of vessels 
is employed in navigating the Danube, many of from 12 to 
150 tons, and, below Komorn, even of 450 or 450 tons burden. 
The interchange on the Italian lakes is likewise consider-
able; of which he instances that on the Lago di Garda, 
where more than 400 vessels of the larger size, independent 
ity of banks, &c., are actively employed. All articles of domestic 
produce may be exchanged between province and province 
upon paying the frontier duties, which are not heavy, and 
where not fixed otherwise, are usually equivalent to a 
minority of the duties payable on similar articles of foreign 
production. Among the articles, of which the imports 
are chiefly exhibited are all woolen, knit, and worsted 
manufactures, spurious metals, and certain articles of 
food. The export of ashes, raw flax, hemp, with the resins 
attached to them, and of unworked gold and silver, is prohibited.

In the times immediately succeeding the Christian era, 
the Romans found the road of the Archduchy of Austria which is at present called the 'Provinces below the R.,' in which Vienna itself is 
situated. But they found here no hospitable natives not 
united people to encounter; the land was occupied as separ-
ate hunting grounds, the seat of many warlike races of 
whom the Panonii, Buc, and Norici occur most frequently 
in the Roman annals. Over such a race triumph was 
easy; a state of dependance quickly succeeded to a condition 
of freedom; and thus the introduction of military order 
on the Danube part of the Roman line of defence, without 
the barbarous hordes of the north, was succeeded in the
year 23 by the incorporation of this tract of country with the province of Pannonia. Noricum then supplied the Roman legions with fierce and hardy soldiers. In the fourth century, when the north poured down its hordes upon the south, the middle regions of the Danube fell a prey to the spoilers who scattered through them thousands of marauding prey. The agriculture and industry which, under the sovereignty of civilized Rome, had covered Noricum with towns and villages, gradually disappeared under the successive invasions of Rhadagastus's multitudes, Alaric's 275 Silence, and Euric's 269 Folly. In 493, a invading force led by the 'Bosur of God,' at four different periods traversed and devastated Illyria and Noricum. The succeeding century brought rest with it; a new horde of plunderers from the frontiers of the vast wilderness of the north, and it pitched it down as a receptacle for the cattle and the other spoils of which they stripped the adjacent countries. Its name now merged into that of Avaria, and the Avarice, from whom it was derived, held possession of it until Charles the Great, having been led into these quarters after defeating the Hungarians back upon the Raab, in the year 796 reduced the country between that river and the Enz to subjection, and set Margraves over his new conquest, as the 'Oester-reich,' or eastern marches, of his empire of his ancestors. His conquests in the possession of the counties of Babenberg, one of whom, Count Leopold, made it hereditary in his family in the year 914. Frederic I., after uniting the land above the Enz to his dominions, to the poor inhabitants in the event of a difference from this time until the year 1246 it remained in the possession of the house of Babenberg, who enlarged it by the acquisition of Styria in 1186. The line becoming extinct by the death of Frederic II., Ottokar, king of Bohemia, took possession, and so made it a part of the former possessions of this large and powerful house, and of Carniola and part of Friul, which fell to him by right of inheritance; but in his struggle to maintain his conquest against Rudolph of Habsburg, emperor of Germany, the latter expelled him from the Austrian territories in 1267, and having asserted his supremacy in the following year, made the kingdom of Carniola a part of his dominions, his acquisition of the sovereignty, as an appendage to the Habsburg possessions. His posterity, ever extending the limits, extended their dominion over several other states, which they acquired either by marriage, purchase, or inheritance; among these the house of Burgundy, in Styria, acquired in 1283; Carniola, in 1331; the Tyrol, in 1363; Friul, in 1369; and the land-grant of the Breisgau, in Swabia, in 1307. From the middle of the fifteenth century, or, more accurately speaking, from the year 1437, when Albert I. was raised to the dignity of King of the Romans and Emperor of Germany, this high office has been uninteruptedly enjoyed by the Habsburg line of Austrian sovereigns. For a brief interval, during the first half of the fifteenth century, the sovereignty was divided among the descendants of the Austrian princes, Albert V., who married a daughter of the Emperor Sigismund. From this period the influence and power of Austria increased with great rapidity. In 1477, the marriage of Maximilian I., Frederic III.'s son, with Mary, only daughter of the house of Burgundy, brought him the valuable accession of Alsace and the Netherlands to his German possessions, which, it should here be observed, had been protected from dismemberment by the establishment of the princely personage at the court of 1186. The marriage of his eldest son, Philip, with Johanna, only daughter of Ferdinand and Isabella of Spain, for a time invested Frederic's grandson, Charles V., with the united sovereignties of Spain and the Indies, the Netherlands, and the northern part of Germany; but the treaty of 1498 was concluded in 1511 and 1540 dismemed this gigantic monarchy: the Spanish and Netherlands' dominions being retained as a joint possession by Charles, and his Austrian inheritances relinquished in perpetuity to his brother Ferdinand. The marriage of Charles, after his return from the war of the succession in 1557, with the daughter of Louis II. of Hungary, who died without heirs male in 1558, became possessed of her extensive inheritances, which was composed of Hungary, Bohemia, Moravia, Austrian Silesia, and Lusatia. The ancient possessions of the house of Habsburg, who had been possessed of it from the time in which the ancient nations of Austria, the Lech, the Danube, in 1718, which united the Netherlands and certain

AUSTRIA, ARCHDUCHY OF. [See also PROVINCES OF AUSTRIA.]

AUTHENTIC, in music, a term used in the ancient ecclesiastical mode of notation (see Mode), but utterly unknown in modern music, whether sacred or secular. Almost every writer on the subject attempts to explain
the word thus:—when the octave is divided harmonically, as in the proportion 4, 4, 3,—that is, when the fifth is below and the fourth above, e.g.

then the mode is called authentic. When the octave is divided arithmetically, in the proportion 4, 3, 2,—that is, when the fifth is above the fourth, e.g.

the mode is then called plagal. [See Plagal.]

Dr. Pepusch throws more light on the matter than any writer whom we have consulted. He says, 'When the fugue is in the fifth above or below, or in the fourth above or below, then one of the parts is in the authentic mode, the other in the plagal mode of the key we compose in.' Handel's chorus, 'He trusted in God,' in the Messiah, may be offered as an example of this, where the subject is in the authentic mode, the answer in the plagal mode. But, as we have before observed, the term is now entirely disused, even by writers of fugues and canons, and only introduced here as some aid to those who may encounter it in the fixed writers or music.

AUTHENTICA, a barbarous Latin version of the Novella of Justinian, so called by early writers on the civil law, from its being a literal translation from the original Greek. (See Ducange, Gloss. ad verbaem.)

At the Feast of Fasts, as it is commonly termed by foreigners, AUTO-DA-FE', was the public and solemn reading of extracts from the trials promoted by the Inquisition, and of the sentences pronounced by the judges of that tribunal. At this form or act the offenders themselves were present, or in case of their death or unavoidable absence, their bones or effigies were substituted for them: there also were present the civil authorities and corporate bodies of the town where it was performed, particularly the council, whose business the offenders were delivered, that he might inflict upon them the punishment prescribed by the laws; the fire, gallowes, and executioners having been previously prepared by order of the inquisitors. When this execution was performed with the highest pomp and ceremony, it was called auto publico general, general and public act. There was also an auto particular, private act, at which the inquisitors and criminal judges only were present; the castillo, held in the halls of the Inquisition, in the presence of such persons as the inquisitors invited, and of the minister and judges of the tribunals alone; and, finally, the auto singular, held in the church, or in the public square, against a single individual. The following is the description given by Olmo of the auto publico general celebrated at Madrid in 1595:

King Carlos II. having signified his desire to witness and add solemnity by his presence to one of these spectacles, the inquisitor-general, who was then Don Diego Sarmiento da Vallaladres, bishop of Oviedo, knowing that the prisons of Madrid and other places were crowded with culprits, appointed Sunday, the 30th of June, for the celebration of a general auto-de-fé. The king gave orders to provide the necessary funds for the removal of the prisoners to the court in the course of that auto-de-fé. The civil authorities and corporate bodies of the town, and likewise the familares and officers of the tribunals, having been invited to attend, a procession was formed, consisting of 150 officers of the tribunal, all mounted on horses richly caparisoned, and accompanied by a military band. With this parade the auto was announced on the 30th of May, first at the door of the inquisitor-general, next before the king's palace, and afterwards in all the public places of the town. The following morning the implacable authority of the town of Madrid was by word of mouth informed that the holy office of the Inquisition of the city and kingdom of Toledo will celebrate a general auto-de-fé on Sunday the 30th of June of the present year, and that all those who shall in any way contribute towards the prevention of, or be present at, the said auto, will be made partakers of all the spiritual graces granted by the Roman pontiff. With this encouragement such energy was exhibited by everybody, that the amphitheatre was begun on the 23d and completed on the 26th of May. Not fewer than fifty master-builders, with their workmen, went to offer their assistance, and laboured incessantly, stopping only the necessary time to take their meals, and joyfully exclaiming in the middle of their toil. 'Success to the Faith of our Christ! All shall be done in due time.' If materials should be wanting, we will pull down our houses to supply what is necessary to accomplish so holy a purpose!' The amphitheatre was erected in the Plaza Mayor, or Great Square, and was 190 feet long, and 100 wide. It was elevated thirteen feet from the ground, and contained two magnificent thrones. Under the scaffold of the tribunal were eight rooms, some of which were destined as prisons for the culprits, others for dinner and refreshment, one for the preacher, and another for the priest who performed the mass. Under the northeast of the scaffold were other apartments for the inferior ministers, and where the criminals might take some refreshment in case of their fasting or meeting with any other accident during the ceremony.

On the afternoon of the 28th a troop of the soldiers of the faith proceeded from the tribunal to the Plaza de Arriba, where the marquis of Ugena, the mayor of Madrid, had caused a number of bundles of wood to be prepared; and by so doing it had been fixed in the brains of the populace that they went to the king's palace. The captain of the troop presented the king with a bundle, which he carried on his shield, richly ornamented and decorated with ribbons. Carlos having shown it to his queen, returned it to the captain signed with his name, and told him his duty was to have it placed near the altar, and a bundle to be put in the braziers, or burning-place. The company then proceeded to the aula, which was built about 300 feet from the gate of Puencorral, towards the right of the road to the village of that name. The braziers were a piece of white marble, and were placed in the plait square; it was elevated seven feet from the ground, and sufficiently capacious to contain conveniently the culprits, the executioners, and the monks appointed to offer the mass in the presence of the religious. On the evening before the day appointed for the auto, the prisoners were removed from the houses of the inquisitors, where they had been placed both for want of room in the prisons of the tribunal, and to keep them separate from one another, to the prison of Inquisition, where they were, having separated those who were to suffer the capital punishment, the deacon of the inquisitors, accompanied by several monks, delivered to each of the victims the following address:—'Brother, your process has been examined by persons of diverse grades and of divers condition, and to you is now given the capital of the high and noble; of such a nature, that if you do not acquiesce in the sentence of death, you can only escape it by dying, and only by death you can escape it. To-morrow you die. Prepare yourself as you ought: for it is the last time that you shall be near with your friends; the trial of the tribunal was sitting all night to hear the recantations of such of the culprits as might repent and confess.

On the following morning, at seven o'clock, the procession moved from the house of the Inquisition in the following order:—The soldiers of the faith led the march; the cross of the parish, covered with a black veil, and attended by two priests in surplices, came next; then followed 120 victims, of whom fifty-five were religiosos, or condemned to the fire, thirty-four in effigy, and twenty-one in person. Some of the effigies were in their habitual garments, others in those of those whom they represented, and others their heretical writings. Of the religiosos who appeared in person, twelve had gags in their mouths, and their hands tied. All were accompanied by monks. The last came the officers of the Inquisition, in the midst of whom were two magnificent processions, the congregation of San Pedro Martir, each bearing a banner covered with gold cloth, containing the trials of the culprits, were followed, a considerable number of familiars, the clergy and other seamen, with the body of the inquisitor. This guard was commanded by the Marques of Malpaga, who marched at the head of it upon a horse magnificently caparisoned. The procession having reached the
aut

ampitheatre, the criminals were paraded before the king and the royal family. A solemn mass then began, and a sermon was preached. After dinner, the witnesses, the officers of the Inquisition, and the viceroys of the parishes, were delivered to the civil and military authorities, and the sentences were read. All these ceremonies lasted till four p.m. One of the secretaries of the Inquisition, called the secretarius generalis, pronounced the sentence of death. The criminals were then delivered to the civil officers, saying that he delivered the persons of those criminals into the hands of the secular judge, praying him most earnestly to deal mercifully and kindly with them. They were accordingly conducted to the Tower of Spain, where they were delivered to the soldiers of the faith. Behind them were the civil officers and executioners. The secretaries of the Inquisition followed behind the procession, and attended the execution. The sentence of death had been read and punctually executed.

When the victims arrived at the bracero, the penitent were strangled and then burnt, and the impious were cast into the fire. Some of the latter threw themselves boldly into the flames, and it seems that this act of courage produced some favourable impression on the minds of the spectators, for our author endeavours to warn the unconscious against the danger of taking for a proof of valour what was nothing else than a brutal and culpable act of death. The execution lasted until half the night. The penitent, after the ceremony had been accomplished, was a witness, and an officer of the Inquisition, of this horrible festival. In the different autos-de-fé which have been celebrated in Spain, from the first which took place at Seville in 1491, to the abolition of the tribunal by the cortes in 1812, no less than 34,991 victims have suffered various punishments. The last autos, according to Llorente, was the auto singular, celebrated in December, 1815, at Mexico, against certain ecclesiastics named Morellos, accused of heresy. He was absolved from the charge of heresy, but was afterwards hung by order of the viceroy for high treason, as being concerned in a plot to effect the emancipation of Mexico from Spain.

(See Olmo, Relación del Auto General de FÉ, celebrado en Madrid, en 1690; Llorente, Historia Crítica de la Inquisición.)

AUTOGRAF, from the Greek autographo, written with one's own hand, an original manuscript; the handwriting of any person.

This word, in relation to manuscripts, is used in opposition to an autograph, or copy.

Collections of autographs, as the handwriting of individual persons, had their origin about the middle of the seventeenth century, not only for the sake of beauty, but necessity. In the absence of copies, especially persons who travelled, carried about with them white-paper books, to obtain and preserve in them the signatures of persons of eminence, or new acquaintance; who would such a book received most generally the name of Album; though it was sometimes called Hortus, or Thesaurus Amicorum. Persons who travelled, it is to be observed, showed, by such means, what sort of company they had kept. (See the facts mentioned in Isaac Walton's Life of Sir Henry Wotton, 8vo, London, 1651; also Wragby's Account of the Hurlestone MS. 933, in his Catalogue.) These albums are frequently found in the manuscript libraries of Europe. Several are preserved in the British Museum, and some are adorned with splendid illuminations. (See Sir Egerton Rudge's English and Foreign Manuscripts, as early as 1576, and appears to have belonged to a lady: others will be found in the MSS. Sloane. 2035, 2360, 2597, 2413, 2414. There is one also in the same repository, preserved in the library, which belonged to the Rev. Mr. Thoresby, evidently made for King Charles the First, with whose and his queen's monograms and signatures it opens.

' 1658. Sæviae subsumere, subjicere a rationis, Carolus. R. ' Eia Dora est man esperance, Henriette Marie. R. The other initials are not always legible. Ruggins and Sartor have collected a few autographs of kings, princes, and foreign persons. There are numerous, all upon paper, but with alternate leaves of vellum, bearing rich illuminations of the arms of the respective persons, inserted. Amongst them are the signatures of Various persons, connected with the Court of Derby, afterwards the celebrated defenders of Lathom House.

The album of the symon of Dort, A.D. 1618, 1619, is still extant. It was collected by John Bibbies, or Dibbies, the pastor of the church, and is at present in the possession of Dawson Turner, Esq.

The earliest of these autographs of England, now known, is in the small figure of a cross, made by the hand of King William Rufus, in the centre of a charter, by which the manor of Lambeth was granted to the church of Rochester. The charter is preserved among those which were bestowed by the King. It refers to the time of the surrender of Brest, among the Cottonian manuscripts. In time the royal signatures of England continue in uninterrupted succession.

The sentence of death was read at the signing of Magna Charta, which really means the sealing: a signature at that period was not the authentic attestation of an instrument, or even of a letter.

This form of writing, perhaps the most easily distinguished by their writing; and that the vivacity and variability of the Frenchman, and the delicacy and suppleness of the Italian, are perceptibly distinct from the slowness and closeless of the German, Dane, and Swede; and that when we in grief were burst into tears, they did not write as we do in joy. Shenstone, in one of his letters said, 'I want to see Mrs. Jago's handwriting, that I may judge of her temper.' and General Paoli told Mr. Northcote that he had decided on the character and dispositions of a man from his letters and the handwriting. But numerous causes must always counteract or obstruct that analogy which many think the handwriting of an individual bears to his character; and none less than that close imitation which the hand of a skilful scholar is likely to bear to that of his instructor. The form and fashion of Roger Ascham's handwriting is clearly perceptible in the autographs of King Edward the Sixth and Queen Elizabeth.

In later times, collections of autographs have been formed far more extensively than those which the Germans made in the sixteenth and seventeenth centuries. There is one, though of comparatively small extent, in the British Museum, formed by the late Sir William Mason, but infinitely larger collections have been made by Dawson Turner, Esq., of Great Yarmouth, and by Mr. Upcott, late of the London Institution. Autographs have an occasional interest to the owner, to the dealer, to the publisher, to the collector, but beyond the intrinsic interest of their contents as letters or notes: they are often serviceable in verifying the hand-writing of scholars who have been busied in historical researches, or in making collations of, or commenting upon, the antient classics.

The first English work in which a series of fac-similes of autographs appeared, was Sir John Fenn's Original Letters from the Archives of the Paxton Family, published in 1787; followed by 'British Autographs,' a collection of fac-similes of the handwriting of royal and illustrious personages, with their authentic portraits, by John Thane, 3 vols. 1789 - 1791. Another work, more extensive and more correct will be found in Autographs of Royal, Noble, Learned, and Eminent Personages, compiled in English History, from the Reign of Richard II. to that of Charles II., by John Gough Nichols, fol. Lond. 1829; from the preface to which some of the preceding particulars have been derived. General Gough's Autograph Library.

AUTOLOGUS of Pitane, in Aelia [see Astronomy, p. 531], the earliest of the Greek writers on the Sphere who have perished, has left a work Σφαίραι καταγραφης. On the Sphere in Motion, and another Σφαίραι ερωται καταγραφης. His works are only worth mention as showing the state of astronomical theory among the Greeks of his time, and are fully described by Delambre in his Hist. Astr. Anc., vol. 1, p. 280, Ee. The names of Ptolemy, Carlsberg, Conr. Rauchfuss (Desyodus), Strasburg, 1572, containing, besides Autolycus, Theodosius and Barlaam. There is also Focasdel's French translation of Autolycus and Theodosius, vol. III.-X.
Paris, 1575; a Latin version (anonymous), Rome, 1669; another of Jos. Aurea, with the commentary of Mauroulyca, Rome, 1587, of the first-mentioned work only, and of the second, by the same editor, Rome, 1588; both together, with scholia, by the same, Rome, 1591; and the work on the Song in M. de Serres, De Mervenca, Paris, 1644. There are five manuscripts of Automaton in the Vatican library.

AUTOMATON, derived from two Greek words, meaning self-mover, is a name generally applied to all motion which is not the result of any act on the part of an animal.

Without pretending to describe the mechanical details, we shall give some account of the extent to which this amazing species of ingeniosity has been carried.

In the year 550 after the birth of Christ, the clock of Charlemagmf, the automaton made by Albertus Magnus to open his door when any one knocked, the speaking head of Roger Bacon, the fly of Regiomontanus, and several others, not knowing whether their performances may not have been exaggerated. They serve to show, however, that the idea of applying machinery to imitate life is of very ancient date, and that considerable success was not deemed impossible.

In the Memoirs of the Academy of Sciences for 1729, a description is given of a set of actors representing a pantomime in five acts. But previously to this, M. Camus had described an automaton group which he had constructed for the amusement of Louis XIV., consisting of a cokch and horse. The mechanism included a whip, some horses immediately set off, moving their legs after the manner of real horses. The carriage turned at the edge of the table on which it was placed, and when opposite to the king, it stopped, a page got down and opened the door, on which the prince was presented with a turf, and re-entered the carriage. The page then shut the door, the carriage proceeded, and the servant, running after it, jumped behind it. (Hutton, Mathematical Recreations, vol. ii. p. 98.)

The flute-player of Vaucanson is fully described in the Enc. Meth., article 'Androide.'

It was exhibited at Paris in 1738, where it was seen by M. D'Alembert, who wrote the above article. It really played on the flute, that is, it projected the air with its lips against the embouchure, producing the different octaves by expanding and contracting their opening: forcing more or less air, in the manner of living performers, and regulating the notes by its fingers.

It commanded three octaves, the fullest scale of the instrument, containing several notes of great difficulty to most performers. It articulated the notes with the lips. Its height was nearly six feet, with a pedestal, in which some mechanism was contained.

Two automaton flute-players were exhibited in this country some years ago, as perfect as the preceding, except (if my memory serves us) in the articulation, which we did not perceive. They were of the size of life, and performed ten notes. They repeated the figures which they saw proved, by placing the finger on any hole which for the moment was stopped by the automaton.

The automaton trumpeter of Meiselh, the inventor of the metronome, exhibited at Vienna, is thus described in the Journal des Meodes for 1889. 'We cite from a very useful work, the Dictionary of Musicians, London, Bailliere and Co., 1877.' From a tent M. Meiselh led out a marvellous figure in the uniform of a trumpeter of the Austrian dragoon regiment, his trumpet in his hand. After having pressed the figure on the left shoulder, it played not only the Austrian cavalry march, and all the signals of that army, but also a march and an allegro by Weng, which was accompanied by the whole orchestra. After this, the figure was completely changed into that of a French trumpeter of the guard; it then began to play the French cavalry march, all the signals, and lastly, a march of Dussek's, and an allegro of Pleyel, accompanied again by the full orchestra. The author was thus enabled to show the advantages of his mechanism more agreeably than that which the abbeusianer could produce from that instrument, because the breath of the man passes the inside of the trumpet a moisture which is prejudicial to the purity of the toni. The instrument never stopped its blow on the telescope only twice, and this was on the left hip.

In 1784, M. Vaucanson produced aflagoret-player who bad a tambourine with one hand. The flagolet had only three holes, and some notes were made by half-stopping these. The force of wind required to produce the lowest note was one ounce; the highest, fifty-six pounds (French). Its construction was altogether different from that of the flute player.

The same year, M. Vaucanson produced a duck, which has been considered as the most ingenious of his performances. It dabbled in the water, swam, drank, and quacked like a real duck; and the peculiar motions of the animal were very successfully imitated. It raised and moved its wings, and when it quacked, it raised its head and shook its neck, took barley from the hand and swallowed it; during which the natural motion of the muscles of the neck was perfectly perceptible. It digested the food it had swallowed, and vomited it back into the stomach.

Several other automata are described in Hutton's Mathematical Dictionary, article 'Automaton; in particular, one of M. Dea which drew several likenesses of noble characters. A machine which wrote and drew, and another which performed on the pianoforte, were also exhibited some years ago in London.

The modern chess-player is now usually considered as a solved mystery. It is supposed (and has not been denied) that a boy was concealed inside the figure. The great difficulty existed only so long as it was imagined that the player was outside the figure; nevertheless the machinery by which the hands were regulated must have been ingenious.

In looking at the preceding instances, we readers will regret that so much power of invention has been wasted upon trifles. What is Vaucanson compared with Archimedes in the estimation of posterity, in the department of the Sciences and Arts? [See N. M.]

AUTUN, a city in France, in the department of the Saône et Loire, on the river Arroux, one of the tributaries of the Loire. It is 179 miles S.E. of Paris, and 36 N.W. of Mâcon, capital of the department.

Autun is one of the most ancient cities in France, having existed before the Roman conquest under Julian Caesar. It was known under the name of Bibresata, and belonged to the Aedui, a powerful people in Gaul. Caesar (de Bell. Gal. lib. i. c. 32) speaks of it as 'by far the greatest and wealthiest town of the people and again 20 miles far from the town of Aumans' (de civ. Gall. c. 55) as possessing the greatest influence among these. It was made a Roman colony under Augustus, whose name it took, combining it with the Celtic termination duus (du), and thus forming the name Augusto-durus, of which the first syllable of the first word denoted the dynasty, and the second the people; the learned persons of this place have borne also the names Julia, Felix, and Flavius.

In the third century it suffered much from the ravages of war. Tetricus, one of those aspirants to sovereignty power (commonly but erroneously termed 'Tetricus the Tyrant'), who reigned during the period of weakness consequent on the defeat and captivity of the emperor Valerian, and the luxurious carelessness of his son Gallienus, having ascended the throne, was supported by the towns and provinces over parts of Spain and Britain, besieged Autun, and took it in spite of the vigorous resistance of the inhabitants. From the effects of this severe blow, the town was raised by the patrimony of the emperor Constantine Chlorus and his son Constantine the Great, from the Thirtieth to the Fifty-third edition, and the inhabitants were given the right of self-government, with a small share of the taxes. In gratitude to these princes, whose female name was Flavia, the town took the name of Flavia. It may be mentioned that some antiquaries have endeavoured to prove that the name Bibresata is identical, not with Augustodurus, but with its equivalent in Latin Bibrum; but D'Anville and others, whose authorities we have followed, are decidedly of opinion that Augustodurus and Bibresata were identical, and D'Anville points out the reason of the supposed difference of the name Beaura from Bibresata.

Upon the downfall of the Roman power, the town was reduced to saxes by Attila, king of the Huns, and other-
A short distance south-east of the town is a singular monument, called Pierre de Coulard. It consists of a solid mass of stone, about ninety feet high, surmounted by a spherical mass, and is about 42 or 43 feet broad at the base on each side, and about 50 feet high, including the base on which it stands. It has the four corners nearly towards the four cardinal points, and a deposit of a solid mass of stone near the base which is very hard white cement. Its origin and use are involved in doubt. Some suppose it is a monument of some illustrious Adonis. It is in the midst of what is called la forêt des orques, a vast forest of strange trees, death-giving evergreens and their funeral urns which have been discovered at different times.

There are the ruins of a theatre, and traces of the seats and arena of an amphitheatre, covered with turf, having around and under the seats small dams, the purpose of which is not clearly known. The forum is also near, and wild beasts employed in the sports of the Amphitheatre. Not far from the Theatre and Amphitheatre, but without the circuit of the antient walls, is the site of the nymphaeum, a large basin or hollow used for exhibiting the representation of a naval engagement, with the remains of an aqueduct for conveying the water to it. There are, also, the ruins of some temples. One of these, that of Janus, on the other side of the Arroux, appears to have been very magn.

In 1756 and 1759, several ancient edifices described by the rhetorician Eumenius (who lived in the third century at Autun), there are no traces now left: such as the temple of Hercules, the palace of the Emperors, and the Menian schools (Schola Meniana or Memiana), a celebrated college of antient Gaul.

A round building, not far from the supposed site of these schools, is regarded as the remains of antient baths. A square tower, called Tour de Minerve (Minerva's Tower), near the gate of the Druids (resembling in some respects the Roman temple of Minerva), already notched by the ancient Celts, is called the Temple of Cybele, is thought to have belonged to a temple of Minerva. Ruins, supposed to be those of a temple of Apollo, stand near the spot, where was the Porte des Marbres, Gate of the Marbles (one of the gates of modern Autun, pulled down in 1777). It was one of the principal gates of a temple of which is termed Le Château, the Castle, and is considered to occupy the site of the antient capitol.

The cathedral, dedicated to St. Lazare, or Lazaurus, is considered to occupy the site of the antient temple. The choir and chancel are very admired, and the spire was considered the finest in Burgundy. The side entrances of modern construction, but in it are preserved four columns, each differently but singularly carved. One represents the centurion, the two on the north half of the door,
points directed upwards, those in the other part downwards.
A second column is adorned with ribands and studs, and a
third by branches of the vine, turning round it in spiral
form, with dependent clusters of grapes. These columns
support two arches adorned with medallions, in which the
signs of the zodiac are represented alternately with the
labours of the year. Nearly all the pilasters in the church
have capitals rudely but singularly adorned. The library of
the chapter contains some curious and interesting MSS.

This church of St. Lazare does not appear to have been
originally the cathedral, but the bishop and his clergy re-
moved to it upon the destruction of the cathedral of St. Na-
zaire, or Nazarius, until that should be rebuilt. That edifice
was, however, never restored, owing to the magnificence
and extent of the plan on which the restoration was com-
menced. The chœur alone was finished, and in this the
bishop entered upon the possession of his see; so that it
was considered to be properly the cathedral. Both these
are in the quarter called Le Château. In front of the
cathedral of St. Lazare is a place or square adorned with
a handsome fountain. The second quarter, called La Ville,
(the city,) contains the principal open space (place), that of
St. Lazare, called by corruption Le Champ de St. Lazare.
It is surrounded by good houses, and being planted with
trees furnishes the citizens with a promenade close at hand.
The third quarter, the Marché, already noticed as the
Marché de Paris of the ancient city, has low ill-built houses
and narrow streets.

There are two bridges over the Arroux; one, the Pont d'Arroux (Bridge of the Arroux, just by the gate of Ar-
roux described above), is built partly on the foundations of
an ancient one, which was a little more to the northward.
The other bridge, that of St. Andoche, is lower down the
stream. Before the Revolution, Autun possessed twelve
religious houses, and, with its suburbs, was divided into
eight parishes. The collegiate church of Notre Dame,
which was founded, or at least rendered collegiate, by the
chancellor Rollin and his wife, in 1644, possesses a painting
on wood by Peter of Bruges, which is much admired by en-
thusiasts. The abbey of St. Martin and St. Jean le Grand,
or John the Great, were of considerable magnificence; and
that of St. Andoche was remarkable for the remains of a
temple of Dana, which served as the kitchen of the estab-
lishment. Two hospitals and two institutions for the
restitution of ecclesiastics (seminaries) are still among the
establishments of Autun, which appears to have owed its
importance very much to its episcopal dignity, and to the
various religious foundations which it contained.

The bishops of Autun held high rank in the church.
They were presidents of the order of the clergy in the states
of Burgundy, and administrators in spiritual and temporal
matters of the archbishopric of Lyon when that see was
vacant. They had jurisdiction over part of the city of Au-
tun. At present the diocese comprehends the department
of Saône et Loire, and the bishop is a suffragan of the Arch
bishop of Lyon and Vienne. Talleyrand was bishop of this
see when the Revolution broke out.

The trade of the town consists in horses, cattle, wool, and
broom. Serge, cotton-velvet, cloth for regimentals, homes
and leather, are among its manufactures. To the east of
the town are several mills. A fabric called tapiserie de
Marché, fitted for coverlets of beds, horse-clothes, and other
purposes, is made in this town. Of this manufacture Autun
was, and perhaps still is, the only seat. The population of
the commune of Autun on the 1st of January, 1832, was
about 10,000, of whom between 3000 and 4000 were in the
town.

There are here three libraries : a collection of portraits,
statues, and medals; an agricultural society; baths, and a
theatre; a tribunal de commerce, or commission for solving
mercantile disputes, and a tribunal de première instance, or
subordinate court of justice, with powers inferior to those
of the court regular, or assizes court.

Among the natives of Autun may be mentioned the pro-
AUVERGNE (Geology of.) A considerable portion of Central France is formed of gneiss, mica-slate, and other of the inferior stratified rocks, associated with granite. Whether any part of the granite has or has not been probed through the gneiss and mica-slate, since their consolidation, is not apparent; but as it seems occasionally to ease into gneiss, which in its turn graduates into mica-slate, we may infer that a part at least of the mass of granite was exhausted in the formation of the mica-slate of the Inferior district. Be this as it may, the beds of gneiss, mica-slate, and others of the same class, are sometimes highly inclined and contorted, as may be observed near Montal, showing that they have been acted on by some powerful force; but as these beds may have been subjected to the action of many powerful forces, during the series of ages which have elapsed since their production, we cannot, without better evidence than we possess, readily fix on the geological epoch when the gneiss and mica-slate were first thrown out of their original positions. As a whole, those rocks constitute a kind of elevated plain, having a mean height, according to Ramond, of about 3290 English feet, and rising, at Pierre-sur-Haute, to an elevation of 3410 feet above the level of the sea.

Above these rocks, which are sometimes termed primitive, or primary, because they are the most ancient with which we are acquainted, we find others that must have been formed at periods separated from each other by considerable intervals of time, since many rocks, necessary to complete the series of European deposits, are wanting between them. Finally, numerous volcanoes, now extinct, poured forth an abundance of igneous products, which, though partially consolidated, have disappeared from the surface of our planet. The rocks which in the order of relative antiquity succeed the inferior stratified and granite rocks above noticed, are referred to in the last section. The rocks which are the same age as the coal measures of Great Britain. Their general mineralogical characters are also similar, beds of coal being associated with shales, sandstone, and conglomerates; the whole appears to be the result of drifted vegetable matter, and of detritus from pre-existing rocks accumulated in unequal quantities and at unequal intervals of time in particular situations. The extent to which these carboniferous rocks once covered the granitic area of Central France is difficult to determine, inasmuch as the gravel changes to which the surface of the country has been exposed; but we may infer, from the general characters of the scattered portions now observed, that the coal measures were once more extensively distributed over Central France than we now find them. The manner in which they were formed is essentially the same as that of the coal beds, though they vary considerably in this respect, sometimes attain twenty or thirty yards in thickness. As the fossil plants discovered in these deposits do not afford any evidence of distant or violent transport, we may infer that the land on which they were once newly occupied by Central France at the epoch of the carboniferous group.

A long interval of time appears to have elapsed, judging at least from the rocks now found in Auvergne, before any other deposits were formed in this part of the European area. During this interval, it is to be supposed, to which it has been exposed, rocks may indeed have been produced, but no traces of such products are now visible, and the evidence is in favor of conditions unsuited to the formation of rocks in this district. It is probable that this may have been one of the epochs of the carboniferous group that to the greater group inclusive. If Central France has been elevated above the general level of the ocean from the time of the coal formation, we might infer from the total absence of rocks with marine remains, conditions would necessarily be unfavorable to the production of any abundant equivalents of those thick and numerous deposits of transported matter which occur in various parts of Europe, which are in the form of terraces, their origin, however, has been formed in a sea. We should, however, expect to discover traces of deposits effected in lakes, by the sides of rivers, and in other situations where transported detritus and calcareous matter precipitated from water could find places of rest. Conditions appear, however, to have been unfavorable for any accumulation of such deposits in sufficient abundance to leave traces of their existence, until the supracretaceous epoch, when large lakes were filled with detritus and calcareous matter.

The supracretaceous lacustrine deposits of Auvergne may, according to M. Crozet (Bulletin de la Soc. Géol. de France, 1833), be divided into three portions:—1. An inferior group of marls and red clays in the district of the former being the lowest. In these are discovered the remains of a quadruped, of a few small reptiles, and the impressions of decytophepous plants. 2. A central accumulation of marls, limestones, and gypseum, in which are found the exuviae of the ophidian Tholus oua, the rasboratherium, a small pachydermatous creature, the crocodile, tortoise, some small reptiles, and of birds analogous to the genus Aves. To which may be added the eggs of birds, and terrestrial depredators, stones and marl, containing an abundance of the Indusia tubulata, Cypria faba, Grygonites, Potamides, Helix, &c. The remains of numerous vertebrated animals are discovered in it; among which there are three species of rhinoceros, two rumina of a species analogous to the genus Novum, and the animals of the genera Canis, Felis, &c. The only portion of this mass of deposited matter of which the relative age has been doubted, consists of certain sandstones, constituting the base of the whole, and termed, according to a French author, a name also given to a rock discovered in a situation intermediate between the lias and the granitic district of Central France, and therefore of much greater antiquity than the lacustrine deposit under consideration. The scarcity of marine remains in the rocks is of little importance, since they are both formed of detrital matter derived from the granitic district itself, and which has afforded similar silt, sand, and gravel, at various geological epochs; so that rocks formed at different periods may be separated from the granitic mass beneath by similar sandstones.

The lakes, for there would appear to have been several, in which this mass of limestone and marl was deposited, must have been deep, since the thickness of the lacustrine formations of Auvergne has been estimated at 800 or 1000 feet in some places. The beds of which it is composed vary from two or three inches to six feet in depth, some of the laminae being exceedingly thin; and the whole, taken generally, presents the appearance of slow and tranquil deposition. As the remains of the mammiferous animals, detected in the upper portion, do not correspond with those discovered in the lower part of these beds, we may infer that a considerable time elapsed prior to the time when the district was affected even during the time that the various deposits were made in the same lakes. Subsequently to the production of the greater proportion of the lacustrine rocks noticed above, the surface of the country was raised, but the volcanic eruptions which occurred were in great abundance. In the Canta, which for the sake of greater clearness we shall consider as part of Auvergne, though geologists have been in the habit of separating them, there is no evidence of terrestrial volcanism, but the portion of the lacustrine rocks was produced after the volcanic eruptions commenced; it is otherwise, however, with the northern part of the district, for the lacustrine deposits of Limagne had not been trenched before the volcanoes burst forth in that direction, as may be seen at the hill of
Georgia, and two or three other places in the vicinity of
Clermont.

The volcanic products are extremely various; some
appearing like the older rocks melted by heat beneath and
thrown up, while others seem to have been derived from
masses which have been extruded on the surface. The two
mountains near Mont-Dore are remarkable for a certain
general resemblance to each other, consisting principally of trachyte
and basalt; the former having been, as a whole, first
thrown up, dislocating the latter. The former is yellowish,
the latter is grey. This observation may be seen in the Cantal
between Auillac and Murat, particularly from the village of
St. Roque to Polminhac. Large fragments of lacustrine
limestone (from 40 to 50 feet in diameter) are included among
the conglomerates. Trachytic rocks of the Cantal have not been produced at
a single eruption, but appear to have been formed at distinct
intervals of time, judging at least from the repetition of the beds.
Dykes of trachyte cut through the principal masses,
as may be observed near Fervel, and near the sources of
the Cer; and it is inferred, that the trachytic eruptions of the
Cantal ceased before the basaltic matter was poured forth,
since the trachytic dykes do not traverse the basalt. The
latter and its conglomerates cover the trachyte in a nearly
continuous mass, broken only by the radiating lines of
valley and the central part of the group, where the inferior
rocks are exposed to view. The Plomb de Cantal, which is
the highest point of the group, and a ridge of an elevation of
6093 English feet above the sea, is formed of a small patch of
basalt. This rock also occurs in dykes traversing the
trachytic masses, sometimes spreading out over their upper
surfaces; the Puys Violent (5323 feet above the sea) is thus
covered with a basalt, which reaches the summit of the
peaks. These dykes of this mountain keep a very constant direction
from S. 10° E. to N. 10° W. Like the trachytic rocks, the basaltic
rocks of the Cantal seem not to have been formed at a single
eruption, but several times, since they constitute several beds. In the
districts of the Puys Violent, and on the flanks of the Valle du
Mar, two beds of basalt are separated by a thick accumulation
of basaltic conglomerate, the lowest bed of basalt resting on trachytic
rubble. M. de Duraffour and Elie de Beaumont (Géographie des
Graves de France, 1833) consider that the cinder-stones at the Puys de
Grieu and adjacent places are more modern than the trachytes
and basalt; and that its eruption forced up these rocks, breaking the whole volcanic group of the Cantal into
those radiating valleys we now see, and which diverge from
the central part of the group onwards.

The Montes-Dore constitute another somewhat circular
system of volcanic mountains, about four leagues in diameter,
and 5000 feet above the sea—the highest elevated point of
Central France. The trachytic rocks are here also the most
antient volcanic products, and occupy the central and
largest part of the group of mountains. Their general mass,
thoough not strictly confined to the outer portions, patches of basalt occurring among the
trachytes of the interior. The whole rests on the granite and
other antient crystalline rocks of Auvergne. The
trachytic conglomerates alternate with solid trachyte, and the latter
is often divided into prisms as beautiful as those of basalt.
The upper bed of trachyte is the thickest, and forms the
rock beneath the greater part of the pastures of Montes-
Dore. Veins of trachyte are well seen in the Vallée du
Enfers. More modern volcanic action can be traced around
the great central mass of these mountains at Monteynard,
and the Puys d'Enfer; and scarce extremely fresh are
observed at the foot of the Val d'Auvern and Auvergne.

The great proportion of the more modern volcanoes of
Auvergne occur in the vicinity of, or at moderate distances
from, the town of Clermont. It would far exceed our
limits to enter into a detail of the volcanoes which are
found in this basin of Auvergne, and some of these have lost
the degrees of interest according to the situations where they
occur, and the rocks with which they are associated.
Though they are, for the most part, distinguished by
cones in different stages of preservative, by lava currents, and by
the presence of cinder, ashes, and lemniscatus in the pre-existing rocks, there are some remarkable for the
absence of cinders and lava currents, and which seem due to a modification of the more usual volcanic action. Of
these, one of the most remarkable is the Puys de Dôme.
formed of a particular kind of rock, which is named domite. This rock varies much in its appearance;
but is generally light grey, and sometimes contains fragments
of granite and of the porphyritic trachyte of the
Montes-Dore (Puys de Dôme, Puys de Barrow).

The Puys d'Enfer may be considered as the chief volcano of
the district; it rises to the height of 3986 feet above the level of the sea; and its truncated cone is a remarkable object, even among the other
volcanic eminences of the country. The crater is beautifully
walled, and measures 933 feet in circumference, and 93 in depth. The upper part of the mountain rises from another crater, from which the upper cone has evidently been
thrown up. The lower crater has been broken down on the side of the Puys de Dôme, to the extent of 400 feet, passing near Orcines, and forming the channel of the lava which rests on the village of Durtol now stands, and stopped at Nobamel.

The other stream, after passing La Baraque, and forming the
channel (as these sheets of lava are termed in Auvergnèse)
of Villars, descended on the granite plateau of the country,
and flowed on to F眉mont, about half a league from
Clermont. The Puys de Laschamps is a more modern
volcano, which attains the greatest elevation above the
sea, its height being 4176 feet above its level. Nothing can be
said of it which has not been already given of other volcanoes now in activity in other countries. Their presence in
Auvergne shows that volcanic action may suddenly commence
in any part of the earth's surface, where no such action had previously been apparent; and that long
centuries may be spent in the quietness of a central vent,
and alternately in the whole physical character of a country, it may cease, for
at least long periods of time, and a district once laid waste by volcanic eruptions be again freed from their ravages.

During the period that these rocks are in a state of activity, conditions would necessarily be favourable
for the production of alluvial deposits, the ashes, cinders,
and ejected stones being readily washed down into the
valleys, where they would be swept onwards by the rivers, and
deposited to the amount of many cubic fathoms. We must
expect to discover some traces of the animals which inhabited the country at this period, and from which we might
obtain an insight into the geological date of some of the eruptions themselves. The remains of antients, so smeared that they must have been entombed in the places where they now occur when the Auvergne volcanoes were in activity, have been found, and from the kind of remains discovered, volcanic eruptions are supposed to have occurred up is a series of three parts of the basaltic crust of the earth, the
lower by M. M. Croiset and Jolbert (Recherches sur les Oeufs. Plut. du
Puys de Dôme), they are, at the Montagne de Perrur (N.W. from Issoire), and in the neighbouring country, about 5000 feet above the sea. These basaltic beds are divided into four alternations of alluvium and basaltic
deposits. Three or four beds contain organic remains. The principal confusion is about ten feet thick, and can be
traced for a considerable distance at the Montagne de
Perrur. The remains discovered consist of—elephant one species; mastodon, one or two; hippopotamus, one;
rhinoceros, one; tapir, one; horse, one; bear, one; feline, four or five; byassa, two; bear, three; canis, one; ruminant one; other, one; hare, one; deer, one; bird, one; others, one or two; mice, one; fowl, one or two; snakes and ox, two. The remains are mixed confusedly with each other, and are of all ages; and mingled with them are the fossil remains of carnivora, appearing to occupy the places where they have been dropped. As moreover, the bones are never rolled, though frequently broken and gnawed, the animals whose remains are thus entombed would appear to have been inhabitants of the immediate
vicinity of the places where their remains are now found.

The waters of Auvergne have sometimes traversed pre-existing valleys, scattering the remains of the
lakes, the waters which accumulated in lakes beyond the barriers of lava. When these lakes became full, the surplus waters discharged over the lava land, and deposited sediment, forming bed-channels for the rivers, and the lakes disappeared. We should anticipate, unless the physical features of a given locality were materially changed during an eruption, that the lowest point of the basin of such lakes would be in the direction of the pre-existing valleys, and at the juncture of
the lava-currents with the opposite sides of such valleys.

This seems to have been the case with the lava-current from the Puys de Cômes (near Clermont), which flowed into the

The vineyard is especially well adapted to the climate and soil of the northern plains of France, where the grapes are large and

AUXERRE, a city in France, capital of the department of Yonne, is situated on the left bank of the Yonne, which gives name to the department. It is 102 miles S.E.

AUXERRE is mentioned in the later periods of the Roman occupation, but under the name of Autissiodorum, Autissiodorium, and Autossiodorum. It was in the

The town suffered considerably in the middle ages from the hostility of the Huns, Normans, Saracens, and English; and from the religious wars of the sixteenth century.

The marshal of Châtillon, who took Créant (a small place near Dreux) from the English, and restored it to the chapter of the cathedral, was received into the house of the eldest son of the family. They entered upon their office dressed in a curious combination of ecclesiastical and military garments.

The arrangement of Auxerre includes a district of 774 square miles or 493,360 acres, and a population of about 12,000 persons. (Maille Brun; Pignol of de la Force; Martinet; Encyclopédie Méthodique; Dictionnaire Universel de la France; M. J. Cobbe; Robertson's History of France.)

AUXILIARY VERBS are distinguished from the following verbs. Verbs express the notions of action: auxiliary verbs, though they originally expressed notions of action, only express relations of action when considered as auxiliary verbs, and are accordingly employed, in connection with other verbs, to give them certain relations called by grammarians tense, mood, and voice. The modern languages of Europe, and our own more particularly, abound in such forms; but it is obvious that the languages of Greece and Rome, sometimes altogether undisguised, more commonly so completely blended with the main verb as to pass for a mere arbitrary suffix, which the grammarians generally call the infinitive. It is in the same way that a particle which plays a secondary part, that it should not occupy too large a share of the attention; and thus those verbs which in course of time are used as auxiliaries, though originally as significant as any other verbs, lose something of their distinctive character; so that if the latter form happen to disappear from a language, the corrupted auxiliary presents anomalies which it is not easy for the philologist to explain. This difficulty is increased by the circumstance, that verbs used as auxiliaries generally throw off much of the distinctive meaning which they originally possessed.

Among the auxiliaries, the most important is the substantive verb signifying to be; and, as might be expected, no word has passed through more variations of form. Grumio and other old ballads, indeed, have latter form that there are three or even more distinct roots combined in the conjugation of this verb. But when allowance is made for the known changes that take place in the letters of the alphabet, there will appear to be a think of the nature of any other verb. Keeping in view the fact that all the varying forms of this verb are derived from a common origin.

As the ultimate form from which all the rest appear to us to have flowed, we will propose the root seet; and every other verb of the same class as having the notion of to be, the root seet. Such a form appears in the Latin esser, pronounced essor, and in the German sein, to be. The initial se, it is well known, sometimes changes in the form of a, and hence the stem of the verb, essen, of the verb to eat. Still more commonly the se is altogether dropped, and then we have the root se, which is the basis of the Greek sub-
The use of the verb to have in the formation of the perfects, so universal in the modern languages derived from Latin, may be occasionally seen in the parent language. Where it occurs, the Latin verbs have, habere, and some others, have undergone great changes, and in the English have, had, had, the Latin consonant has already disappeared. While in the Italian, the Latin habere, we find nothing of the root but the aspirate, even that is often omitted, so that we should hardly recognize habere as the first and second persons plural. But as we shall have further occasion for the forms of this verb in the Roman languages of Europe, we will place here the present tenses. Latin, habeo, habet, habes; habet, habere, habet; habemus, habetis, habent. In the Spanish, he, has, ha; habemos or hemos, habéis, han. French, a, a; a, avons, avez, ont.

that the verbs to have and to wish (lwyn and duov) are often used interjectively. That such, however, is the fact, will not be disputed by those to the medieval language, may consult Anfange-grunde einer Litauischen Sprachlehre, &c., Von C. G. Mielke, Königsberg, 1800.

AUZONNE, or AUSONNE, a fortified town in France, on the left bank of the Saône, and on the road from Paris through the Academy, in Paris, 201 miles from the north of Paris and 18 S.E. of the city. It is in the department of Côtes-d'Or. The foundation of this city is fixed by some about the year 400 of the Christian era, but nothing certain appears to be 2300 years old; the town of Auxonne, in the county of Burgundy, and then was made the capital of the county of Auxonne, which came by exchange into the hands of the dukes of Burgundy, but was not united with their duchy. Upon the seizure of the possessions of the dukes of Burgundy by Louis XI., it fell into the power of that prince. By the treaty of Madrid, it was ceded by Francis I. of France to the emperor Charles V.; but the inhabitants refused to submit to the emperor, and obliged his general, Lannoy, who in 1525, went into the town for four months, to raise the siege. Before the kings of France acquired possession of the Franche Comté, Auxonne was one of the frontier towns of Burgundy, and was defended by a castle flanked by six large towers, erected by Louis XI., Charles VIII., and Louis XII., and manned by a garrison and a small corps of regular troops.

The streets are straight, and the fortifications serve as pleasant promenades. There is a fine bridge over the Saône; and at the end of the bridge, on the side next the town, is a causway of 2326 paces in length (nearly 25 English miles), built in twenty-three weeks for allowing passage to the water in case of inundation. This causway was constructed or improved by Margaret of Bavaria, duchess of Burgundy, in 1495. There are barracks, an arsenal, a school of artillery, a cannon foundry, and porter's mills; also, a library and a high school. There were several religious houses before the Revolution, and a poor and ill-built hospital. The town formerly consisted of two parishes, which are now incorporated into one.

The trade of Auxonne consists chiefly in wine, grain, and wood; as well as cloth and serge, which are sent to Lyons. In return, groceries, silk, and the wines of Mâcon, are received. These wines are sold again in Lorraine and Franche Comté. There are several working goldsmiths in the town.

The number of inhabitants was, in 1821, about 5,000.

There are, in the neighbourhood of Auxonne, quarries of stone of various colours—blue, red, yellow, and purple. Some species of terracotta and fossil corals are found in these quarries. The accuracy of the ground marl, and the abundance of good pasturage. (Encyclopédie Méthodique; Dictionnaire Universel de la France; Dupin; Mariette; Dacier; Audot.)

AUZONNET, ADRIEN, was a native of France, but neither the place nor time of his birth is known. He had established his reputation as an astronomer in 1666, and was one of the original members of the Academy of Sciences, founded in that year. He died in 1690, and was buried in the church of Delambre and others; in 1853, at Rome, according to Montucu, who cites the records of the Academy. The collection hereunder noticed, published in 1693, speaks of him as living (p. 346). Auzeinet is celebrated as having, in conjunction with Picard, discovered the mutual vibration of the moon and earth, and, in 1657, on an admission of Picard to Lahire (Montucu, ii. 543), ascertained by the latter; but there is no mention of it in Picard’s book On the Figure of the Earth. Auzeinet also made an independent invention and application to the telescope of the movable wire micrometer, on which he published a treatise in 1657. Picard assisted him in perfecting this instrument. Heyghens has been frequently stated as an inventor of this micrometer, but his instrument is different in principle, that of Auxineinet is more perfectly described, and is to be found in Picard’s On the Figure of the Earth.

Auzeinet discovered, with just severity, that the invention of the countrymen must needs be original, since the English themselves did not know what Gassouey had done, till Auzeinet communicated his own micrometer to the Royal Society; thus allowing a method of first-rate importance to be discovered by their own national feeling, and not love of science, ramassé their own records.

Auzeinet published observations and calculations of the comet of 1644, and the presentation of his results to Louis XIV., is said to have given that prince the first idea of founding an observatory at Paris. A comparison of the weights and measures of France and other countries, which is to be found, together with his own account of his micrometer, in the folio collection of Memôrers des Huit Académies de Science de France, Paris, 1693. Among other results with the micrometer, he observed and measured the diurnal variation of the moon’s diameter, first explained by Kepler. He was engaged in several discussions with Hooke, which more concern the history of the study of a planet.

Besides the preceding works, we have left of Auzeinet a letter on some new observations of Jupiter and Saturn, Paris, 1664; and a letter to the Abbé Charles on a collection of observations published by Campani, Paris, 1665.

Auzeinet was a good optimian and maker of angles; and when it is added that he never enjoyed even tolerable health, he must be considered as having done not a little for the science.

[See BIRMAN EMPIRE.]

[See BAHRAIN ISLANDS.]

AVALANCHEs are the most dangerous and terrible phenomena to which the valleys and hills of mountain districts are exposed. They are especially frequent in the Alps, owing to the steepness of their declivities, but they are also known in other mountain regions, as in the Pyrenees and in Norway. They originate in the higher region of the mountains, when the accumulation of snow becomes so great that the inclined plane on which the mass rests cannot any longer support it. It then is pushed down the declivity by its own weight, and precipitated into the subjacent valley, where it often destroys forests and villages, buries men and cattle, and sometimes fills up the rivers and stops their course. Besides what is covered with the masses of snow, persons are often killed and houses overthrown by the sudden compression of the air, caused by the incredible velocity with which these enormous masses descend.

Four different kinds of avalanches may be distinguished: drift avalanches, rolling avalanches, sliding avalanches, and glacial or ice avalanches, of which the first commonly take place in the early part of the winter, the second and third at the end of winter and in spring, and the last only in summer.

The drift or slow snow avalanches (called in Switzerland, staub-laissen) take place when heavy snow has fallen in the upper region of the mountains during a still calm, which exposes it to the meridional wind, and which is set in motion by a strong wind. The snow is driven from one declivity to another, and so enormously increased in its progress, that it brings down an incredible volume of loose snow, which often covers greater elevations of a valley. The damage caused by these avalanches is, however, generally not very great, because most of the objects covered by them may be freed from the snow without having sustained great damage; but they often produce such a compression of the air that trees are uprooted, and men and cattle suffocated.

The rolling avalanches are much more dangerous and destructive. These take place when, after a snow, the snow becomes clammy, and the single grains or flakes stick to one another, and so unite into a mass which commonly take the form of balls. Such a ball, moved by its own weight, begins to descend the inclined plane, and all the snow it meets in its course downwards sticks firmly to it. This snow-mass, increasing rapidly in its progress, and descending with great velocity, compresses everything that opposes its course—trees, forests, houses, and rocks. This is the most destructive of the avalanches, and causes great loss of life and property. In the year 1749, the whole village of Turoe in the province of Turin, in the Grisons, was covered, and at the same time removed from its site, by an avalanche of this description; but this change, which happened in the night time, was effected without the least noise, so that the inhabitants were not aware of it, and the town remained uninjured. It is impossible to conceive why it did not grow day. A hundred persons were dug out of the snow, sixty of whom were still alive. The interstices between the snow containing sufficient air to sup-
portun life. In 1894, an avalanche descended into Val Calanca, likewise in the canton of the Grisons, transplanted a forest from one side of the valley to the other on the same range of mountains. In 1892, sixty-four persons were killed in Feltan, in the high valley of Engadin, in the country of the Grisons; and, in the same year, eighty-four persons and four hundred head of cattle, in Oberruggen, and twenty-four of the latter, in both villages, in the canton of Wallis. In the same country, the village of Briol was almost entirely covered by an avalanche in 1827. Many thousands of strong trees are destroyed by these avalanches, either by being broken off by the great masses, or their branches and trunks being broken into the valley. Where these are common occurrence, the inhabitants of the valleys know the places where they come down, and by observing the changes of the weather, they are able to foretell the time of their descent.

The sliding avalanches (rutsch lauiuen, also called snuoggi (pron. sugy)) lauiuen in Switzerland) originate on the lower and less steep declivities, when, after a long thaw in spring, those layers of the snow-covering which are nearest the ground are dissolved into water, and thus the bond is loosened which unites the mass to its base. The whole snow-covering of a declivity then begins to move slowly down the slippery slope, and to carry before it everything which is too weak to withstand the impetus given it by the falling. When an object does not directly impinge upon the mass, it is either borne down by the snow accumulating behind it, or the whole mass divides and proceeds in its course on each side of it.

The ice or glacier avalanches are nothing but pieces of ice, which are broken off from the ice sheet, but, loosened by the summer heat, are detached from the principal mass, and precipitated down with a noise like thunder. They are commonly broken into small pieces by the rocks which they meet in their progress. When seen from a distance, they resemble the cataracts of a powerful stream. In the valley of Grindelwald, in the canton of Bern, they may often be seen; and at the base of the Jungfrau, the thunder which accompanies their fall is almost continually heard. They are not destructive in the same manner as the other avalanches, because they descend only upon places which are not inhabited.

Occasionally the avalanches change their character in their progress. When the declivity is not too great, and the ground under it not too slippery, the mass of snow begins to slide; but arriving at a precipitous descent, its velocity and its mass are greatly increased, and it begins to roll. If, at this stage of its course, it meets a strong, craggy road, it may be less destructive than the other avalanches, and may only break into pieces, and thus it appears at the end of its progress like a drift avalanche.

Avalanche is the common French expression for these natural phenomena, but in those districts of France which are placed on the range of mountains, and other names are: as avalanches, lavanches, lavanges, lavanes, lits, lits, lydts. In Italian they are called lavina and lavine; and in the Rhetic dialect of the Grisons, latina and litza. In German, they are named lasen, laufen, lauten, leuen, lowen, and lienen. In the Pyrenees they are sometimes called congères; and in Norway, snorsh and snosfond. (Kasthofer's Observations on a Journey through the Alps, 4th ed.)

AVALON, a town in France, in the department of Yonne, on the road from Paris to Lyons, 132 miles from Paris to the S.E. It is mentioned in the Itinerary of Antoninus the Itineraries of Aballon, and the attacks made upon it, in the tenth and eleventh centuries, indicate that it was at that period a place of some note. It stands on an eminence composed of coarse red granite, of moderate elevation, on the right bank of the Cousin (called in Brul's Map of France, and in that given in the Encyclopédie méthodique, the Cousin), and has well-built houses, and broad and clean streets. Along the brow of the hill on which the town stands, on the side next the river, is a pleasant walk planted with lime trees. The ascent is at this part very steep and broken, but the descent, after the stream is estimated at 600 feet, so that an extensive prospect is obtained of the district of Morvan, within the boundary of which Avallon is situated. This district of Morvan consists of primitive rocks, and abounds with wood; from it is a considerable part of the supply of the river of the same name, which flows to Paris for Paris is derived. (See MORVAN.)

It is collected at Avallon, and from thence sent in enviro-sungus-built rafts down the Cousin into the Cure, by the Saône into the Seine, and thence to Paris. Cleaned, wooden cloth, and paper are among the manufactures of the town and neighbourhood, and a trade is carried on in wine, wine, cattle, and oil. The inhabitants are above 5000. Avallon is the capital of an arrangeissement or sub-rent, and has a tribunal de commerce, or court of reference for settling commercial disputes, a high-school (collège), and an agricultural society. There are a theatre, public baths, and an hospital. Before the revolution there were four roads from Avallon to Neufchâteau, to Cuny, to Jura, and to the chief village of rail, fertile in corn, and producing vines of good quality. The arrangeissement contains 452 square miles, or 291,840 acres. Its population is about 47,000. (Explain, Dictionnaire Géographique, des pays de la France; Milan, Voyage dans les Départements du Midi de la France; Letters from France, by John M. Cobbett; Mallet Bram.)

AVANTURINE, a variety of quartz, remarkable for the brilliancy with which it reflects light, the effect being in the reflection of the general structure of the crystalline mass. From this circumstance it is sometimes employed in jewelry, but it is of little value.

AVATARA is a Sanskrit word, which properly signifies ‘a descent, or the act of descending.’ e.g. from a beast or other vehicle, is usually applied to the descent of the Hindu deities, or their appearance, in some manifest shape, upon earth. Our information regarding the successive development of religious and mythological ideas among the Hindus is very imperfect. It appears, however, that the doctrine of the Avatars belongs to a comparatively recent period. Those portions of the vedas or sacred writings of the Hindus, to which, from the style and structure of their language, the highest antiquity may with safety be assigned, is differently treated, in the other authorities, of natural power, but do not allude to those apparently more spiritualized deities that require to be invested with a bodily frame to operate in the material world.

The number of the Avatars mentioned in the Puranas, or legendary poems of the Hindus, is very great. Those of Vishnu alone, who is distinguished by the character of 'Preserver' in the Trimurti, or triad of the principal Hindu deities, are stated to be endless. They are variously enumerated; but all accounts agree in selecting the following ten as the most conspicuous:

1. Matsya, the Fish, under which form Vishnu preserved Manu, the ancestor of the present human race, during a universal deluge.

2. Kârûra, the Tortoise, which incarnation Vishnu undertook in order to support Mount Mandara, or rather the entire earth, when the celestial gods and their opponents the Asuras, or Dityas, were chewing the sea for the beverage of immortality, as the gods and demons exchanged blows.

3. Varaha, the Boar. Vishnu, with the head of a monstrous boar, is represented as slaying Hiranyakasîva, the chief of the Asuras, who had taken possession of the celestial regions, and as uplift ing the earth which had been sunk to the bottom of the sea.

4. In his incarnation as Narasimha, a being half man and half lion, Vishnu killed Hiranyakásîva, the brother of Hiranyakasîva.

5. The form of Jlamana, the Dwarf, was assumed by Vishnu to humble the pride of King Bishnu. He was sacrificed because the king was performing, and supplicated for as much ground as he could measure with three steps, which request being granted, the dwarf suddenly grew to an immeasurable size, and with his steps comprised earth, water, and heaven.

6. Vishnu appeared in a human form, as Parasurâma, the son of Jamadagni and Râñukâ, in order to preserve mankind, and especially the Brâhmans, from the tyranny of the military and political power of the Asuras of the days of Duryodhana.

7. Vishnu was born as the son of King Dasaheka, and under the name of Râma, in order to destroy Ravana, the Ditya sovereign of Ceylon, and other demons who were then infesting the earth. The actions of Râma form the subject of a celebrated epic poem in Sanskrit, called the Râmasîma, and attributed to the ancient sage Valînkî.
9. The most celebrated of the Avatāras of Viṣṇu is his appearance in the human form of Kṛṣṇa, in which he is supposed to have been wholly and completely indiscriminate, whereas the other Avatāras are only considered as emanations from his being. Kṛṣṇa assisted the family of the Pāndavas in their war with the Kūraus, and through them relieved the distress of the victims of the wicked man who oppressed them. The history of this conflict is told in the Mahābhārata, another great epic poem in Sanskrit.

10. Ḫudu is, by the followers of the Brahmanical religion, considered as a delusive incarnation of Viṣṇu, assumed by the gods to deceive the Avatāra, to abandon the sacred ordinances of the Vedas, by which they lost their strength and supremacy.

11. Keli is the name of an Avatāra in which Viṣṇu will appear at the end of the Kaliyuga, or present age of the world, to destroy all vices and wickedness, and to restore the world to virtue and purity.

We cannot enumerate the Avatāras of the inferior deities, in which the mythology of the Hindus abounds. We do not remember ever to have heard of any of Brahmā or Śiva, the two supreme deities who, with Viṣṇu, constitute the Trimūrti. In the seventh volume of the Asiatic Researches (Calcuta, 1901) may be seen an account given by Captain Edward Moor of an incarnation of Ganessa, or Ganesa, who, arrived, since the year A.D. 1810, became hereditary in the family of Moonam Contractor, at Moonam, in the province of Punah. The Rev. John Graham (now Mrs. Calcutt), who in 1809 visited this living Avatāra, which was then a child, has given an interesting notice of it in her journal.

3. ABBURY, ABBURY, ABBYR, the name of a village and parish in Huntingdon, England, and at present a name descriptive of the tract of what was once the largest and most interesting Celtic or Druidical temple in Europe. The origin of the name is uncertain: the last part, bury, a borough, or fortified place, and abury, a. round word, and if so, Abbury is not the original name of the place. It is supposed by some scholars that the reader has an account of this great work, as it is presumed to have been in a perfect state; and also with the opinions of some eminent antiquaries respecting its original destination. For this purpose we must refer to the descriptions, drawings, and printed accounts which Dr. Stukeley has left in his interesting work, entitled Abbury, a Temple of the British Druids, fol. 1743. Though the volume bears this date, it appears that the doctor surveyed the place, and made his account of it, as early as 1728, in the vicinity, during the years 1720-24. It is due to that learned and zealous, but rather credulous antiquary to say, that his delineations have every appearance of general accuracy, and that his descriptions are sufficiently permanent.

Before Stukeley's publications, very little was known of Abbury; neither Camden, Leland, nor any other topographer or antiquary seems to have published any account of it. Aubrey, a native of Wiltshire, and an ardent lover of antiquarian subjects, had visited Abbury in 1648. In the year 1643, he was commanded by King Charles II. to write some account of this remarkable monument, the monarch being then on his way to Bath, and having examined the whole in company with Aubrey and Dr. Chariton, who afterwards published An Account of Stonehenge. 'These antiquaries,' says Aubrey in his MS. treatise, 'are so exceedingly old that no books do reach them. I can affirm that I have brought this temple from utter darkness into the light, and am nearer to it than any man that I know before me.' Though Aubrey's account is very imperfect, and was never completed, and though his sketches are even more defective than his descriptions, yet as they are the first record of the place, and contain some useful facts and evidence of the antiquity of it, the difficulties of the seven years before Dr. Stukeley commenced his survey, are valuable and interesting to the antiquary. (See Aubrey.)

The accompanying plans show the general form and arrangement of the stones. When the aborigines of the island fixed on this site for their great temple, we may reasonably conclude that it was in a state of nature, and, like the general character of the Marshborough Downs and Salisbury Plain, was without either trees or underwood of any kind. A thin stratum of mould here covers a continuous chalk substratum, which presents a clean, dry, grassy surface. The immediate approach to the great circular temple is a flat area of ground, having an irregular range of low hills on the east, running north and south, a rising tract of land to the south, a level country of some miles in extent to the north, some undulating and rather high hills to the west, and the coast, with its great river, the Clyde, forming the boundary to the north. Above this, a quiet, called the Kennet, a tributary to the Thames, has its source in a short distance north of the temple. The geological characteristics of the district probably occasioned its being chosen for the erection of a temple which was to be the seat of the edifice of the priests in the island, in which, this might have been regarded as the grand national cathedral, while the smaller circles, in different parts of the island, might be compared to the parish, or village churches. On the surface of the ground, both in the neighbouring valleys and on the high lands, are numerous masses of stone. There is still a great number of detached ovallic sandstones of various sizes, known by the name of the Grey Wethers, lying near the Bath road, in the neighbourhood of Abbury. From among these stones scattered about the neighbourhood, the builders or rather makers of the temple selected such as seemed best adapted to their rude design.

No less than 650 blocks were brought together and placed in circles and rows. These stones were of various dimensions, measuring from five to twenty feet in height above the ground, and from three to twelve feet in width and thickness. One hundred were raised on end, and laid in a circular form, forming a circular area of about fourteen feet in diameter; and these stones were bounded by a deep ditch and lofty wall, which enclosed the whole work, except at two places, where openings were left for entrances to the temple. The bank or mound, with its circumference of 200 feet, seems to have been originally only two openings corresponding to the two great avenues which will be described hereafter. The inner slope of the bank measured eighty feet, and its whole existent, or circumference, at the top, was, according to Stukeley, 600 feet. So that, within the bank or mound is somewhat more than twenty-eight acres. About half way up the inner slope was a sort of terrace walk, apparently adapted for spectators. Dr. Stukeley conjectures that there was a second circular arrangement of upright stones at a short distance within the other circle; and he founds his opinion upon the feet of there being one large stone in a position which does not come into any other component circle of the temple. As the diagram of the temple, showing the arrangement of the stones of No. 3, there were two other small temples within the periphery of the great circle. One was a double circle of upright stones, with a single stone raised near the centre, which Stukeley calls the ambive, or obeleisk; this small temple consists of forty-five stones, as shown in the plan of No. 1 at c. Another temple, of forty-five stones, some of which are still standing and of immense size, was placed a little north of the former, and consisted also of two concentric circles, enclosing a group of three tall stones, called the pase. These were the component parts and the general design and arrangement of the triple temple, as it may be called; but there were two members, or connecting parts, which belonged, and gave a peculiarity to this work, distinguishing it from all other Celtic temples. These were avenues of approach, consisting of double rows, or lines of upright stones, which branched off from the central work, each to the extent of more than a mile. One of them branched off from the outer circle, to the south-west, and was almost squared, the height of the stones varied from fifty to thirty-five feet between the stones, which were, on an average, eighty feet apart from each other in their linear direction. The outer oval of the terminating temple (e) to the south-east, on an eminence called the Hapton, where 500 feet wide, the width of the stone varied from fifty to forty-five feet across. The western avenue (c) extended about one mile and a half, and consisted of 463 stones; its extremity ended, a point, or with a single stone. These avenues, or great approaches to the temple, were not arranged with much height,
but rather in flowing or curved lines, and, according to the theories of Dr. Stukeley and some of his followers, were intended to represent the natural action of a serpent.

Besides the works already described, there are others of very remote antiquity in the immediate vicinity, which, if not integral parts of the temple, were either connected with it, or may be regarded as belonging to the same age and people. These are the numerous barrows, or tumuli, which abound on the neighbouring downs, with the cromlechs and the track-ways. Among the first may be named that large barrow called Silbury Hill, the position of which is shown in diagram No. 2, f, and No. 3, 7. This vast artificial conical mound of earth is regarded as the largest tumulus in Europe, and may be compared to those mentioned by Homer, Herodotus [see Abydos], and other ancient writers. Stukeley, who has given a minute but not very accurate account of it, considers it to be the sepulchral monument of a British king who founded the temple at Avebury. 'I have no scruple to affirm,' he says, 'it is the most magnificent mausoleum in the world, without excepting the Egyptian pyramids.' Though this is a great exaggeration, it is a work which must have cost immense labour. In Sir Richard Hoare's large publication, entitled Antiquities Wiltshire, we are furnished with the survey and calculations of Mr. Edward Crocker, a scientific professional surveyor. The circumference of the hill, as near the base as possible, measures 2927 feet; the diameter, at top, 150 feet, the sloping height 315 feet, and the perpendicular height 170 feet; but that part of our measurement which will excite the most surprise is, that the artificial hill covers the space of five acres and thirty-four perches of land. For what purpose this huge pile of earth was raised, appears to be beyond the reach of conjecture; but 'I think,' says Sir R. Hoare, 'there can be no doubt it was one of the component parts of the grand temple at Avebury, not a sepulchral mound raised over the bones and ashes of a king or arch-druid. Its situation opposite to the temple, and nearly in the centre between the two avenues, seems in some degree to warrant this supposition. Dr. Stukeley (p. 51) observes, 'that the meridian line of the whole work passes from Silbury Hill to the centre of the temple of Avebury,' which observation, making the proper allowance for the variation of the compass, we found very nearly correct in the year 1814. Many other barrows of various dimensions and forms are seen on the downs, some of which Sir Richard Hoare opened in the year 1814. [See Barrow.] A proof that Silbury Hill, and some other barrows near it, were raised before the Roman colonization of Britain, may be found in the fact that the base of the great Roman road from Auge Solis, or Bath, to London, or London, is straight for some miles till it comes to the hill, when it diverges to the south, and again continues in a direct line to Marlborough; in one place the road-makers cut through a large barrow in forming their road.

In the garden of the Castle Inn at Marlborough there is a conical mound of considerable elevation: it is now planted with trees, and a winding path has been made round it, leading to the top. Mr. Bowles remarks that this mound, Silbury Hill, and the mound at Marden form a triangle, which of necessity they must, unless they lie in a straight line.

About one mile north of Avebury are the remains of a large cromlech, with the stones fallen, which Stukeley calls a fast-navy; and at Claverton-brook, about three miles east
of Avebury, is another cromlech, consisting of two standing stones, and one larger raised on them. South of Avebury, about two miles, is a large and long tumulus, which Stukeley called the Arch-Druis's barrow, and which was formerly surrounded by upright stones, and had a kist-van, or a cist over it. There was another tumulus, within a mile of Avebury, were two circles of standing stones, and a single stone standing detached from the circle. At Rockley, and on Temple Down, east of Avebury, were other cromlecha, and works of a similar kind to those already referred to. There is a third British tumulus, in different parts of the downs, all tending to show that this district was, at a remote age, not only a place of permanent residence for a large population, but that it was the chief seat of the religious order of the antient Britons.

The town or village of Avebury now contains a village with its fields, hedge-rows, and buildings, so that it is difficult at present to make out the original design. When Aubrey surveyed the place, in 1648, there were a number of stones than at the time Dr. Stukeley commenced his examination in 1720; and when Sir Richard Hoare and his surveyor made their plan and drawings, in 1812, the stones were still further diminished in number. Even since the latter date, others of the upright stones of Newgrange, in Ireland, is it probable that the remainder will speedily be destroyed and converted into materials for stone fences or roads. Aubrey describes 63 stones as remaining within the entrenchment inclosure in his time, which were reduced to 29 when Stukeley made his plan of the tumulus in 1720, and a small boulder mentioned by Sir Richard Hoare. In the western avenue there are two upright stones left, and about 16 of the southern avenue; but not one remains of the two ovals on Hackpen Hill. An avenue at Avebury was constructed, and the design of it, opinions differ considerably. The most common opinion is that it was raised by a class of the antient inhabitants of Britain called the Druids or Priests, before the Christian era, and was a national temple in which were kept the shrines and images of the antient gods, and that the remainder served the double purpose of religion and judicature. It seems certain that at least it was not intended for defence, because the ditch is within the mound. On these matters we seek in vain for any thing like ancient history or evidence which may at all be considered as disputing antiquity. Nearly all writers on this subject, such as Stukeley, Borlase, Toland, King, Vallancey, Revlins, Davies, Davus, and others, have indulged their fancy in dissertations and speculations on the religion, the manners, and the polity of an antient people, without any data at all. Dr. Stukeley prosecuted his antiquarian studies with intense zeal and considerable learning, but with a disposition to indulge in extravagant speculation; and some of his conclusions are most absurd. This is contending against the same process of study and research. They contend that the Temple at Avebury was raised by the Druids, who worshipped the sun and the moon, and who 'public sacrifices, games, hymns, &c., were periodically performed at 'four seasons or great festivals of the year.' "On no one subject," says the Rev. Mr. Ledwich, in Archaeologia, vol. viii., "has fancy ranged with more licentious indulgence than that of the Druids and their superstitions. Their admirers have represented them as cultivating the abstruse sciences, andPerfecting the sublime mysteries of nature, anticipating the discoveries of Pythagoras, Epicurus, Archimedes, and Newton; and all this without the aid of letters or experiments, without those progressive steps in civil and religious affairs which, in the annals of politics and wars, lead it to the study of abstract knowledge. Such information, or rather such inferences, have been drawn from a few imperfect and incidental notices in the writings of Julius Cæsar, Diodorus, Strabo, Livy, Tacitus, and Pliny. The whole information of all those authors would not amount to three or four pages; yet from such materials some modern English writers have contrived to write many volumes. It is not necessary here to make any remarks on this subject. What is here related by the English writers, Davies, and Deane. The last-mentioned gentleman has lately published a volume "on the worship of the serpent," in which he adopts the theories of Dr. Stukeley, and endeavors to prove that the Temple at Avebury, and some other antient monuments, were in the form of a serpent, and hence may be called draconia, or serpent temples. The 25th volume of the Archaeologia contains his account, with plans and views, of the vast ranges of upright stones at Carnac in Brittany.

For dissertations on Avebury particularly, and other matters connected with Druidical antiquities, &c., the reader is referred to Dr. Stukeley's volume already noticed; to another folio volume, by the same author on Stonehenge; to Sir Richard Hoare's Ancient Monuments of Cornwall, vol. i. 1792; to the Celtic Researches, 8vo., 1804; and his other volume, The Mythology and Rites of the British Druids, 8vo., 1809; Roberts's Sketch of the Early History of the Cymry, or Welsh, 12mo., 1836; and the Book of the Kells, published by the Rev. Mr. Hunter, in 1834. Mallet's Northern Antiquities, 2 vols. 8vo., 1803; and Topland's History of the Druids, 8vo., 1814; Higgins's Celtic Druses, 3d. ed., 1837; Present State of Abbey, by the Rev. J. Hunter, 12mo., 1824; and the Journal of the Society of Druideology, vol. i. 1824.

AVEIRO, a city of Portugal, in the province of Beira, 49° 38' N. lat., 8° 56' W. long. It stands on a gentle elevation, upon the banks of the river Vouga, which flows through the city, and is abundantly supplied with water.

The town is divided into five parts, one of which is surrounded with an antient wall, and the remaining four are the suburbs. At the highest part of the city, on the southern side, is a promenade leading to a convent of the antient order of the Hermits. The suburbs are five small hills, the water of which is employed for domestic uses and for irrigating the gardens. Aveiro is separated from the sea by a bar of sand-hills formed by the tide of the mouth of the river Vouga, which orders the exit of the river in the interior of the bay. The town stands above eight or nine feet of water may conveniently pass. The small gulf opposite the town is covered with little islands on which the inhabitants make great quantities of common salt; this article, with oranges and salt fish, forms their principal branch of export. In these islands they cultivate several species of vegetables for common use. The sea on the coast abounds in delicate fish and sea birds. The lampreys of the Vouga, and the shell-fish of Aveiro are celebrated in Portugal. The town has two parishes, four convents of monks, and three of nuns; its population amounts to 5064 inhabitants.

Aveiro is the capital of the Comarca, or district of that name, which embraces all the territory comprised between the districts of Coimbra and Fous on the south and north, and between Viseu and the ocean on the east and west. The whole district contains a population of 81,570 inhabitants, distributed in several villages, all situated on the banks of the river Vouga and Aveira. The country is generally fertile, and produces grain, wine, oil, and fruit, especially oranges. The territory is low, intersected by many brooks and small channels; and confined on the east side by a high mountain, which is a branch of the Sierra Morena, and renders the whole district barren and subjects its inhabitants to intermittent fevers. (Miñano's Diccionario Geografico; Antillon's Geografia; Castro, Mapa de Portugal antigo e moderno.)

A V E L L I N O, in the province of Naples, near Nola, on the skirts of the plain, and at the foot of the mountains which divide it from the province of Principato Ultra. It commands a fine view as far as Naples, from which it is eighteen miles distant N. E. It gives the title of Prince to a Neapolitan family. Near Avella are the ruins of the antient Abella, celebrated by Virgil (Eneid. vii.) for the abundance of its apples, for which its territory is still famed. The honey gathered in the neighbourhood is also renowned for its flavour. Remains of the old church of San Giovanni, which are still to be seen. The river Clariana, or Laghi, has its source in the mountains near Avella, and after watering the plain of Campania, flows into the sea near the lake Pattiara. N. A V E L L I N O, a consideration of the antient Campania, near Naples, and the capital of the province of Principal Ultra. It is on the high road from Naples to Puglia, 30 miles E. by M. of Naples, in 40° 55' N. lat., and 14° 45' E. long. Avellino is built on the declivity of a hill in the province of Campania. It is one of the chief towns of the Apennine chain, of which the one to the north-west of Avellino divides the valley from the plains of Campania. In this ridge is the strong pass of Monteforte, famous in the annals of that country. The valley of the Sabato is formed by the mountains of Montefusco and Montemilù, which divide the valley of Avellino from that watered by the river Calore, beyond which is the third
or central ridge, on which Ariano stands. [See Ariano.]
The Calore and the Sabato afterwards unite their waters at Benevento, 16 miles N. by W. of Avellino. From Avellino a fine new road leads to Salerno, which is seventeen miles to the south. Avellino was built in the time of the Lombards, it is the neighborhood of Abellinum, which was situated on a mountain about two miles eastward, near the small town of Atipalpa, where many remains of antiquity have been found. Three miles north of Avellino, on a rocky mountain which is celebrated sanctuary of Mary of the Virgin, once a rich Benedictine convent, now suppressed; it was built in the eleventh century, on the ruins of a temple of Cybele. The population of Avellino is reckoned by Balbi at 18,000, which we think too low, it is certainly a much more extensive than 15 years; we believe it must be at least 30,000. Avellino is a bishop's see, and a place of considerable trade in country produce, caste, &c., owing to its favourable central position; there are also several manufacturers of cloth, macaroni, and paper. It has a royal college for the instruction of youth; it also contains the courts of justice for the province of Priziepe, and is the residence of the intendente or governor of the province. It gives the title of prince to a Neapolitan family, the Marquis of Caraccioli, which is possessed of considerable estates in the neighborhood. The eldest son of the Prince of Avellino bears the title of Duke of Atipalpa. The territory of Avellino abounds with fruit trees, especially the apple and the hazelnut. It is much esteemed for the time of the Romans, under the name of nux Avellana.

A V E M A R I A, the two first words of a short Latin prayer or invocation to the Virgin Mary, which is frequently said by Roman Catholics in their orisons. The first part of the prayer is a known one, it is only the second part, or the name of the angel to Mary on her conception. (See Luke's Gospel, i, 26.)

A V E M A R I A, the two first words of a short Latin prayer or invocation to the Virgin Mary, which is frequently said by Roman Catholics in the course of their orisons. The first part of the prayer is a known one, it is only the second part, or the name of the angel to Mary on her conception. (See Luke's Gospel, i, 26.)

A V E M A R I A, the two first words of a short Latin prayer or invocation to the Virgin Mary, which is frequently said by Roman Catholics in their orisons. The first part of the prayer is a known one, it is only the second part, or the name of the angel to Mary on her conception. (See Luke's Gospel, i, 26.)

A V E N A, the botanical name of the genus to which the cultivated oat belongs. As understood by Linnaeus and the writers of his school, it comprehended many very distinct forms of gramin, as well as the common cultivated kinds; but by other botanists it is more correctly limited to the species that yield corn, and to such as are closely related to them. They are known by the term oat; on their two loose membranous glumes, and by the small number of their florets, each of which has one of its beaks or palea armed with a strong twisted beak or awn. The oat is generally, but not uniformly, closely invested with the chaffy outer covering of the bran.

The common oat, Avena sativa, is that which is most generally cultivated for the use of man; like most other corn-plants, its native country is unknown; it cannot, however, be supposed to be the offspring of cultivation or of domestication, but has been known to man for thousands of years. It is cultivated in the northern provinces of Asia, to which the European have little access. For its agricultural varieties and their respective qualities, see OAT.

The Tartar oat is cultivated in a distinct sense, on account of its more compact and one-seeded panicle, and of both its florets having a bearded head; it is, however, doubts, if it can be regarded as anything more than a variety of A. sativa. Botanists call it A. oryzaefusa, but its native country seems to be within the region of China along with some of the rice crops, this species is the most productive of all the oat-grains, which is of a smaller kind than the common oat, its branches are very closely crowded, but the grains, which are large and of excellent quality. It is, however, said to be difficult to harvest on account of the grains not adhering to the husks, but being very easily detached from them. It is probable that the species, which of which is much has been lately said in the English and Irish newspapers, where it is spoken of under the strange name of avernae sativa.

Besides the species cultivated for the corn which they yield, there is another that deserves to be noticed, on account of its remarkable hygroscopic action. This plant, the natural oat of gardeners, the A. sativa of systematic writers, is something like the common oat when young; but when ripe, its grains are inclosed in hard, hairy, brown husks, from the thick of which rises a stout bent and twisted awn; usually two such husks grow together, and separate from the stalk by a deep oblique scar. Taking the head of an insect, the husks with their long stiff brown hairs resemble its body, and the two bent awns represent its legs. Nothing can be more curious than to see the path of a garden-walk covered with these things tumbling and squirming about in different directions, until their awns are so entangled that they can twist no further. They then remain quiet till the dew falls, or they are moistened by a shower, when they may be easily unhooked and run away, as if they were anxious to get out of the way of the wet.

For A. avernae, a grass employed in agriculture, see TURMERIC.

A V E N B R U G G E R, LEOPOLD, a physician of the last century, was born at Graz, in Styria, in the year 1722. He studied medicine and graduated at Vienna, where he practised, and became physician in ordinary to the Spanish nation in the Imperial Hospital of that city. In 1791 he was sent as a medical missionary to the subalpine and northern provinces of Italy, as he was made known to a discovery of an application of the laws of acoustics, or of sounds, to the investigation of the phenomena or action of the internal parts of the human body, particularly the cavities of the chest and abdomen. He translated out of the original into the German was by Rosenh., in 1770, and again by Corvista in 1800, accompa-
into English by Dr. Forbes of Chichester, along with a selection of
Covaris's comments. This translation is called Original Cases, by John Forbes, M.D.,
London, 1724. This method is termed Persuasion.
Avenebruger wrote a work on Madness, in Latin, 1778,
and another work in German, published in 1783; he died
in 1789. These last works are not well known, and
are his first, though announcing a most valuable discovery,
of vast importance in the examination of the various
diseases of the chest and abdomen, attracted little attention till Covaris
translated and published them, and wrote comments and
writings. It is now appreciated as it deserves to be. [See AUSCULTATION.]

AVENS. [See GRUM.]

AVENTINE HILL. [See ROMS.]

AVENTINUS, JOHANN TOLLMAYER, the son
of Johann, was born in Bavaria, in 1478. He studied at Ingolstadt, and afterwards at Paris, where he
The work was first
published in 1514, after the death of the editor, Ziegler, suppressed some passages, which, however, were
restored in the edition of 1560 by Cisneros. Several other editions, which were supposed to be superior to the
first, were published in the 16th and 17th centuries. Gendling, considered the best. It has also been published
in German, but abridged. Avenebruger wrote several
other learned works; among the rest: Numermedi per diges-
tis computari, quod sequentibus extremae consuetudines
Abbas, de, 1542. Some of these works are included in
some tables which he found at Ratisbon representing the
annular masses of the Romans counting on their fingers;
which custom is still continued in Southern Italy. Vita
Hieronymi, et ascendentibus, ab anno 410, 1503.
This work is very rare. Avenebruger died in January, 1534.

AVENZOAR, or AVEN ZOHAR, is the name of two
Arabian physicians, father and son, who flourished in Spain
during the twelfth century. They were Jews by descent and
religion. The first and most celebrated of them was
Abu Marwan Mohammed ben Abdalmelik ben Zohar. According to Ibn Albari, an Arabian author
quoted by Casiri (Biblioth. Ecorc, t. ii. p. 129), he was a
student of among others, Abu Marwan ben Zohar (of Sevilla), and lived as physician at the court of Ibrahim ben
Yousef ben Tashfin, the Almoravid sovereign of Morocco and
Cordova. He died, according to the same authority,
at Sevilla, in the year 627 after the Hegira (a.d. 1227). His
father, Abu Marwan ben Zohar, was also a physician, but
was held in high esteem. The most important of
them is the Tusif, or Introducior; a Latin translation of
which, made from an intermediate Hebrew version, has
been printed recently, and is the first of its kind.

The average is a quantity intermediate to a number of
other quantities, so that the sum total of its excesses above
those which are higher, is equal to the sum total of those
from which are greater. Or, the average is the quantity
which will remain in each of a number of lots, if we take
from one and add to another till all have the same; it
must not be supposed to be the same as the total average,
except what comes from the reduction of others. Thus,
7 is the average of 3, 4, 6, 13, and 14; for the sum of the
excesses of 7 above 3, 4, 6, and 14— that is 9, 5, 7, and 7— is the average of 7 above 3, 4, 6, and 14; for the average of 7 and 6 is 6 1/2.
Similarly, to find the average of any number of quantities, add them all together, and divide by
the number of quantities. Thus, in the preceding question,
add together 3, 4, 6, 13, and 14, which gives 42; divide
by the number of quantities, which gives 8 1/2.
It must be remembered that the average of a set of
averages is not the average of the whole, unless there are equal
numbers of quantities in each set averaged. This will be
seen by taking the average of the whole, without having recourse
to the partial averages. For instance, if 10 men have on the average the 100 lb., and 50 other men have on the average 300 lb., the average sum possessed by each individual is not the average of 100 lb. and 300 lb.; for the 10 men have an average of 150 lb. and the 50 men an average of 150 lb., and 150 lb. is 15,000 lb., being 150,000 lb. in all. This, divided into 60 parts, gives 250 lb., 15 2/3 lb. to each. A neglect of this remark
might lead to erroneous estimates; as, for instance, if a
crane were called good because an average bushel of its
cargo was worth an average dollar, without taking into account the number of bushels of the two.
The average quantity is a valuable common-sense test
of the goodness or badness of any particular lot, but only
estimations of this lake, near the shores of which the Com-
merians, a people who lived in places where the sun never
whose cases resided, according to fabulous tradition. It is likely, however, that when the surrounding banks were thickly covered with forest trees overhanging the river, it may have had a much gloomier appearance than at present; but the trees have been cut down on one side of the river and its banks partially cultivated. The story of the mephitic exhalations which killed the birds that attempted to fly over the surface of the lake (Virgil, b. viii, 5), a phenomenon which gave rise to the Greek name of Aornos, was not true, although evidence of evaporation under the sun has one time have some foundation in truth, as the whole of this region is of volcanic formation, and emits mephitic exhalations; indeed, the lake itself is the crater of an extinct volcano. Hannibale is reported to have gone to Lucernum (xrvii. 155), and Agrippa has paid several visits to Avernus, under the pretext of sacrificing, but in fact with other views. But in the time of Virgil, a communication was opened between Avernus and the neighboring lake Lucernum, which, itself communicating with the sea, was considered by Agrippa in a fine harbor, called Portus Julius. The Lucrine lake was filled up by an eruption which took place in 1538, when a conical mountain rose in its place, which is called Monte Nuovo. Avernus has thus become again a separate lake; and the muddy pool half filled with reeds, and close to the sea-coast, is all that remains of the famous Lucernum. On the southwestern bank of Avernus stands a large and lofty octagonal building of brick, vaulted, and with niches in the walls, supposed by some to have been the Boeotian bath; it is now surrounded by vine trees. Farther to the westward is the entrance to a subterranean passage, called Grotta della Sibilla; it divides into two galleries, one of which opens to the neighboring sea-coast near the pool of Lucerna; the other branches to the right in the direction of Cumna, which place it once reached: Strabo informs us that it was made by Cocceius, under the direction of Agrippa. This last passage has become obstructed by the solidification of the earth. There are several springs in the immediate neighborhood of the lake of Avernus, some of which are used as baths. The most celebrated are the hottest which are close by the sea-shore, and consist of galleries worked through the earth and terminated by a basin or fountain, in which the water strongly impregnated with sulphur, so hot as to boil eggs immersed in it, and the vapoors of which fill up the whole place. Persons resort here for the purpose of taking vapour-baths, the efficacy of which in several complaints has been ascertained. The ruins of Cumna are about one mile west of Avernus. The air of the country about Avernus and the Lucrine pool is wholesome in summer. (See Sirinus, p. 144; and Bai.)

Aervis, a genus of plants belonging to the woodcock tribe (Ornithodoce). It consists of two species, both of which form small trees in the East Indies. They are remarkable for their leaves, which are pinnate, possessing, in a slight degree, the kind of irritability found in the sensitive plant. The pinnules, or leaflets, are covered with a fine, thick, downy, tindal wings. From the other genus of Ornithodoce they are known by this character, independently of all others. In the carambula (A. carambala), the leaves are smooth, the flowers of a violet purple, and the fruit about the size of a goose's egg; it is of a pale yellow colour, and is said to be agreeably acid in the East Indies. It was expected that it would prove worth cultivating in the hothouses for the dessert, but it proves upon trial to be insipid, and far inferior to the European species.

The other species, called the beembling (A. bilimbi), has downy leaves, and fruit resembling a small cucumber. The latter is intensely acid, and cannot be eaten raw. It is pickled or candied, or a syrup is obtained from it by boiling with sugar, and its juice is found an excellent agent for removing iron-moulds or other spots from linen. To the Malays it answers the same purposes as the citron, the gooseberry, the elder, and the cucumber of Europe.

AVERSA, a town in the province of Teramo, in the kingdom of Naples, situated in a fertile plain eight miles N. by W. of Naples, and on the high road to Rome, in 40° 53' N. lat., and 14° 11' E. long. Aversa was built in 1290 by Ralph, a Norman chief, in the country as to the auxiliary of the Lombard princes of Capua and Salerno. The Norman adventurers made it a stronghold, for the purpose of keeping in check their Lombard foes, as well as their Greek enemies. The town was several times restored to the popes by the Norman adventurers from Normandy, attracted by the report of Ralph's success. The emperor Conrad, in 1234, made Ralph count of Aversa and its territory. The country remained in the possession of the Norman kingdom, founded by the offspring of Tancredi of Hauteville, although occasionally injured by foreign invasions and civil war, still maintained its rank as a town of considerable importance. It is now a bustling, lively place, with about

studied Mohammedan jurisprudence under the guidance of his father; theology and philosophy under Eben Sayegh (Aven Paco) and Tofail; and medicine under Avenstror, the father. His diligence was indefatigable; he devoted the greater part of his time to the study of philosophy and medicine, and turned to the perusal of works of history or poetry only by way of recreation. As a Musulman theologian, Averroes adopted the creed of the Asharites, the main principle of which is, that God, being the universal cause of every effect, is not interested, nor can he know one time have some foundation in truth, as the whole of this region is of volcanic formation, and emits mephitic exhalations; indeed, the lake itself is the crater of an extinct volcano. Hannibale is reported to have gone to Lucernum (xrvii. 155), and Agrippa has paid several visits to Avernus, under the pretext of sacrificing, but in fact with other views. But in the time of Virgil, a communication was opened between Avernus and the neighboring lake Lucernum, which, itself communicating with the sea, was considered by Agrippa in a fine harbor, called Portus Julius. The Lucrine lake was filled up by an eruption which took place in 1538, when a conical mountain rose in its place, which is called Monte Nuovo. Avernus has thus become again a separate lake; and the muddy pool half filled with reeds, and close to the sea-coast, is all that remains of the famous Lucernum. On the southwestern bank of Avernus stands a large and lofty octagonal building of brick, vaulted, and with niches in the walls, supposed by some to have been the Boeotian bath; it is now surrounded by vine trees. Farther to the westward is the entrance to a subterranean passage, called Grotta della Sibilla; it divides into two galleries, one of which opens to the neighboring sea-coast near the pool of Lucerna; the other branches to the right in the direction of Cumna, which place it once reached: Strabo informs us that it was made by Cocceius, under the direction of Agrippa. This last passage has become obstructed by the solidification of the earth. There are several springs in the immediate neighborhood of the lake of Avernus, some of which are used as baths. The most celebrated are the hottest which are close by the sea-shore, and consist of galleries worked through the earth and terminated by a basin or fountain, in which the water strongly impregnated with sulphur, so hot as to boil eggs immersed in it, and the vapoors of which fill up the whole place. Persons resort here for the purpose of taking vapour-baths, the efficacy of which in several complaints has been ascertained. The ruins of Cumna are about one mile west of Avernus. The air of the country about Avernus and the Lucrine pool is wholesome in summer. (See Sirinus, p. 144; and Bai.)

Aervis, a genus of plants belonging to the woodcock tribe (Ornithodoce). It consists of two species, both of which form small trees in the East Indies. They are remarkable for their leaves, which are pinnate, possessing, in a slight degree, the kind of irritability found in the sensitive plant. The pinnules, or leaflets, are covered with a fine, thick, downy, tindal wings. From the other genus of Ornithodoce they are known by this character, independently of all others. In the carambula (A. carambola), the leaves are smooth, the flowers of a violet purple, and the fruit about the size of a goose's egg; it is of a pale yellow colour, and is said to be agreeably acid in the East Indies. To the Malays it answers the same purposes as the citron, the gooseberry, the elder, and the cucumber of Europe.
the junction, the stream of the Aveylon turns again to the west, and falls into the Tarn (a feeder of the Garonne), a little above Moissac. The dimensions of this river, as measured on the Map of France published by the Society for the Diffusion of Useful Knowledge, are as follows:—From the source to the junction with the Visat, 17 or 18 miles; from then to the junction of the Visat with the Vézère, 55 miles, making the whole length about 155 miles. The length of the Dordogne is about 20 miles; that of the Alouet about 25 miles; and that of the Visat about 80 miles. The Dictionnaire des Géographes, 8th. &c. of Expilly, gives the length as 36 leagues, which is about 100 miles. But the measurement on the map is in all probability more correct.

The current of the Aveylon is very rapid, and it frequently overflows its banks. The navigation commences at Nogrepelisse, about 20 miles above the place where the river falls into the Tarn. The Roman name of the Aveylon seems to be unknown.

AVEYRON, a department in France taking its name from the river Aveyron, which rises within its boundary, and traverses it in a direction for the most part east and west. The department is bounded on the N. by that of Cantal; on the N.E. by that of Lozère; on the E. by that of Gard; on the S.E. by that of Hérault; on the S.W. by that of Tarn; on the W. by that of Tarn et Garonne; and on the N.W. by that of Lot. It is divided into four arrondissements, namely, the N.E., N.W., S., and S.W. The N.E. and S.W. sides are the longest, each being about seventy-five miles in length: the N.W. side is sixty-three miles, and the S.E. thirty-two; and the area of the department is about 3,400 square miles; it ranks fifth among the departments of France in point of size, and is only about 50 square miles less than the two English counties of Norfolk and Suffolk. The population in 1832 was about 80,000, which gives nearly 100 to the square mile.

The western part of the department is the lowest, and contains some plains of considerable extent. The eastern part is mountainous, being traversed by branches from the chain of La Margeride, which unites the mountains of Auvergne with the Cévennes; the Cévennes themselves form the south-eastern border. From these two ranges of mountains flow the streams which traverse the department, some having their source within the boundary, and others coming from the bordering départements. The Tarn et Garonne, one drawn nearly from N. to S., ninety miles, and the other (drawn from W.N.W. to E.S.E.) eighty-four miles.

The department is about 123 miles N.E. of Paris, on the road to Mons and Brussels. Though the capital of an arrondissement, it is a small town, not having much above 4,000 inhabitants; but it has establishments for refining salt, manufacturing soap, and especially taking tallow on the Tarn, and working it in boors' heads. Before the revolution the church was collegiate, and there were two religious houses, a high-school, and an hospital. Whether the last two establishments still exist, the authorities which we have consulted do not inform us.

The interior of the town is ill-built, and the streets are ill-arranged. The fortifications were repaired and strengthened by Vauban.

Aveyron was founded in the eleventh century. It came into the hands of the kings of Spain of the Austrian family, and was ceded to France by the treaty of the Pyrenees in 1659.

The arrondissement is separated from the rest of the department by the hills which bound the upper part of the basin of the Samue. Many iron works, potteries, and glasshouses are scattered over it. Its population in 1832 was 127,353.

AVEYRON, or AVEIRON, a river in the south of France; it is one of the many whose waters ultimately swell the stream of the Garonne. It rises in the department of Aveyron, in the branches of the Cevennes, near the town of Severac, and flowing towards the west, receives, on the right bank, the little river Serre; after which it continues down the Garonne, and finally falls into the Garonne. Near that town it winds very much. From Rodonz it flows on, still to the westward, without receiving any material accession, until it reaches Villefranche, where it receives another small river on the right bank, the Alouet. Below this town it receives the little stream of the Sorene on the left, and just below on the same side, the larger river, the Visat. This last rises from the same ridge as the Avevron, not far from the springs of the latter, and pursuing, like it, a western course, joins it at the place mentioned above. After
northern, bounded by the Lot, is occupied by the mountains of Languedoc, which have been already mentioned, and which extend more than thirty miles in length. They are subject in winter to heavy falls of snow, which penetrate the ill-built habitations of the country people. The winter is long, and it is not till the beginning of May that the snow begins to melt; but in the mountainous districts they present the most beautiful verdure, and flocks and herds assemble from other parts of the department, where a scarcity of grass is felt. The pastures are divided into 'mountains,' and the extent of these is designated for which reason they are called — as a mountain of thirty or forty cows (montagne de trente, de quarante vaques). From the milk of the cheese of good quality, called Guoille cheese, is made. The cattle are not turned out to pasture during the winter, and are fed on hay, oats, and buck-wheat (sarrasins). September is the month of harvest, but it is often prolonged into October. In summer, the mountains, rising in the form of an amphitheatre one above another, and covered with a rich turf, are a beautiful prospect. The air is unfavourable, except to those who are habituated to it. The valleys contain many villages, and even some small towns (bours). The inhabitants carry on trade in cattle and cheese. Those of the town of Ariège are principally placed in the district, where the surplus of their oaks for the wines of the department of Lot. When wine is dear, they are peaceable and well-behaved; but when the vintage is abundant, quarrels frequently arise, which are so much the more dangerous, as not all the arms are acclimatized to carry a small dagger. Fruit-trees are almost unknown.

These mountains are of volcanic origin; and between Guoille and the village of Naves basaltic columns of various forms are described by the Abbé Dufour in his 'Geologie et Statistique.'

The district bounded by the Lot on the one hand, and the Aveyron on the other, contains the principal mineral wealth of the department. Near Aubin, or Aubin, a small deposit of coal has been worked; and some miles off, near the village of Chaste, the coal is of considerable importance. The coal is used for fuel in the neighbourhood, and supplies many of the forges in the district: a considerable quantity is also sold at the Bozouls. (Encyclopédie Méthodique, Physique et Géographique, vol. 1, p. 72.) The abundance of the mineral, and the ease with which it may be obtained, have led to a very negligent and inartificial manner of working it. Individuals commence mining in the simplest way, and abandon their works when they cease to yield a profit.

In the midst of the coal district of Albin are the mineral waters of Cransane, which are in good repute, and much sought after. These mineral waters, the burning mountain of Fontovioule, and several other forges, were set on fire by some accident, continuing burning. An elliptical opening in the earth, like the crater of a volcano, renders the combustion visible at night to those who can sufficiently brave the heat and smoke to approach it. The plants near the opening are languid and unhealthy. Fire, ochre, pyrites, rock crystal, and marble, are found in the same district. Of the two alum mines in the department, one is at Fontoyne, near Aubin. The produce of these mines is sold to the different forges of Albin and Castel, and in the interior of that of Aveyron. Copra is procured from the alum mine of Fontoyne.

Between the sources of the Aveyron and the Tarn rises the group of mountains of Levezou. The principal range runs from N.E. to S.W. and that the fields become green. One of these branches runs along the left bank of the Aveyron, towards which it has an almost perpendicular descent, and is nearly a desert. On the other side it has a gentle slope, and the bottom of this slope are villages and habitations. The country is fertile, corn and vines are common, and in the Baudot these are succeeded by calcareous strata, which extend to the shore of the Mediterranean. The district of the Levezou is one of the least populous and least civilised districts of the department. The climate is rigorous, and the soil barren. Small widely-spread patches of cultivated land produce oats and rye; but it is said that the farmer degenerates. The pastures are covered with fern, and broom (Rougots and genêts) and prickly shrubs. It is only in the valleys that trees grow: the cattle and sheep are lean and miserable, and the ewes and cows yield little milk, and that little of inferior quality. Their flesh also is poor. In the quality of its vegetation and its animal productions, this district forms the boundary to the district of Aubrac. The snow falls in great quantities, and melts slowly. Sometimes the wind separates the flakes into particles as fine as dust, and it then penetrates by the smallest openings into the houses.

The extremity of the district south of the Tarn, in the neighbourhood of St. Jean de Brueil, the Cevennes mountains yield an abundance of excellent stakes, good plaster or gypsum, and a kind of fullers' earth. A little west of this part, between the rivers Dourbe, Cénon, and Sorgues, rises the elevated plain of Larrac or Larzac, between 2460 and 2500 feet above the level of the sea. It is sustained on the S.E. and S.W. by the Cevennes and the mountains of Caune, and overlooks the valley of the Tarn on the one hand, and the Herault on the other. It is covered with huge square blocks of calcarous strata, which separate at the top, and white and friable at bottom, which some geologists have supposed to be the relics of supercurrent strata. These blocks, which have neither moss nor heath on their surface, present a distance that is almost surpassing imagination. This plain, where the traveller may pursue his way and not meet with a house, or a tree, or a brook, for several miles, furnishes pasturage to vast flocks of sheep. The dryness of the atmosphere, and the aromatic plants which abound, sage, thyme, and juniper, are excellent pastures, with flavour of the mutton fed here, and render the wool superior to that of almost any other department. It is fine and silky, like that of the sheep of the department of Pyrénées-Orientales; but at the same time so greasy as to lose half its weight on a fine day. The finest fleeces are sent to Elbeuf and other manufacturing towns in the northern part of France. The similarity of climate, vegetable productions, and soil, which exists between this district and the northern district of Spain, point out a suitable place for the naturalization of the Spanish sheep.

From the village of Roquefort in this neighbourhood, the Roquefort cheese derives its name. It is made of ewa's milk, and is very delicate; a little goats' milk is added in many places. The quantity of cheese that one cow would alter the quality of the cheese. The cheese of this breed closely resembling the merino. They yield abundance of milk; and it is said that 100,000 of them furnish the supply for making the Roquefort cheese. It is sold in cellars, and when the weather is up it all remains in the large stands, but not dug in. The temperature of these cellars (about 54° or 55° of Fahrenheit) varies little all the year round; and the cheese stored here acquires that peculiar charm which the Celliers recommends. It was in great repute eighty hundred years ago; and is still exported into most countries in Europe. The village has not more than 300 or 400 inhabitants; but they export yearly 15,000 to 18,000 cts. Some cheese, sold under the name of Roquefort, is made at Millau.

Some beds of coal are worked in the district of Larzac.

The atmosphere of the department is generally pure, and the sky clear; but the temperature varies considerably in different parts. The snow remains on the mountain-tops half the year, and the winds are strong, and blow down large trees. The prevalence of the south wind gives to the branches of the trees a general direction towards the north. This wind brings rain, and the dust, to the distant districts of the department; and the west wind does all to the others.

The quantity of waste land is more than one-third of the surface. The principal wealth of the department, as may be inferred from the foregoing account of parturient soils, is in the immense numbers of oil-seeds, mules, oxen, sheep, goats, and swine. The number of sheep was given in the Geographic Universelle of M. Malus Bruni (see last edition, Paris, 1, 12, 13, &c.) at above 600,000, for part to Spain, are reared in considerable numbers. The wealth of the soil is never severe; it is alleviated by alluvial soil; and the grain is raised sufficient for the consumption of the department: wheat, however, is not much
cultivated. Wine, which, for the most part, is of ordinary quality, is made only in the eastern districts. A considerable number of mulberry-trees are grown for the silk-worms. The sides of some of the mountains are covered with vast forests of olive-trees, and sometimes attack the herbs; but the cows instinctively range themselves round the stalls and repel them with their horns sometimes even pursue them. The Dictionnaire Universel de la France (Paris, 1804-5) speaks of iron and copper mines; but Malte E. Esquieu assures us, that with the exception of Bokhara, where the department is still unworked, and he adds that the produce of the coal and alum mines might be vastly increased. Besides the mineral waters of Cnana, already noticed, there are warm baths at Silvan, in the mountainous district, and in the province of Amu-Darja. Their temperature is 40° of Reaumur, or 123° of Fahrenheit.

Silks, woollens (especially serge, linsey-woolsey, and grey cloth), and paper, are manufactured. The streams, especially that of the Tarn, furnish the moving power for the machinery of the factories; and after their navigation commences, they also facilitate the conveyance of goods.

The chief places are as follows: — The capital, Rodz or Rhodze (a name derived from that of the people, the Roteni, who inhabited that country before the Romans), is on the Aveyron, and is a city of about 8000 inhabitants. Milhaou, on the Tarn, has about 10,000 inhabitants in the commune, and nearly 9000 in the town itself. St. Avice, on the Sorgues, has a population of 6300, of whom 4860 are in the town of Villargues. The Villages of the Asson with the Aveyron, has about 9500 inhabitants, of whom above 7000 live in the town itself; and Espallon, on the Lot, has more than 2000 in the town, and 3500 to 4000 in the commune. [See Espallon, Milhaou, Rhodze, and Villargues.] The communes are the smallest municipal divisions; and, for extent, may be compared with our parishes.

St. Avice having been omitted in its proper place, we may add St. Genie d'Olt, or St. Geniez de Rivedoulet, on the right or south bank of the Lot, a neat and small town of 4000 people who manufacture woollen stuffs; it was the native place of the Abbé Raynal. Severac-le-Château is built on a conical hill, of a scanty castle, which has an antiquity of 2000. Entraygues, at the confluence of the Truyère and the Lot, where the navigation of the latter river commences, carries on a considerable timber trade, and was formerly a place of some consequence as a fortress. La Giouile, on the little river Selva, has 3900 inhabitants, who manufacture cloth and worsted stockings. It is on the slope of a basaltic mountain above 3500 feet high. Valres, an insignificant place near St. Avice, was a bishopric up to 1685.

This department constitutes the diocese of Rhodze; the bishop is a suffragan of the archbishop of Alby. It is under the jurisdiction of the curé royal (assize court) of Montpellier, and is in the ninth military division, the head-quarters of the department being at Montpellier. It returns five deputies to the Chamber.

It nearly coincides with the ancient district of Rouergue, a sub-division of the province of Guienne. (Encyclopédie Méthodique, Physique et Morale du Monde, 1812.)

AVICENNA, named ABEN SINA by Hebrew writers, but properly EBN SINA, or, with his complete name, called SHEIKH ABD-RAIYIS ABU ALL AL-HOSSEIN

* These particulars are taken from the Dictionnaire Universel de la France, which was published thirty years ago; and the increased population indicates that the number of cultivated acres has also increased. It was as given above.
and the Ἀνάνια: the titles of many others may be seen in
Casiri (vol. i. p. 270). Among them, the Ἀνάνια acquired
the greatest celebrity, and became, even in Europe, for many
centuries, the standard authority in medical science, less on
account of original merit, in which, according to Sprangel,
it is very deficient, than on account of its judicious arrange-
ment, and the comprehensive view which it afforded of
the doctrines of the antient Greek physicians, at an age when
the knowledge of the Greek language was very scanty. It
was translated into Latin by Gerardus Cremonensis, at
Toldeo. This translation, revised and accompanied with a
commentary, by Jacobus de Paribus, was edited for the
first time in 1498, at Lyons, in four large volumes in folio,
by two German, Johannes Trechsel and Johannes Klein;
several other editions have since appeared, the latest at
Venice, in 1585, fol. An edition of the Arabic text of the
Canon was published at Rome, 1593, fol.

(See Ebh Kathlan, art. al-Hossein ben Sina; Abulharaj,
Historia Dynastiarum, ed. Pocock, p. 329-333; Bar Hebræu,
Chronicon Dynastiarum, t. i. p. 231-233; Casiri, Bibliotheca
Arabico-Hispana, t. i. p. 268, &c.; Hottinger, Bibliothecas
Quadrupartitas, Tigrum, 1644, 4to, p. 258-261; Sprengel,
Histoire de la Médecine, trad. par Jourdan, t. ii. p. 203, &c.
We have not had an opportunity of consulting Vandel’s
translation of an account of Avicenna’s life by Ebh Jolol
Jorjani, Venice, 1593, which is cited by Sprengel.)

AVICULA (zoology), a genus of marine conchifers, or
bivalves with unequal valves, in which Sowerby, with much
show of reason, includes the genus Meleagridina, also formed
by Lamarck. The shell in both is foliaceous externally; and
internally, of a brilliant pearly lustre. The left-hand valve
is contracted and notched posteriorly; and so is the right,
but very slightly. Through this sinus passes the byssus, by
which they are moored to rocks and other marine bodies.
The ligamentary area is marginal and broadest in the centre;
and there is generally a small tooth in each valve near the
umbones. This is most conspicuous, generally speaking,
in Avicula (Lam.), but is not always found, while it is often
present in Lamarck’s Meleagridina, though it is sometimes
absent. The muscular impression is nearly central, some-
what orbicular and large.

Avicula, then, as characterized by Sowerby, will comprise
two sections: the first including those species which have
their base, or hinge-line, considerably prolonged; the
second embracing those which are without that prolonga-
tion—in other words, the Meleagridina. Both sections are
the inhabitants of warm climates. Avicula macroptera may
be taken as an example of the first section.

Avicula macroptera

Avicula marmorifera (Meleagridina marmorifera, Lam.,
Mytilus marmorifera, Linn.), commonly known as the
pearl-oyster, by which name various species are
derived, will afford an illustration of the second section.
The shell itself is imported in great quantities, for the
manufacture of the nacre, or mother-of-pearl, into buttons,
knife-handles, paper-knives, &c.; but its great commercial
value rests on the pearls which it contains. For these beau-
tiful productions, which may be considered as extrava-
стант ilace, there are fisheries in both hemispheres. The pearl
of great price, however, is found in the East, where the
principal fisheries, at Ceylon, Cape Comorin, and in the

Persian Gulf, are carried on by means of divers. Captain
Percival has given so lively an account of the pearl-fishery
at Ceylon, that the whole busy scene is brought before the
reader. (See Pearl.)

AVIÈNUS, or AVIANUS, sometimes written ANIA-
NUS. As it is not within the plan of this work to allot
much space to the discussion of minute and obscure points
of literary history, we shall not inquire which is the true
way of writing the above name, or whether the different
forms belong to one or two persons. Under one or other
of them we have a collection of Æsopian fables in Latin
elegiac verse; translations of the Phenomena and Pro-
nostra of Aratus into hexameters; a translation of the
Periplus of Dionysius, entitled ‘Descriptio Orbis Terræ’;
and a poem in iambic verse, entitled ‘Ora Maritima,’ of
which only the first book remains, containing a description
of the Mediterranean, from the Straits of Gibraltar to Mar-
seilles. The fables commonly bear the name of Plautus Aran
us, the other works that of Rufus Festus Avienus. The reader
will find the identity of these two persons largely disused
in the dissertation annexed to the edition of Aratus’s Fables,
by Henry Canning, Lugd. Bat. 1731: but it requires some
patience to wade through the mass of heterogeneous
matter there collected. The translations from Aratus will be
found in many of the editions of that author, and especially
in that of Bubole, Lips. 1844. The ‘Descriptio
was edited by Frisesmann, Amst. 1786, and, together with
the Ora Maritima, is contained in the Oxford edition of the
Minor Greek Geographers. The author of these works ap-
ppears to have lived about the year 400; Aratus the fab-
ulist is placed, by those who deny his identity with Avienus,
about 240 years earlier.

AVIÈNUS, GENNAADIUS, was a leading senator of
his day (see his character in the Letters of Suidas Apo-
linaria, i. 91) and colleague of Valentinian in his 7th con-
coemate, A.D. 450. Two years after he was sent on the embassay
which induced Attila to pause in his march against Rome
(See Attila; Sirmund, Notes to Suidas, Par. 1852; Gibb.
ch. xxxv.)

AVIGNON, a celebrated city of France, in the depart-
ment of Vaucluse, of which it is the capital. It is estab-
lished on the left bank of the Rhône, just above where the riv-
e Dilongue falls into it; and is 421 miles S.S.E. of Paris, 43° 34′ N. lat., 4° 46″ E. long.

Avignon (the Latin name was Ariminum) is a very
ancient city, and some writers have ascribed its origin to
the people of the Greek colony of Massalia, now Marseille.

The figure represents a young individual. The shell grows to a large
size, and then the defence becomes insensible.
According to another opinion, it was the capital of a Gallic tribe, the Cavares, in whose territory it was doubtless situated, and from which it was called Av-eni Cauvarum. It came into the hands of the Romans at an early period of their dominion in Gaul, and a Roman colony appears to have been established here. Upon the downfall of the Roman empire in the west of Europe it was possessed by the Burgundians, and afforded to the king of that people a secure asylum from the power of Clovis, king of the Franks, who, after he had twice invaded the province twice in succession, at one time as a guest, and at another for perhaps a short time, to the Visigoths, certainly to the Ostrogoths, Franks, and Saracens. The Saracens took it twice, but could not retain it. Afterwards it came into the hands of the Franches, who made it the object of contention between the Counts of Provence and Toulouse, who at last agreed to hold the city conjointly, and to divide its dependencies between them. Part of the dependencies was held by the Counts of Forez and Lavaud; but the last of that family bequested his portion to the citizens of Avignon, who were enabled by this accession to their resources, and by the disensions of the Counts of Provence and Toulouse, to acquire a kind of independence. But when the domains of the two last-mentioned nobles came to an end, the Pope claimed the right of choosing the successors of the Counts of Provence and Toulouse. The Pope intervened in the dispute between the Counts of Provence and Toulouse, and appointed his own nominee as successor. The Counts of Provence and Toulouse were thus deprived of their ancient rights, and the Papal States were thereby established.

The city was a dependency of Provence until the 13th century, when it was granted to the Popes. The city was freed from the jurisdiction of the Counts of Provence and became a dependent of the Pope. It was a center of commerce and culture, and its influence extended far beyond its borders. The city was the center of a rich agricultural region, and its products were in great demand. The city was also a center of religious activity, and many important religious figures lived and worked there. The city was a center of learning, and many famous scholars and artists lived and worked there. The city was a center of political activity, and many important political figures lived and worked there.

The city was the center of many important religious and political events. It was the site of many important religious and political events. The city was the site of many important religious and political events. The city was the site of many important religious and political events. The city was the site of many important religious and political events.

A VI

and that of St. Bernard, the architect of the bridge over the Rhône. The church of the monks of St. Anthony contained the tomb of Alain Chartier, a French writer of eminence in the fourteenth and fifteenth centuries. An ivory cross, 28 inches long, of most exquisite workmanship, a production of the oriental schools, is in the church. This is considered one of the greatest curiosities in the city.

Avignon is still remarkable for the number of its charitable and useful institutions. It has an infirmary for soldiers who are in the forces of the king of France, a lunatic asylum; a high-school (collège royal); a seminary for the education of priests; a society of the friends of the arts; an agricultural society; a collection of paintings and antiquities; a museum of natural history; a library containing 27,000 volumes. There is also a learned society called the Academy of Vaucluse. The present theatre was erected in 1825.

The town is clean: the houses are of stone and well-built; but the streets, in part at least, are narrow and crooked. The town is subject to violent winds. Avignon contains many relics of its former greatness. The papal palace, which is adjacent to the cathedral, is an enormous mass of Gothic architecture, and has been for some time and is still used as a public prison. The fortress now is applied to a similar purpose; it has a fine front.

The trade of Avignon has been making considerable progress for some years past. Silk stuffs are the chief articles manufactured; and there is a cannon foundry; also a flour-mill. The manufacture of leather is now carried on in the city.

The chief productions of the neighbouring country appear to be madder roots and silk. The number of mulberry trees has increased very greatly of late years. A great part of the wine of Avignon is consumed on the spot at the port of Marseilles, and to and from which goods are conveyed on the Rhône by way of Arles. The population of Avignon in 1832, was about 30,000 for the commune, or 26,000 for the town itself. In 1843, Exposit computed them at 32,000. Avignon has 1,350 houses, 250 dwellers who live by themselves in a quarter called the Juiverie, or Jewry.

The bishopric of Avignon is of early date. The town was founded in 1207, by King Saint Louis, son of Simon the Cyprian, who carried our Saviour's cross, the first possession of the pope, and who was acerbon of the plantation of Christianity here to Martha, the sister of Lazarus, and Mary Magdalene. The bishop was successively a suffragan of the Archbishop of Vienne and of Arles; but in 1474 or 1475, Pope Sixtus IV, at the instigation of his nephew, Cardinal Julian de la Rovère, who was then bishop, raised the see to an archbishopric. The suffragans of this new metropolitan were the Bishops of Carpentras, Cavaillon, and Vaison, who were also taken from the see of Arles. The Bishopric of Avignon is now an auxiliary and suffragan to the Bishop of Avignon, the archiepiscopate still retains his rank; and has under him the Bishops of Nimes, Valence, Viviers, and Montpellier. The department of Vaucluse forms his diocese.

Several councils were in the middle ages held at Avignon, but they do not appear to have been general councils. A council of the archbishop and his suffragans was held in 1727. In 1903, Pope Boniface VIII erected a university, but it was not now in existence. It enjoyed considerable reputation in its day.

It may be observed that while the city and territory were subject to the Pope, the river Rhône was always under the dominion of the King of France.

Avignon is remarkable for the variety of its inhabitants and its character. Several illustrious persons, both male and female, were natives of this place; among them Laura, the mistress of Petrarch; the Chevalier Polard, a writer on military affairs; Claude Joseph Vernet, the painter; and the Abbé Poudenas, celebrated puppeteer. The elevation of Avignon comprehends 174 square miles, or 111,340 acres, and contains a population of 66,000 inhabitants. (La Grand Dict. de France, by Abbé Exposit, 1847.)

AVIJA, a district in Old Calabria, containing the territory situated between 40° 15' and 40° 18' N. lat., and 15° 0' and 15° 30' W. long. It is bounded, on the east, by the province of Sepoua; on the west, by that of Salernia; on the south, by the Ionian, and on the north, by Vailo- dolo. The territory of this province is the most elevated in the central part of Spain, particularly in its southern ex-

travesty, where it is very mountainous. The principal of these mountains are the Sierras de Avila, the direction of which is, in general, from east to west. There also is the great Serra de Avila, a truncated cone, the summit of which contains a surface of 3 square leagues, about 78 English square miles. This great mass of ground is almost barren, and serves only for pasture and fire-wood. The southern part of this province being so mountainous is extremely cold, and very thinly peopled. The northern districts are milder, more productive, and better inhabited; the climate is healthier, and the land is more fertile, the produce is in fuel, which is supplied from the forests in the south.

There is a lake, of small extent, near Don Jimeno; and two still smaller lakes, called Los Salmoces, not far from Piren-Banso.

The rivers of this province are very incommodable. The Adaja, which is the principal, has its source near Villatuero, 20 miles west of Avila. Its course is from west to east as far as that city, where it forms an angle, and taking a direct line from south to north, after being enriched by the Balbuna, empties itself into the Duero, in the province of Valledolid. Its course is about 34 miles. The Alberche springs near Piedrahita, on the western boundaries of the province, flows first south, then east, and lastly south-west, and ends near the town of Tagus, in the province of Toledo. Its course through the province of Avila is about 60 miles. The other rivers, or rather streams, are not deserving of mention; with the exception of the last-mentioned, all flow into the Duero, forming the inclination of the land, which in general is to the north.

The area of this province is, according to Miliano, 176 square leagues of 20 to a degree, which makes 1574 geographical square miles; and its population 106,716 inhabitants, distributed as follows: 25,786 through the city of Avila, to which 41,050 dwellers are added; 30,000 are employed on the farm; 15,000 are employed in the manufacture of earthenware and glass; 3,500 are employed on the fields of Tordesillas; 2,500 are employed in the manufacture of leather; 2,500 are employed in the manufacture of wool; and 3,000 are employed in the manufacture of silk.

More than half the lands of the province are uncultivated. The part which is cultivated, and which does not consist of pasture-ground, produces grain, fruit, oil, wine, and flax. The unfruitful state of agriculture in this province was partly owing to the circle of the farthingale, which serves to distinguish the greater part of the lands is either vested inalienably in ecclesiastical bodies or is fettered in the hands of private families by strict entails. (See Miliano, and also the Estadística Territorial de la Provincia de Avila, by Don B. Borgias y Tarrega.)

AVILA, the capital of the province of that name, is situated in a plain elevated 543 feet above the level of the sea, on the right bank of the Adaja, 4° 44' N. lat., 4° 36' W. long. It is surrounded by old walls, which were built in the time of Alfonso VI. of Castile. The streets are very irregular, but well paved and clean. The houses are in general built of granite of a dark colour, which circumstances gives to the city a gloomy aspect. The town is ornamented with many fountains, and the church of St. Mary is in the suburbs. At a certain distance the city presents an appearance of grandeur, owing to the great number of towers and steeples which rise majestically over its old walls.

Avila is an episcopal see, and has a chapter, a bishop, seven dignitaries, twenty young men, and seven women, who are called chaplains. The bishopric contains 628 parishes. The city has eight parishes, eight convents for men and eight for women, an hospital, a seminary, and a university in the convent of Santo Domingo. The population is 4876.

Avila has the privileges called Pola, which are the standard measure for grains, known in Spain by the name of Marco de Avila.

This town has been the theatre of many remarkable events; among others, that of the murder of the weak Enrique IV., who, on the 5th of June, 1449, was solemnly degraded in the public square from the royal dignity, and his brother Alous proclaimed king in his stead. There are at Avila nine manufactories of wool-stuff, five of cotton, and several other manufactures of silk and wool. These manufactories are worked by individuals, besides the royal manufactories of cloth, the machinery of which is moved by water.

Avila is the birth-place of Santo Thomae, the founder of the Carmelites, whose writings are so highly valued in Spain as the purest and most elegant. (See Miliano: Antillen: Estadística de la Provincia de Avila, by Don Bernardo Borgias y Tarrega.)

AVISON, CHARLES, a musician of considerable com-}
under whom he acquired his knowledge of score-writing. He settled at Newcastle-upon-Tyne, having accepted the place of organist of the principal church in that town, where he continued till his death. In 1732 he published his Essay on Musical Expression, a well-written work, which displays much facility, and no small share of that taste which arises out of good sense and deep reflection; but he was not free from prejudices, and laboured in vain to exalt Marcello and Gemmianini at the expense of Handel. Many, however, of his opinions will bear the test of strict examination, and much of what he has advanced, especially in favour of simplicity in choral music, will be admitted to be just, when a little philosophy is called to the aid of musical criticism. His essay was answered by Dr. William Hayes, of Oxford, who distinctly exposed two or three errors which had fallen in expectation, in the rules of musical composition. But the learned professor made his attack with too much asperity, and was, in a few instances, over-strenuous in defending certain laws of harmony which even then were beginning to be slighted, and have since been abrogated in practice. Avison, in the following year, replied to Hayes, in a short pamphlet containing much sarcasm and little argument; and here the matter dropped: but his work continues to be read, while that of his antagonist has been almost forgotten.

The Mayday of the adaptation of Marcello's Psalms to the English version, which Garth of Durham undertook and published, much assisted by the former. His own compositions consist chiefly of five sets of Consorts for a Full Band, forty-five in all, producing every possible production, in which the instrumental parts were nevertheless very favourably received, and one or two of them are still performed at the Antient Concerts, where the distinctness of their melody always secures to them a place among the choirs, among which Avenola, called by the Italians Valona, or La Valona, a town in Albania, on the gulf of Avíona, which is formed by the headland known to the Greeks and Romans as the Aero-Ceranian Promontory, and called at the present day Còrso, Chios, or Sicilia, Cape Tongue, is the termination of the Aero-Ceranian Mountains of the antients, now the Mountains of Khimara. The gulf of Avíona is a deep recess, in proportion to its extent: the town is not at the bottom of it, but on the left hand as you approach it; it was an important place in the time of the French wars, and is now almost entirely colonized by the Albanians.

The long connexion of Avíona with Italy has given it to the appearance of an Italian town. Dr. Holland, on his visit, observed the Italian style of building in the street along which he passed. The population is now, however, almost entirely Mohammedan. Although there is a Greek Bishop of Avíona, yet the number of Greeks is few, perhaps about this 1000. The headland known to the Turks as Lavina, whose superior is the Bishop of Monte Negro. At the time of Dr. Holland's visit (viz. in 1813), and when Mr. Hobhouse was in Albania (in 1809), it supplied Upper Albania with such articles of Italian and German manufacture as are in use among the Albanians; gunpowder, paper, and Calabrian capotes. The exports were timber, gull, nails, wheat, maize, wool, oil, and mineral pitch from the mines of Selenitz, on the left bank of the Vlora, or Bousina, about 8 miles to the N.E. of Avíona. Dr. Holland counted the numbers of the inhabitants near 1000, and Mr. Galt had previously estimated the inhabitants at 5000. There were six mosques and one Greek church.

Avíona was known to the antients in the name of Aulon. It is in lat. 40° 59' N. and long. 18° 29' E. from Greenwich. Avíona was in the pachalie of Berat [see Berat]; and Ibrahim Pacha of Berat, who was deposed and imprisoned by Ali Pacha, retired here after the surrender of his capital, with his treasures and treasures, and held over some of his adherents and retainers until after he had escaped to the mountains, he fell into the hands of his enemies by treachery.

Dr. Holland describes the seed of asphalt or compact asphalt, which is obtained at Selenitz, as a substance extending over a surface at least four miles in circumference. The pitch appears in various places on the declivity of the ravines which intersect the district, and is occasionally worked in such situations, but more frequently by shafts sunk down from the surface. It is covered by a deep mantle of sand, clay, and earth and clay, by beds of shale, and by the thickness of which varies in different places. Dr. Holland described it into one shaft which was only 40 feet deep, 30 feet being cut at the bed of pitch. At this depth, and while having yet a floor of the mineral, the workmen began to tunnel in a horizontal direction: but this mine was of a peculiar origin, as the workings had yet advanced only a few feet from the shaft. The mine, which cuts the bed of pitch (or beds, for it is not ascertain whether it is one continuous bed or not) was 70 or 80 feet thick. The colour of this pitch approaches to black; the smell is strong and unpleasant, and has a specific gravity of 1·4 or 1·5. It becomes viscid, or nearly fluid, when heated, and burns with a tolerably bright flame. The property of the mines is vested in the Grand Seignior, Ali Pacha paid a rent of 10,000 pastures per annum. The value of the pitch is about 100 ducats a barrel, and six or seven cargoes were (about 1812) annually exported, chiefly to Malta and to different Italian ports. Taking the pasture of Selim of 1801 as the standard, 1000 pastures are equal to nearly 6500.

AVOCADO PEAR. [See PERSIA.]

AVOCAT, a French word, derived from the Latin advocatus, and corresponding to the English 'counselor at law.' [See ADVOCATE.] In French law language the avocats, according to the Baron de la Fède, distinguish the Mr. de la Fède, from the barristers, and 'avocats consultants,' called also 'jurisconsultes,' a kind of chamber counsel, who do not plead in court, but give their opinion on intricate points of law. Under the old monarchy the avocats were classed, with regard to their profession, in ten different ranks, into various grades, and divided into chambers, an avocat au conseil, who conducted and pleaded causes brought before the king's council; they were seventy in number, and were appointed by the chancellor; they were considered as attached to the king's council; and 'avocats généraux,' who were pleaded before the parliaments, and other superior courts, in all causes in which the king, the church, communities, and minors were interested. At first the 'avocats généraux' were styled 'avocats du roi,' and the other barristers who pleaded in the councils were called 'avocats de la cour,' but towards the end of the eighteenth century, this division was abolished. Now the avocats are styled 'avocats généraux,' and three or four were appointed to each superior court, while the counsel who filled the same office before the inferior courts assumed the name of 'avocats du roi.' (Repertoire Universel de Jurisprudence, and Dictionnaire de l'Académie.) "Avocat fiscal" was a law-officer in a ducal or other seignorial court of justice, answering to the avocat du roi in a royal court.

At present there are in France 'avocats au conseil du roi,' as formerly; 'avocats généraux,' of whom there are five at the Court of Cassation or Supreme Court, four at the Cour Royale of Paris, besides substitutes, and two or three at each Cour Royal of the Paris, besides substitutes. The avocats généraux, as such, are in the king's council; but the barristers are classed into 'avocats à la Cour de Cassation, who are fifty in number, and who conduct exclusively all causes before that court; and 'avocats à la Cour Royale, who plead before the various Royal courts, and are bachelors at law, and must have taken the oath before the Cour Royale. There is a roll of the advocates practising in each court. Candidates are admitted by the Council of Discipline after a probationary term. The members of the council are elected by the advocates inscribed on the roll. The "avocats" (attorneys) also plead when the number of advocates is not sufficient for the dispatch of business. (Almanach Royal et National.) The word 'avocé,' in canon law, meant the protector or guardian of some church, abbey, monastery, or collegiate church, and the ecclesiastical profession. In the middle ages he was generally some feudal lord who took care of the temporal interests of the community, and defended them either in court or field; he disposed of justice in the name of the ecclesiastical power, in all places under their jurisdiction, and commanded the forces assembled in their defence. In German he was called 'kastrigt;' the name occurs often in the history of the middle ages.

AVERDUPOIS, or AVERDUPOIS, the name given to the common system of weights in England, now applied to all goods except the precious metals and medicines. Thus, a pound of tea is a pound averdupois, and contains 7700 grains; a pound of gold is a pound Troy, and contains 5760 grains. The word has been in use in France for some time as French avoix du poids, to have weight; but considering that averdupois is the more ancient mode of spelling the word, and
that the obsolete French verb aver, and the middle Latin word avera, signify to very (see Dusange. at the word Avera), it is more likely that we are to look here for the true etymology. It has also been supposed that the word is derived from avera pondersa, avera, and avera, being (on the same authority) words used for goods in general.

The ounce averdupe is generally considered as the Roman uncia. It contains 437.5 grains (N.B. there is but one grain in use amongst us), while the Roman uncia, according to Arboeuth, contains 437.5 grains; according to Chevalier, 437.5 grains; and according to Dr. Young) it is 437.5 grains; and according to Pauw, it is 437.5 grains. Whether the preceding correct or not, we cannot suppose that in any case the supposed to be verified. As our inventors do not appear to have been very attentive to small weights: for instance, in the list of church gold and silver plate delivered to Henry VIII. (preserved in the Bodleian library), nothing less than an ounce is mentioned, except only once, in which a quarter of an ounce is given.

The antient pound (now used in Scotland) was heavier than the avedupus, and weighed 7600 grains: the earliest regulations on the subject fix the Troy weight; the avedupus is mentioned in some orders of Henry VIII. A.D. 1532, and a pound of this sort was placed in the Exchequer as a standard by Elizabeth, A.D. 1588. The committee of 1758 found this pound to be 11 grains less than it should be as deduced from the standard troy pound kept at the Mint, which they attributed to frequent use; but considering the avedupus weight altogether as 'of doubtful authority,' and Troy weight as the one 'best known to our law,' they recommended the adoption of the latter as a standard, which it has accomplished ever since, though goods in general are weighed by avedupus weight.

The committee of 1816 made no alteration in the weight, but ascertainment the value of the grain, as afterwards described in the Act of Parliament 5 Geo. IV. c. 74: 'A cubic inch of distilled water, weighed in air by brass weights, at the temperature of sixty-two degrees of Fahrenheit's thermometer, the barometer being at thirty inches, is equal to two hundred and fifty-two grains, and four hundred and fifty-eight thousand two hundred and sixty parts of a grain. The pound avedupus contains 7600 such grains. From this it may be deduced that a cubic foot of water, under the above conditions, weighs 997.14 ounces, which, being very nearly 1000 ounces, gives an expeditious rule for deducing the real weight of a cubic foot of any substance from its specific gravity. For example, if the specific gravity of gold be 19.34, the weight of a cubic foot of gold is 19360 ounces avedupus. If more accuracy be required, subtract three for every thousand from the result.

The avedupus pound is divided as follows:

Grains. Dram.

2714 1 Ounce.

3479 16 1 Pound.

544 16 1 Dram.

8 pounds make one quarter.

11 pounds, or 4 quarters, one hundred weight.

20 hundred weight one ton.

The ounce is more commonly divided into quarters than into drams.

The usual contractions are as follows:

grain . . . dr. . . . oz. . . . hundred weight .

pound . . . dram . . . quarter . . . ounce . .

The phrase a large number of persons often means roughly, from all but two figures take all but three. Then, which they attributed to frequent use; but considering the avedupus weight altogether as 'of doubtful authority,' and Troy weight as the one 'best known to our law,' they recommended the adoption of the latter as a standard, which it has accomplished ever since, though goods in general are weighed by avedupus weight.

Subtract 139

When the number of hundred-weights exceeds 100, the error can never be greater than two.

That is '453.5 of the French kilogramme, and '9071 of the common French pound. That is 904 pounds are 418 kilogrammes, and 412 pounds avedupus are 410 French pounds. [See Weights and Measures.]

If decimals are employed: from a hundredth of the pound, there is a little from the result subtract its hundred weight part. The result is about one five-hundredth part too small. We give the preceding example, and another which is obvious from

17,864 lb. 112 lb.

1765 1 lb.

17 17

159 16 1 lb.

139 16

157 57 998

AVON, the name of several British rivers, the principal of which is below, and which derive their name from the antient British language, and to signify a river.

1. The Upper Avon, or the Avon of Warwickshire, is a tributary of the Severn. It rises from a source called Avon-well, in the village of Naseby, in Northamptonshire; at a short distance from the village of Naseby, in Northamptonshire, the S.W. turns, and forms the boundary between the counties of Northampton and Leicester. About twelve or fifteen miles from its source it is crossed by the Roman Watling-street at Dowbridge, near the remains of a Roman station, supposed by Mr. Ireland to be the Tripontium of Antoninus. This station is in excellent preservation, and is close to the bank of the river. It is not on the Watling-street, but about half a mile from it on the north-east side, and therefore a little higher up the river. From Dow bridge the river has a winding course of about thirty miles—is main direction being first to the west, and then to the south-west, past Rugby, Bretford, Stonelagh, and other places to Warwick. In this part of its course it receives three tributaries, which may be noticed: the Swift, the Lutterworth in Leicestershire, and the Sow (from the north-east part of Warwickshire), fall into it on the right bank, and the Leam or Leases (which comes from the borders of Northampton- shire), the River Leamington, from the left bank. From Warwick, where it flows over a large fall, the river winds gently towards Stratford, the birthplace of Shakespeare, about eight miles south-west from Warwick, by the road; but the length of the river is probably from twelve to fourteen miles. A little below Stratford the river Stour (which rises just within the border of Oxfordshire, and carries off the waters of the southern part of Warwickshire) falls into the Avon on the left bank; a few miles below the Alme (which comes from the north, and receives the waters of the Arrow at Alcester) enters it on the right bank. The stream leaving Warwickshire, enters Worcestershire, and passes on to Eveshaim, having had a course from Stratford of about eighteen miles. From Eveshaim the river takes a circuit by Pershore to Tewkesbury, and the river Severn, which is the north-west part of Gloucestershire, where it falls into the Severn. Thus part of its course may be twenty-five or twenty-six miles; and the whole length of the stream from its rise to its junction with the Severn, may be estimated at about a hundred miles.

The stream of the Avon is gentle, and its banks, interesting and beautiful, though occasionally flat. It is navigable from Stratford for vessels of about forty tons burden. Mr. Ireland states that the authority of a person who occupied the mill near Rugby for almost half a century knows that as soon as the frosts (not in all) the river freezes from the bottom. The freezing commences at the bottom of the flood-gates, which is (the miller) first becomes sensible of by the passage of the water being stopped at the point; and is presently perceived at the flood-gates, in its progress from the bottom to the top, to fill up and subsessively close the crucks that appear in the surface. They attempt to draw the sluices, but in vain, and with no better success attempt, with long poles, to break the ice. These poles, when drawn out of the river, are incrusted with light, hard, and, with the ice. After these frosts the river always overflows its banks. Other masses of ice, in various parts, rise to the surface and are brought down by the stream. The upper part of the river is not frozen; and by the time that it has been four hours above the horizon the whole is desolved, and a mill no longer impeded in its operations. The kind of the miller designated the anchor frost. A similar phaenomenon has been observed in the Thames, and also in America, where the same designation is applied. (Ireland's picturesque views on the Avon.) A canal from Stratford to the Worcester and Birmingham Canal, connects the Avon with the great system of inland navigation in the midland counties.

2. The Lower Avon rises in the hilly district in the

Mr. Ireland, in his picturesque views on the Avon, says. 'Avon, from or Seven, is a name common to rivers whose course is west and east,'
The Kennet and Avon Canal, from Bath to Newbury in Berks, connects this river with the Thames; and other artificial navigations to open water communication between Bath, Bristol, and Newbury, the clothing district of Wilts and Somersetshire. Just below Bristol the fine rocks of St. Vincent rise abruptly close to the river. It was in contemplation some few years since to throw a suspension bridge over the stream at this point, as there would be sufficient head for the navigation between Newport Pagnell and Reading.

Below these rocks the river runs between marshes into the Bristol Channel.

3. The Little Avon is an insignificant stream, which rises in the southern part of Gloucestershire, and flows past Berkeley and into the Severn.

4. The Avon of Wiltshire and Hampshire rises in the former county. It is formed by the junction of several rivulets (rusing in the hills and downs which lie between Hungerford and Devizes), and flows in a southerly direction by Malmesbury towards Salisbury, watering a low valley, considerably below the average level of the country, which intersects Salisbury Plain. At Salisbury it receives the Willy or Willey, or Willeybourne (which comes from the neighbouring and remote village of Overbury in Surrey, or Adder-bourne, from the border of Dorsetshire), and the Bourne which rises to the east of the springs of the Avon, and pursues a course nearly parallel to it. The Bourne, it may be observed, is dry in summer and harvested over, but when the Avon becomes navigable, and entering Hampshire, runs along the western edge of the New Forest, past Fordingbridge, Ringwood, and Christchurch, until it falls into the English Channel.

Near its mouth it receives the Stour, which rising at Stourhead, Wilt., pursues its course in a south-east direction, past Sturminster Newton Castle, Blandford Forum, and Wimborne Minster, into Hampshire, and unites with the Avon. The length of these rivers may be estimated to be as follows: the Avon, from its rise to Salisbury, is about thirty-seven miles long, and its whole length is above seventy miles. The Willey is about twenty-four miles long, and the Nadder about eighteen: the Bourne is nearly as long as the Willey. The Stour is more important, and nearly approaches the Avon itself in length: perhaps its course may be stated at about sixty to sixty-five miles.

Various handsome seats adorn the banks of the Avon on its descent to Salisbury, as well as in the course of its ascent to Salisbury, as well as in the course of its ascent to its source. Below Ringwood, indeed, it passes through a less interesting sandy level to Christchurch. The Stour has a very winding course through a country adorned with a number of beautiful seats.

Large ships can get up to Christchurch, where the tide rises seven or eight feet; but a few miles higher up, locks and sluices are required to make the river navigable.

5. The name Avon is given to two rivers in the principality of Wales. One is in Glamorganshire. It rises in the inland part of the county, and after a south-west course of about fifteen miles, falls into the sea below the village of Aber Avon. The other river rises in Monmouthshire and falls into the Usk near Caerleon. It is of about the same length as the foregoing. This last-mentioned stream is distinguished as the Avon Lwyd, or the Torvdn.

7. 8. 9. Three streams in Scotland bear this name. One is a feeder of the Spey, and rises in the south-western extremity of the county of Banff, close to Cairngorm Mountain. Its source is a small lonely loch, called Loch Avon, with steep precipitous banks, rising sheer up almost to the very ridges of the adjacent mountains, and entirely keeping the sun from the surface of the loch during the winter months. Its course is first easterly for about 13 miles, and then northerly for nearly 20 more, until it joins the Spey at Inveravon. Its whole course is about 32 or 33 miles. It flows from the lake in a large rapid stream; and the water is remarkably transparent, so as to appear formidable where it is not really so. In different books of geography it is said to have a course of only about 20 miles.

The next stream rises just within the border of Ayrshire, and flows in a circuitous course till it falls into the Clyde on the left bank near Hamilton. Its length is nearly 20 miles. The banks are high and bold, and in many places covered with natural wood.

The remaining stream runs from Loch Fanny in Dunbartonshire, and flowing first to the east, and then towards the north, falls into the Forth, a little west of Burrowstone, on the island of Inchcolm. Its course is rather more than 20 miles, but it would be increased in length if measured from the head of one of its tributaries, the Logie water, which has a longer course than the parent stream previous to their junction. For about half its course, the Avon forms the boundary between the shires of Linlithgow and Stirling.

All these Scotch rivers are called sometimes Avons.

(Skrine's English Rivers; Beauties of England and Wales; Camden's Britannia; Ireland's Picturesque Views on the Upper Avon; &c.; Sir T. D. Lauder's Account of the Great Floods of Moray. The lengths are measured on Arrowsmith's Map of England, four sheets, 1813; and Ainlie's Map of Scotland, in nine sheets; except Nos. 2 and 4, and part of No. 1, which have been measured on the Ordnance Survey.)

A VOSSET (Zoology). The vernacular name for some of the genus recurvirostra (Linn.), formerly included among the palmpedes, or true swimmers, but now, with greater attention to the habits and affinities of the birds, placed by Vigors among the grallatores, or waders, in the singularly peculiar sub-family between the genera sisamia (sandpipers) and limosa (godwits), in which last the bill begins to be a little reflected.

[Note: Additional information is provided on the last page for the river Avon in Worcestershire, including its length, source, and the villages it passes through.]
The climate is rigorous, and the soil barren. Small widely-scattered patches of cultivated land produce oats and rye; but it is said that the former degenerates. The pastures are covered with fern, and boom (fougères et genêts), and prickly shrubs. It is only in the valley that trees are found; they are chestnut and oak, and melts slowly. Sometimes the wind separates the flakes into petals as fine as dust, and it then penetrates by the smallest openings into the houses.

The area of the district of Laranca or Largac, between 2400 and 2500 feet above the level of the sea, is surrounded by the mountains of the Auberac, the Cévennes, and the mountains of Caune, and overlooks the valley of the Tarn on the one hand, and that of the Hérault on the other. It is covered with huge square blocks of calcareous rock, and at the top, white and frable at bottom, which some geomorphologists have supposed to be the relics of sedimentary strata. These blocks, which have neither moss nor lichen on them, are the foundations of human habitations. This plain, where the traveller may not meet with a house, or a tree, or a brook, for several miles, furnishes pasture to vast flocks of sheep. The dryness of the atmosphere, and the aromatic plants which abound, sage, lavender, and thyme, impart a peculiar savour of flavour to the mutton fed here, and render the wool superior to that of almost any other district.

From the village of Roquefort in this neighbourhood, the Roquefort cheese derives its name. It is made of ewe's milk, and is very delicate; a little goat's milk is added in many places, but the least quantity of that of the cow would alter the quality of the cheese. The ewes are of a breed closely resembling the merinos. They yield abundant milk, and it is stated that 100,000 of them furnish the supply for making the Roquefort cheese. The cellars, ". . . the houses of the village, hangs in the mountains, and is still exported into most countries in Europe. The village has not more than 300 or 400 inhabitants; but they export yearly 15,000 to 18,000 ewts. Some cheese, sold under the name of Roquefort, is made at Millau.

Some beds of coal are worked in the district of Laranca.

The atmosphere of the department is generally pure, and the sky clear; but the temperature varies considerably in different parts. The snow remains on the mountains half the year. The winds are strong, and unceasing, blowing to unroof the houses and blow down large trees. The prevalence of the south wind gives to the branches of the trees a general direction towards the north. This wind brings rain to the south end of the department; as the west wind does to all the others.

The quantity of waste land is more than one-third of the surface. The principal wealth of the department, as it is inferred from the foregoing account of particular districts, consists in carrying on the breeding of horses, mules, oxen, sheep, goats, and swine. The number of sheep was given in the Geographie Universelle of M. Malte Brun (see last edition, Paris, 1812, et seq.) at above 600,000.
cultivated. Wine, which, for the most part, is of ordinary quality, is made only in the eastern districts. A considerable number of mulberry-trees are grown for the silk-worms. The sides of some of the mountains are covered with vast forests. Wolves sometimes attack the herds; but the cows instinctively range themselves round the stalls and repel them with their horns. Sometimes they eat them. The *Diocesanius Universalis de France* (Paris, 1504-5) speaks of iron and copper mines; but Malte Brun (*Géographie Universelle*) says that the metals of the district are still unworked, and adds that the production of the coal and alum mines might be vastly increased. Besides the mineral waters of Cranée, already noticed, there are warm baths at Silvanèse, in the mountainous district between the Sorgues and the Dourdon. Their temperature is placed under the heat.

Silks, woollens (especially serge, linsey-woolsey, and grey cloth), and paper, are manufactured. The streams, especially the Lot and the Tarn, furnish the moving power for the machinery of the factories, and after their navigation commences, they also facilitate the conveyance of goods.

The chief places are as follows:—The capital, Rodez or Rhôdez (a name derived from that of the people, the Ruteni, who inhabited the country before the Roman conquest), is on the Aveyron, a city of about 6000 inhabitants. Millau, on the Tarn, has about 6000 inhabitants in the commune, and nearly 9000 of them in the town itself.

St. Afrique, on the Sorges, has a population of 6300, of whom 4600 are in the town; Villefranche, at the junction of the Sorgues and the Aveyron, has 2100 inhabitants, of whom 7000 live in the town itself; and Espalion, on the Lot, has more than 2000 in the town, and 3500 in the commune. These are all the seats of sub-prefectures.

St. Afrique having been omitted in its proper place, we shall give a short account of it here. It was, early in the sixteenth century, in the hands of the Calvinists, and was afterwards given up to the Catholics, and a flourishing trade than since. It stood a siege against the royal army in 1528, but was afterwards obliged to submit to Louis XIII, and from that period its decay may be dated. Some cloths and fustian are made here, but the trade of the place is scarcely of any extent; and except its rank as capital of an arrondissement it has few claims to notice.*

The town is surrounded with fine walks, and is situated in the midst of orchards, meadows, and vineyards. The seat of the bishop and the reformed church are the only buildings worthy of notice.

To the towns mentioned above, we may add St. Genièse d'Olly, or St. Genièse de Rivelolt, on the right or south bank of the Aveyron, which was the seat of the abbey of the Abbé Raynal. Sevresac le Château is built on a conical hill, and is commanded by an ancient castle: it has a population of 2900. Espéaux, at the confluence of the Trypère and the Lot, where the navigation of the latter river commences, carries on a considerable timber trade, and was formerly a place of some consequence as a fortress. La Guiole, on the little river Sélve, has 2000 inhabitants, who manufacture cloth and worsted stockings. It is on the slope of a basaltic mountain above 3500 feet high. Valres, an insignificant place very near St. Afrique, was a bishopric up to the time of the French Revolution.

This department constitutes the diocese of Rodez; the bishop is a suffragan of the bishop of Puy. Rodez, on the Aveyron, is the seat of the Jurisdiction of the court royale (assize court) of Montpellier, and is in the ninth military division, the head-quarters of which are at Montpellier. It returns five deputies to the Chamber of Deputies.

It nearly coincides with the ancient district of Rouen, a sub-division of the province of Guienne. (*Encyclopédie méthodique, Géographie Physique, art. Aveyron*; MM. Malte Brun et Balbi, *Dictionnaire Universel de la France.*)

**Ben Abdallah, Ben Sina**, was a celebrated Arabian philosopher and physician, whose name has ruled in the realm of science during a longer period than that of any other writer, with the exception of Aristotle and Galen. He was, according to the biographical dictionary of Ebn Khallikan, born at Kharmatain, a village near Bokhara, in the year 870 and gave evidence of his extraordinary talents at an early age. His father, Al-Mutowe, a famous physician, made him, at the age of thirty, his partner in the practice of medicine. He taught his son the science of Hindu arithmetic (hīdīb al-ḥind) and algebra. About this time Abu Abdallah Al-Nathali, a scholar of some note among his contemporaries, came to Bokhara, and practised medicine there. He was an eloquent speaker, a master of logic, Euclid, and the Almagest. When Al-Nathali left Bokhara, Avicenna, then about sixteen years old, began to turn his attention to the study of medicine, but soon interrupted his medical pursuits to devote another year and a half to a course of philosophical study. In an autobiography memoir of Avicenna, which has been preserved by Abulfaraj, he informs us, that so great was the zeal with which he devoted himself to his studies, that during two years he never went to sleep at night; if he was unable to find the solution of an intricate difficulty, he would not cease repeating his prayers until he had found them; and if he could not overcome the difficulty, he was assured that even before he had reached his eighteenth year, he cured the Samanide Sultan of Bokhara, with a leprosy incurable a. d. 908, and the prince immediately appointed him his physician. This prince was then afflicted with a disease of the kidney. In his twenty-first year he wrote a work which Caesari styles an *Encyclopaedia*, (the Arabic title is *Kitāb al-Majmū‘, i.e. literally 'The book of the sum total.') He subsequently compiled a commentary to it, which extended to twenty-three books. When he was about thirty years old, Avicenna lost his father, whom he succeeded for a short time in the office of minister to the sultan of Bokhara; but after the downfall of the Samanide dynasty, which happened about the beginning of the eleventh century, he quitted Bokhara, and settled at a place close to the river Araz, afterwards to Nisa, Abiwerd, Täs, and other places.

He was for a time attached as physician to the court of the Dilemite sovereign, Shams-ul-Malik Kābūn ben Wasmghr. When this prince was dethroned, which happened about a.d. 1012, Avicenna retired to Jorjan, where he began to write his celebrated treatise on medicine known under the title of the Canon (*Kitāb al-Qānūn fī al-Tibb*, i.e. 'Book of the Canon in Medicine'). He subsequently lived for a time in the city of Kairouan. At that time, after the capture of the city, he was appointed vizir to Shams-eddaullah, the reigning sovereign of that town. In this capacity, however, Avicenna gave but little satisfaction, and lost his office when Shams-eddaullah died. He now took up his abode at Ispahan, where he was occupied several years in the composition of the cases that came under his observation in his medical practice, intending to avail himself of them as materials for the completion of his Canon of Medicine; but we are informed that these notes were lost before he found time to make the intended use of them. He was physician to Alā- eddaullah, then the sovereign of Isphan, and accompanied him on a journey which that prince undertook to Hamadan. Avicenna, whose health had been previously weakened, had an attack of cholera on the road, of which he died shortly after his arrival at Hamadan, being then fifty-eight years old. Ebn Khallikan fixes the time of his death in the month of Ramazan, A. H. 428 (a.d. 1036); the same year is assigned by Abulfaraj (p. 233, ed. Pecock), while Ebn Casiri ('Rihlah', vol. i. p. 299) notices a list of them, in which sixty are enumerated; Ebn Khallikan gives as the number of his works 72, great and short treatises at nearly a hundred, and mentions particularly the *Shefi al-Ibn*, the *Nejati*, the *Ishārāt*, and *Zāyi*.
and the Kândun: the titles of many others may be seen in Casiri (vol. i. p. 270). Among them, the Kândun acquired the greatest celebrity, and became, even in Europe, for many centuries, the standard authority in medical science, less on account of original merit, in which, according to Sprengel, it is very deficient, than on account of its judicious arrangement, and the comprehensive view which it afforded of the doctrines of the ancient Greek physicians, at a time when the knowledge of the Greek language was very scanty. It was translated, revised and accompanied with a commentary, by Jacobus de Partibus, was edited for the first time in 1498, at Lyons, in four large volumes in folio, by two Germans, Johannes Trechsel and Johannes Klein; several other editions have since appeared, the latest at Venice, in 1585, fol. An edition of the Arabic text of the Canon was published at Rome, 1593, fol.

(See Ebn Khalil, art. al-Hossein ben Sina; Abulfaraj, Historia Dynastiarum, ed. Pocock, p. 229-233; Bar Hebræus, Chronicon Dynastiarum, t. i. p. 231-233; Casiri, Bibliotheca Arabico-Hispana, t. i. p. 268, &c.; Hottinger, Bibliotheca Rius Quadruptartis, Tigor, 1654, 4to. p. 236-261; Sprengel, Histoire de la Médecine, trad. par Jourdan, t. ii. p. 363, &c. We have not had an opportunity of consulting Fariella’s translation of an account of Avicenna’s life by Ebn Jolijorjani. Venice, 1595, which is cited by Sprengel.)

AVICULA (zoology), a genus of marine conchifers, or bivalves with unequal valves, in which Sowerby, with much show of reason, includes the genus Melagrina, also formed by Lamarck. The shell in both is fusiform externally; and internally, of a brilliant pearly lustre. The left-hand valve is contracted and notched posteriorly; and so is the right, but very slightly. Through this sinus passes the byssus, by which they are moored to rocks and other marine bodies. The ligamental area is marginal and broadest in the centre; and there is generally a small tooth in each valve near the umbones. This is most conspicuous, generally speaking, in Aricula (Lam.), but is not always found, while it is often present in Lamarck’s Melagrina, though it is sometimes absent. The muscular impression is nearly central, somewhat obovate and large.

Aricula, then, as characterized by Sowerby, will comprise two sections: the first including those species which have their base, or hinge-line, considerably prolonged; the second embracing those which are without that prolongation—in other words, the Melagrinae. Both sections are the inhabitants of warm climates. Aricula macroptera may be taken as an example of the first section.

Aricula margaritifera (Melagrina margaritifera, Lam., Mytilus margaritifera, Linn.) The shell is import in great quantities, for the manufacture of the nacre, or mother-of-pearl, into buttons, knife-handles, paper-knives, &c.; but its great commercial value, other editions have since appeared, the latest at Venice, in 1585, fol. An edition of the Arabic text of the Canon was published at Rome, 1593, fol.

Persian Gulf, are carried on by means of divers. Captain Percival has given so lively an account of the pearl-fishery at Ceylon, that the whole busy scene is brought before the reader. [See PEARL.

AVIENUS, or AVIANUS, sometimes written ANI- NUS. As it is not within the plan of this work to allot much space to the discussion of minutes and obscure points of literary history, we shall not inquire which is the true way of writing the above name, or whether the different forms belong to one or two persons. Under one or other of them we have a collection of Asopian fables in Latin elegiac verse; translations of the Phenomena and Prognostica of Aratus into hexameters; a translation of the Perijesus of Dionysius, entitled ‘Descrip. Orbis Terrae’; and a poem in iambic verse, entitled ‘Ora Maritima,’ of which only the first book remains, containing a description of the Mediterraneum, from the Straits of Gibraltar to Marseilles. The fables commonly bear the name of Flavius Avianus; the other works that of Rufus Festus Avienus. The reader will find the identity of these two persons largely discussed in the dissertation annexed to the edition of Avianus’s Fables, by Henry Cannegeiter, Lrug. Bat. 1731; but it requires some patience to wade through the mass of heterogeneous matter there collected. The translations from Aratus will be found in many of the editions of that author, and especially in that of Bublé, Lips. 1844. The ‘Descripcio’ was edited by Friesemann, Amst. 1786, and, together with the Ora Maritima, is contained in the Oxford edition of the Minor Greek Geographers. The author of these works appears to have lived about the year 400: Avianus the fabulist is placed, by those who deny his identity with Avienus, about 240 years earlier.

AVIENUS, GENNADIUS, was a leading senator of his day (see his character in the Letters of Sidonius Apollinaris, i. 9) and colleague of Valentinian in his 7th consulate, A.D. 456. Two years after he was sent on the embassy which induced Attila to pause in his march against Rome. (See ATTILA; Sirmond, Notes to Sidonius, Par. 1652; Gibbon, ch. xxxv.)

AVIGNON, a celebrated city of France, in the department of Vaucluse, of which it is the capital. It is situated on the left bank of the Rhône, just above where the river Durance flows into it; and is 432 miles S.S.E. of Paris, 43° 56’ N. lat., 4° 46’ E. long.

Avignon (the Latin name was Aréno) is a very ancient city, and some writers have ascribed its origin to the people of the Greek colony of Massalia, now Marseilles.

* The figure represents a young individual. The shell grows to a large size, and then the delicate foliations disappear.
According to another opinion, it was the capital of a Gallic tribe, the Cavesres, in whose territory it was doubtless situated, and from whom it was called Avenio Cavarum. It came into the hands of the Romans at an early period of their dominion in Gaul, and a Roman colony appears to have been established here. Upon the downfall of the Roman empire in the west of Europe it was possessed by the Burgundians, and afforded to the king of that people a secure asylum from the power of Clovis, king of the Franks, who besieged it in vain. It subsequently became subject, perhaps, to the dominion of the Ostrogoths, Franks, and Saracens. The Saracens took it twice, but could not retain it. Afterwards it came into the hands of the kings of Arles and Burgundy. It was an object of contention between the Counts of Provence and Toulouse; the latter being the successor of the ancient county of Toulouse, was entitled to divide its dependencies between them. Part of the dependencies was also held by the Counts of Foresqueur; but the last of that family bequeathed his portion to the citizens of Avignon, who were enabled by this accession to their resources, and by the dissections of the Counts of Provence and Toulouse, to acquire a kind of independence. But when the domains of the two last-mentioned nobles came by marriage into the hands of Charles and Alphonsus, but was called Le Repentigny, Louis XIII., was obliged to submit. It was at first divided between the two princes, but afterwards was wholly included in the county of Provence. The period of independence terminated in 1251, after subsisting less than half a century. A second town was erected, probably for the town to the horrors of war. The crusade against Raymond of Toulouse, chief of the Albigenses, was directed also against Avignon, which supported him. Louis VIII., King of France, besieged and took the city in 1232, beat down the walls and all the houses, cut off the heads of the last part of the citizens to death on pretext of sedition, and would have quite extinguished the liberty of Avignon if death had not removed him.

Nearly half a century after this, Pope Clement V., himself a native of France, removed his court and residence from Rome to Avignon, which continued to be the papal residence, until Gregory XI., in 1376, left it to return to Rome. In the grand schism which took place on the election of the latter pope, the city fell into the hands of the Avignonese, who became the residence of the anti-popes Clement VII., and Benedict XIII. The latter was driven out in 1409 by the French, who were tired of the schism. Pope Clement VI. in the year 1348, during the period of the papal residence at Avignon, caused the city of Angouleme, and its bishopric of the diocese of Angouleme and Queen of Sicily; and the sovereignty was retained by his successors until it was seized by the French, in 1791, since which period Avignon has been a part of France. The popes governed the city and its dependent country, which, for a long time, all but the last, was always non-resident, by a vicar, who had jurisdiction over the county of Avignon, but also over the county Venaissin, which, though frequently confounded with it, was really distinct, and derived its name from the ancient town of Venaissin, in which was situated the see of a bishopric and the capital of the county. (Pignolau la Force, Nouvelle Description de la France, 1722.) The inhabitants of Avignon, however, while they continued subject to the pope, were naturally French, and were eligible to offices or ecclesiastical appointments in that country. A garrison of about 180 men (viz. 50 light horse, who served as the guard of the vicar, 100 infantry, and 20 to 24 Swiss guards, and officers with good pay) was maintained by the papacy.

There were in the city several courts of justice. That of the Vigour was the most ancient. It took cognizance of cases, whether civil or criminal, in which the laity were concerned. There were two judges; but an appeal lay from their court to the Inquisition. This court existed of the Adjutor-General, as president, and four or five other judges. Another court, that of the Adjutor-General, had a primary jurisdiction in particular cases; and was also a court of appeal from the sentence of individual judges or magistrates of Avignon and the county Venaissin. From this court again an appeal might be made nominally to the Vice-Legate, but in reality to the tribunal of the Rote, to which the Vice-Legate transferred the affair; in such cases the Auditor-General took no part in the decision. In criminal cases an appeal lay in the last resort to a tribunal composed of the Auditor-General and some other judges, with the Vicar-Legate himself for president. It seems likely that in this case the papal legation was in form made to the Vice-Legate, and that he committed the case to the tribunal just mentioned. He usually gave audience twice a week to receive appeals. According to an old custom, the right of appeal lay from these several courts to Rome. The Inquisition was also established at Avignon.

The Vigour, who has been already mentioned, though nominally annualy by the Pope, appears to have been the chief of the clergy and the chief magistrate of the city during the period of its independence. He was always a gentleman by station. The police was under the direction of three officers, called Consuls, who, with their assessors, were the police magistrates.

Since the cession of Avignon to France, these various courts have of course given way to the ordinary tribunals of that kingdom.

The city at the most ancient period was built on what was called Le Repentigny, and at first consisted only of a fortress, and gradually extended towards the plain, forming nearly a square. It was surrounded by a strong wall, by whom built is uncertain; but a change in the course of the Rhône having left part of the city open, a new wall was added by the Benefice, a shepherd boy of eighteen, but he did not live to see the completion of the work. It had nineteen arches; and was regarded as a wonderful structure, on account of the breadth, depth, and rapidity of the river. In the year 1669, in the reign of Louis XIV., it was almost entirely taken out of the city, and only four arches were left entire; the part destroyed was replaced by a wooden structure, which appears to be the one now standing.

While under the papal dominion, Avignon abounded in churches and religious establishments. The continual noise of their bells led Rabbiels to give to the city the name of La Ville Sonnante. The cathedral is by no means of uniform architecture. Its portal is supposed to have been removed from an ancient skeleton of the natural site, said to have been seen to one of the sixteenth century. Among the tombs which it contains are those of the Popes Benedict XI. and John XXII. There were appearing in the later period of the papal dominion, collegiate churches served by many ecclesiastics; and a great number of religious houses for persons of both sexes, namely, twenty for men, and fifteen for women; besides hospitals and charitable institutions. The number of ecclesiastics was regulated by Expilly, in 1762, at 900. The church of the Cordeliers was celebrated for the tomb of Laura de Sade. The same tomb contained also the body of her husband Hugues de Sade. Her best monument is the stone church now in ruins, and the tomb has disappeared, but it is said to be still entire under the ground. The site of the church and its enclosure is converted into a fruit-garden, and a small cypress tree marks the spot where the tomb is left. The chapel of the Braving is also in ruins, and the tomb has disappeared.

The site of the church and its enclosure is converted into a fruit-garden, and a small cypress tree marks the spot where the tomb is left. The chapel of the Braving is also in ruins, and the tomb has disappeared. In the church of the Celestines, there was a valuable library, a patrimony.
A V I

was one of the principal cities of France in the fourteenth and fifteenth centuries. Today, however, it is a modest city with little to offer the tourist beyond its historic past.

Avignon was an important city during the Middle Ages, serving as the seat of the papacy for over 180 years. The city is known for its impressive papal palace, the Palais des Papes, which is now a UNESCO World Heritage Site.

The city also has a rich artistic heritage, with many notable works of art on display in the city's museums and galleries. Among the most famous is the famous painting "The Kiss" by Paul Cézanne, which is housed in the Musée Calvet.

Avignon is also known for its annual summer festival, the Avignon Festival, which is one of the largest theatrical festivals in the world. The festival attracts thousands of visitors each year, showcasing a diverse range of performances from around the globe.

In addition to the cultural offerings, Avignon has a lively and bustling atmosphere, with many cafes, restaurants, and shops to explore. The city is also a great base for exploring the surrounding countryside, with its many vineyards and medieval villages.

Overall, Avignon is a wonderful destination for anyone interested in history, art, and theatre, offering a unique blend of past and present.
AVOCA. A French word, derived from the Latin advocatus, and corresponding to the English 'counselor at law.'

AVOCATA. In French law language the avocat is the title of the advocates or counselors at law in our barristers, and avocats consultants, called also 

AVOCAT: a kind of chamber counsel, who do not plead in court, but give their opinion on intricate points of law. Un- 

AVOCADA, called by the Italians Valona, or Va Louna, a town in Albania, on the gulf of Avlona, which is formed by the headland known to the Greeks and Romans as the Acro-Ceramian Promontory, and called at the present day C. Linguetta, or Gela, now a town of the English, is the termination of the Acro-Ceramian Mountains of the antiquity, now the Mountains of Khimara. The gulf of 

AVONNA, called by the Italians Valona, or Valoune, a town in Albania, on the gulf of Avlona, which is formed by the headland known to the Greeks and Romans as the Acro-Ceramian Promontory, and called at the present day C. Linguetta, or Gela, now a town of the English, is the termination of the Acro-Ceramian Mountains of the antiquity, now the Mountains of Khimara. The gulf of Avlona is a deep recess, in proportion to its extent: the town of Avlona stands on a precipitous cliff, and the only way of entrance is by a boat, which for some time before the inferior courts assumed the name of 'avocats du roi.' (Repertorio Universale di Jusprudence, and Dictionnaire de l'Academie.) 'Avocat fiscal' 

was a law-officer in a ducal or other seignorial court of justice, answering to the avocats du roi in a royal court.

At present there are in France 'avocats au conseil ducal,' or former; 'avocats general,' of whom there are five at the Court of Cassation or Supreme Court, four at the Court of Paris, and one at the Court of Rouen. In the departments of France, instead of the old nature of the local counsels, they are called 'avocats a la Cour de Cassation,' who are in number, and who conduct exclusively all causes before that court; and 'avocats a la Cour Royale,' or the lead before the various courts, must be bachelors at law, and must have taken the oath before the Court Royale. There is a roll of the advocates practising in each court. Candidates are admitted by the Council of Discipline after a probationary term. The members of the council are elected by the advocates inscribed on the roll. The 'avocats' (attorneys) also plead when the number of advocates is not sufficient for the dispatch of business. (Almanach Royal of National.) The word 'avoué,' in canon law, means the receiver of a donation or the custodian of a church, monastery, or other ecclesiastical community and jurisdiction. In the middle ages he was generally some feudal lord who took care of the temporal interests of the community, and defended them in court or field; he dis- 

The French word used in English is 'averdupeis.'

AUGUSTUS AVODUROIUS, or AVERDUROIUS, the same given to the common system of weights in England, now applied to all goods except the precious metals and medicines.

The pound of gold is a pound avoirdupois, and contains 1600 grains; a pound of gold is a pound, and contains 5760 grains. The word has been used in the sense of this word, and

which varies in different places. Dr. Holland descended into one shaft which was only 40 feet deep, 30 feet being cut through the bed of pitch. At this depth, and while having yet a floor of the mineral, the workmen began to tunnel in a horizontal direction; but this mine was of irregular origin, and has only advanced only a few feet from the shaft. The miners reported that in the parts the bed of pitch (or bed, for it is not ascertained whether it is one continuous bed or not) was 70 or 80 feet thick. The colour of this pitch approaches to black; the fracture is uneven, and it is also weak and heavy, and has a specific gravity of 1' 4' and 1' 5'. It becomes viscid, or nearly fluid, when heated, and burns with a tolerably bright flame. The property of the mines is vested in the Grand Seignior, and the annual rent is 10,906 piastres per annum. The carriage of the pitch to Avlonna was formerly done by sea, and six or seven cargoes were (about 1819) annually exported, chiefly to Malta, and to different Italian ports. Taking the piastres of Sicilum of 1801 as the standard here, 10,000 piastres are equal to nearly 600l.

AVOCAT. A French word, derived from the Latin advocatus, and corresponding to the English 'counselor at law.'

AVOCATA. In French law language the avocats are the title of the advocates or counselors at law in our barristers, and avocats consultants, called also 'jurisconsultus,' a kind of chamber counsel, who do not plead in court, but give their opinion on intricate points of law. Un-
that the obsolete French verb sveror, and the middle Latin word avertere, signify to every (see Ducange, at the word averti), it is more likely that we are to look here for the true etymology. It has also been supposed that the word is derived from averet via ponderis, averet, and averet, being (on the same authority) words used for goods in general.

The ounce averdupois is generally considered as the Roman unia. It contains 4374 grains (N.B. there is but one grain in use amongst us), while the Roman unia, according to Archibald, contains 4374 grains; according to Coddington, 50 on the old coin of Venice, 1768. Cited by Dr. Younq) it is 4374 grains; according to Plautus (called by Dr. Kelly) it is 4374 grains. Whether the preceding be correct or not, we cannot suppose that in any case the supposition be verified, nor do our ancestors do not appear to have been very attentive to small weights: for instance, in the list of church gold and silver plate delivered to Henry VIII. (preserved in the Bodleian library), nothing less than an ounce is mentioned, except only once, in which a quarter of an ounce is given.

The antient pound (now used in Scotland) was heavier than the avoirdupois, and weighed 7680 grains: the earliest regulations on the subject fix the Troy weight; the avoirdupois is mentioned in some orders of Henry VIII. A.D. 1532, and a pound of this sort was placed in the Exchequer as a standard by Elizabeth, A.D. 1588. The committee of 1738 found this pound to be 11 grains less than it should be as deduced from the standard Troy pound kept at the Mint, which they attributed to frequent use; but considering the avoirdupois weight altogether as 'of doubtful authority,' and Troy weight as the one 'best known to our law,' they recommended the adoption of the latter as a standard, which is done, except in money ever since, though goods in general are weighed by Troy weights.

The committee of 1816 made no alteration in the weights, but ascertained the value of the grain, as afterwards described in the Act of Parliament 3 Geo. IV. c. 74: 'A cubic inch of distilled water, weighed in air by brass weights, at the temperature of sixty-two degrees of Fahrenheit's thermometer, the barometer being at thirty inches, is equal to two hundred and fifty-two grains, and four hundred and fifty-eight thousandth parts of a grain. The pound avoirdupois contains 7680 such grains. From this it may be deduced that a cubic foot of water, under the above conditions, weighs 99714 ounces, which, being very nearly 1000 ounces, gives an expedient rule for deducing the real weight of a cubic foot of any substance from its specific gravity. For example, if the specific gravity of gold be 19.36, the weight of a cubic foot of gold is 19360 ounces avoirdupois. If more accuracy be required, subtract three for every thousand from the result.

The avoirdupois pound is divided as follows:

<table>
<thead>
<tr>
<th>Grains</th>
<th>Drams</th>
</tr>
</thead>
<tbody>
<tr>
<td>2711</td>
<td>1</td>
</tr>
<tr>
<td>4374</td>
<td>16</td>
</tr>
<tr>
<td>5648</td>
<td>1</td>
</tr>
</tbody>
</table>

28 pounds make one quarter.

112 pounds, or 4 quarters, one hundred weight.

20 hundred weight one ton.

The ounce is more commonly divided into quarters than into drams.

The usual contractions are as follows:

<table>
<thead>
<tr>
<th>grain</th>
<th>dr.</th>
<th>o.</th>
<th>pound</th>
</tr>
</thead>
<tbody>
<tr>
<td>576</td>
<td>16</td>
<td>1</td>
<td></td>
</tr>
</tbody>
</table>

There is a large number of words in weights, roughly, from all but two figures take all but three. Thus 17,834 pounds contain 159 hundred weights, done as follows:

Subtract 139

When the number of hundred-weights exceeds 100, the error can never be greater than two.

Avoirdupois is 4811 of the French kilogramme, and 9071 of the common French pound. That is, 904 pounds are 481 kilogrammes, and 452 pounds avoirdupois are 419 French pounds. [See Wrights and Measurements]

If decimals be employed: from one hundredth of the pounds is subtracted a hundredth of the quarter, a hundredth of the ounce, a hundredth of the drachm, or a hundredth of the grain.
ern part of Wiltshire. Several springs, after uniting their waters, flow first to the N.W. past Wootton Bassett (but not close to the town), then turn to the W., and afterwards to the S.W., past Chippenham and Melksham to Bradford, nearly forty miles from the source, following the windings of the river, which is not navigable. The river Avon receives a stream from the neighbourhood of Malmesbury, which is marked in some maps as the Avon, as though it were the main stream; and another small stream of the same name, which joins the river above Chippenham. From Bradford the river has a circuitous course of more than ten miles to Bath, receiving the little stream of the Were from Trowbridge, and the Frome from Frome, both on the left bank. Between Bradford and Bath it is sometimes navigable, and from Bath to Bristol, which becomes navigable, flows about twenty-seven or twenty-eight miles to the N.W. through Bristol into the Bristol Channel. Its whole course is thus between seventy and eighty miles. Large vessels can get up to Bristol, which is nine or ten miles up the river.

This river is more remarkable,' says Skrine (General Account of all the Rivers of Note in Great Britain), 'for the romantic valleys it forms, and the rich country it winds through. It is navigable for its entire course, being generally buried between deep banks. Its colour also is liable to be affected by storms—those from Wiltshire tingling it with white from a chalky soil, and those from Somersetshire with red from the ochre prevailing in that country; but it naturally presents a dark tawny appearance, except where shallows intervene, and is occasionally rapid.

The Kennet and Avon Canal, from Bath to Newbury in Berks, connects this river with the Thames; and other smaller navigations connect the streams of Wilts and Berks, between Bath and Bristol, and the clothing district of Wiltshire and Somersetshire. Just below Bristol the fine rocks of St. Vincent rise abruptly close to the river. It was in contemplation some few years since to throw a suspension bridge over the stream in this point, as there would be sufficient height for the largest vessels to pass beneath it. Below these rocks the river runs between marshes into the Bristol Channel.

3. The Little Avon is an insignificant stream, which rises in the northern part of Gloucestershire, and flows past Berkeley castle into the Severn.

4. The Avon of Wiltshire and Hampshire rises in the former county. It is formed by the junction of several rivulets (rising in the hills and downs which lie between Ilmington and Devizes) and flows in a southerly direction by Amesbury towards Salisbury, watering a low valley, considerably below the average level of the county, which intersects Salisbury Plain. At Salisbury it receives the Wilt or Wilton, which comes from the neighbourhood of Warminster, and is augmented by the Nadder, or Adderbourne*, from the border of Dorsetshire, and the Bourne which rises to the south of the springs of the Avon, and pursues a course nearly parallel to it. This river, and all others tributary, are navigable at low water. By these affluents the Avon becomes navigable, and entering Hampshire, runs along the western edge of the New Forest, past Fordingbridge, Ringwood, and Christchurch, until it falls into the English Channel, just below the last-mentioned town. Near its outfall it receives the Stour, which rises at Stourhead, Wilts, pursues its course in a south-east direction, past Sturminster-Newton, and joins the Avon. The length of these rivers may be estimated as follows:

- The Avon, from its rise to Salisbury, is about thirty-seven miles long, and its whole length is above seventy miles. The Wilsey is about twenty-four miles long, and the Nadder about eighteen miles long, as the Bourne is the longest of them. The Stour is more important, and nearly approaches the Avon itself in length: perhaps its course may be stated at about sixty to sixty-five miles.

5. Various handsome seats adorn the banks of the Avon on its descent to Salisbury, as well as in the lower part of its course through the New Forest. Below Ringwood, indeed, it passes through a less interesting sandy level to Christchurch. The Stour has a very winding course through a country adorned with a number of beautiful seats.

Large ships can get up to Christchurch, where the tide rises seven or eight feet; but a few miles higher up, locks and sluices are required to make the river navigable.

5. The name Avon is given to two rivers in the principality of Wales. One is in Glamorganshire. It rises in the inland part of the county, and after a south-west course of about fifteen miles, falls into the sea below the village of Aber Avon. The other river rises in Monmouthshire and falls into the Usk near Caerleon. It is of about the same length as the foregoing. This last-mentioned stream is distinguished as the Avon Lwyd, or the Torvdyn.

7. 8, 9. Three streams in Scotland bear this name. One is a feeder of the Spey, and rises in the south-western extremity of the county of Banff, close to Caingorm Mountain. Its source is a small lonely loch, called Loch Avon, with steep precipitous banks, rising sheer up almost to the very ridges of the adjacent mountains, and entirely keeping the sun from the surface of the loch during the winter months. Its course is first easterly for about 13 miles, and then northerly for nearly 20 more, until it joins the Spey at Inveravon. Its whole course is about 32 or 33 miles. It flows from the lake in a large rapid stream; and the water is remarkably transparent, so as to appear fordable where it is not really so. In different books of geography it is said to have a course of only about 20 miles.

The next stream rises just within the border of Ayrshire, and flows in a circuitous course till it falls into the Clyde on the left bank near Hamilton. Its length is nearly 29 miles. The banks are high and bold, and in many places covered with natural wood.

The remaining stream runs from Loch Fanny side in Dumbartonshire; and flows first to the east, and then towards the north, falls into the Frith of Forth, a little west of Burrowstones. Its course is rather more than 20 miles; but it would be increased in length if measured from the head of one of its tributaries, the Logie water, which has a longer course than the parent stream previous to their junction. For about half its course, the Avon forms the boundary between the shires of Linlithgow and Stirling.

All these Scotch rivers are called sometimes Avon. (Skrine's English Rivers; Beauties of England and Wales; Camden's Britannia; Ireland's Picturesque Vues on the Upper Avon, &c.; Sir T. D. Lauder's Account of the Great Floods of Moray. The lengths are measured on Arrowsmith's Map of England, four sheets, 1813; and Ainslie's Map of Scotland, in nine sheets; except Nos. 2 and 4, and part of No. 1, which have been measured on the Ordnance Survey.)

AVOSET (Zoology). The vernacular name for one of the genus recurvirostra (Linn.), formerly included among the palnipes, or true swimmers, but now, with greater attention to the habits and affinities of the birds, placed by Vigors among the grallatores, or waders, in the family alopacidae, between the genera tringa (sandpiper) and limosa (godwit), in which last the bill begins to be a little reflected.
The genus recuredivora includes four species—at least
others have yet only recorded so many. The muddy
southern rivers and the banks of estuaries are their
favorite haunts, where they feed on aquatic animals,
as the smaller crustaceans, and mollusks, and the spawn of
fishes. They are deep swimmers, but do not seem to have
be the favorite haunts of the species in European, and
be known for the singularity of the shape of the
back. This animal has the neck long, and the prehensile
fingers provided with nails, by which it can hold and
be distinguished from all other kinds we have hitherto seen or heard of. This species,
recuredivora (Linn.), is widely diffused through
the temperate climates of Europe, Asia, and Africa, the
shores of the Mediterranean, and the islands of
Taiwana, are also stated to be plentifully supplied with those birds, and it is said to
be met with in Egypt and other parts of Africa. In England,
there are those found on the eastern coast below the Humber,
and in the Wash. In the north, and in Scotland, they are rarely seen.

Notwithstanding Ray’s remark, this species cannot lay
claim to such an exclusive singularity in the shape of the
body. To say nothing of the other species of recuredivora,
the red crested, for it is not yet known where, and as there was but one specimen known, there were not wanting
those who looked upon trochilus recuredivora (Swainson)
with the eyes of doubt, and the curvature was considered to
be accidental, or the effect of the position in which the bird
had been placed on the table. In the present instance, the
individuals have, however, since been seen, and Lesson has even
described a second species under the title of trochilus avoca-

That this, therefore, is a genuine form of the kind among the humming birds, there can be no question; but the
structure and mode of vision in trochilus avoca differ widely
from that of the new species.

Pernott well describes the avoca’s bill as ‘very thin,
flexible, and of a substance like whalebone.’ Buffon makes it
the chief object of one of his lamentations over the inexorability
of Nature and her niggard disposition in providing for some of
the less favoured of the animal creation. But, in truth, no
organ could have been devised more admirably adapted for the
function which it has to perform than the bill of the avoca.
A single perusal will show what great value even in
the eye of man it may have. With this view in mind, the
utterance of Buffon becomes a truism.

The avoca frequently visits the west, and its long legs are well formed
for that purpose; for it is the humming bird, and as
present but a thin edge, so as to offer barely any resistance
to the medium through which they have to make their
progress. Though the feet are often pestered with the
wet clay and moss, the position upon the ground is so
favored by bowlers, and figured by Colonel Hawker: this is the
feet of the avoca execute in perfection. Montagu says,
‘We remember one of this species being wounded in the
wrist, which had the tendons so torn, that when it was
taken up alive without ever attempting to swim; so that
the palmated feet seem only intended to support it on
the mud.

The nests of the avoces, which are very inartificial, are
generally formed in the spring, in marine marshes, where
the water is salt. They are built in the fens of
Lincolnshire and Norfolk. The eggs are greenish, spotted
with brown or black. When disturbed, soon after the young
are fledged, the round and round, repeating its pecu-
nlar cry ‘twin twit’—‘twint twit’, and then tittering
lamentously, like the lapwing, to decoy the intruder away.
Pernott gives the following dimensions of an avoca which he shot:
‘Length to the end of the tail eighteen inches, to
the breast twenty-two, the breadth thirty.
The weight was thirteen carates.

The plumage is black and white. The bill is black, and
the legs and toes are of a pale blue, or bluish grey.

AvoYer is a term derived from the Latin ad-
scenario, and was used for the corruption of adven-
tus, and was applied in general to
be champion or guardian of the church. In South
Europe and Switzerland, however, a country so
intensely religious, the term was used.

AvoYer was thus used, and the name of
AvoYer is not found in any edict or
authentic by the title which was most

AvoYer was thus used, and the name of
AvoYer is not found in any edict or
authentic by the title which was most
general in the country, via., the title implying ecclesi- 
astical authority. Thus we find in the beginning of the
thirteenth century, Berthold, Duke of Züringen, styled
the emperor’s advocate in these regions, and Rotholph after-
wards was advocate of Swis. This term, half Germa-
nian, half Gallicized (for the Franks thus governed the
plains of Western Switzerland), became in common parlance
AvoYer, and was assumed by the magistrates of such towns
as had attained the rank of Imperial. This meant that
they belonged nominally to the emperor, whose privi-
leges were considered to be reflected in the
feudal authority. The magistrates of Swiss cities assumed
the title of AvoYer, but the title sunk every where into
common, except at Bern, in which town it lasted till the
revolution of 1798.

AVRANCHES, a city in the department of Manche, in
France, on the south bank of the little river Sée or Sée. The
distance from Paris through Caen is 196 miles
40° 41’ N. lat., and 1° 25’ E. long.

AvoYer is delightfully situated on the side of a hill,
with the ruins of the cathedral crowning the summit. The
river winds at the bottom of the hill, and falls into the
sea two or three miles below the town. The tide flows up to
the bridge over the Sée at the foot of the hill on which the
city is built; and brings up with it a quantity of sand,
which the inhabitants of the surrounding districts use for
manure. The valley of the river is covered with fine
woods and with woods which reach quite down to the shore.

Before the Revolution, Avranches had, besides its cath-
dral, three churches. The Church of Notre-Dame, ruins of which
are now incorporated in the cathedral, were the
residences of the Benedictine convent yet remains, a
seminary for priests, a college, and an hospital.
The cathedral, built in the eleventh century, was pulled
up in the revolution, on the orders of the republic,
and remained so until the Restoration, when the
Republic, determined to cover the roof to convert it into a
barn; and the weather has completed the work of destruction. Mrs. Sisbland, who visited
it in 1818, says, that nothing remained but a few broken
pillars of the interior, and the outer
walls, with a cup engraven upon it, marks the spot where King
Henry II. did penance, in 1172, before two of the Pope’s
legates, for the murder of Becket. According to the last
edition of Malte Brun’s Géographie Universelle (Paris, 1872), a
tower of the cathedral remains, and is the only relic.

From a raised platform or terrace, in front of the
cathedral, there is a very extensive prospect over sea
as well as land.

Small streams can get up the river as far as the bridge
Kemp, Swale, and cotonis, are among the articles of
trade, but the city does not appear to possess any manu-
facture worthy of particular notice. There are a good high-
school (college), a library of 25,000 volumes and 264 manus-
cripts, and 140,000 books. The number of
inhabitants is about 7000. Many English families appear
to have settled here after the peace of 1814.

Avranches was known during the Roman
occupation as Gaul under the name of Inerga, and afterwards by ti of
Gelvania, under the imperial
rule, when the town was taken up alive without ever attempting to swim; so that
the palmated feet seem only intended to support it on
the mud.

The nests of the avoces, which are very inartificial, are
generally formed in the spring, in marine marshes, where
the water is salt. They are built in the fens of
Lincolnshire and Norfolk. The eggs are greenish, spotted

AvoYer is not found in any edict or
authentic by the title which was most
surface of the arëmediesz is given at 478 square miles, or 304,600 acres; and the number of inhabitants in 1832 was 3,812.

The district of Arranbee is one of the subdivisions of Normandy, and included the basin of the little rivers Céune and Sée. The Céune divided it from Brettegne or Bretagne. The Sée and the Céune are navigable as far as the tide. The Céune is not above three or four miles, if so much. The climate of this district is mild, but somewhat humid. Its mildness is attributed by the circumstance that peach trees are grown as standards; while our chestnut trees are generally grown only against a wall. Flax, hemp, corn, and fruit, are the chief productions. Cider is made in considerate quantity, and is in good repute; but no wine is made. A good deal of salt is manufactured on the coast.

(Mrs. Richardson's Letters written during a Tour in Normandy, &c.; Malte Brun; Expilly, Dictionnaire Géographique des Gaules et de la France, &c.)

AWARD. [See Advertisement.]

AWATSAK BAY is a capacious basin on the eastern coast of Kamishatak, lying in the sight between Cape Varase and Cheeponooa Ness, and the only good harbour in the whole peninsula. The entrance, which is by W. tree, is four miles in length, and one and a half in breadth in the bay; that is, the landward side is the succession of bluff points, with alternate sandy bays, produces a very pleasing effect. On the S.E. point of the entrance is a small fort and lighthouse; the latter is only used when the annual visit of vessels from Europe is expected within the season. The provisions and secretaries of the same are at a base of thirty miles in circumference, within which are the three harbours of Rakoweena, Petropaukovski, and Tarenski.

The bay is bounded by high and well-wooded land on all sides, except to the N.W., where the river Awaataik and Paratangass are well wooded, and the sea is off. The general depth of water is from twelve to fourteen fathoms, the bottom level, and of soft mud.

The bay abounds in fish of the finest quality, which are caught with the aid of the sea. An account of the fishery has been made, and the description of their summer is employed in catching and curing a supply for the winter. Salmon, trout, herring, flounders, and smelt are the most plentiful; the salmon are particularly large and fine; they are cured by drying, without salt, that article being scarce and dear.

In June the snow still lies even on the low land, but the change of seasons during the early part of July is very rapid: summer advances without the intermission of spring, and the transition to winter about the beginning of October is similar. The land is generally covered with snow during the winter, and the thermometer falls sometimes as low as −20° of Fahrenheit; the range during the first fourteen days of July was from 44° to 71°, mean temp. 55°.

A boat of sixty miles to each hour, for the very high mountains, and the height of which is nearly 12,000 feet, is fully safe; the sea; the central one is a volcano (of which there are several on the peninsula); these mountains may be seen at the distance of 150 miles. The country is generally filled with mountains, whose sterile sides present striae of grey limestone; agate, jasper, serpentine, asbestos, amethystine quartz, and other crystallised rocks, are found, with many fossils, to which the volcanic action has added the various isuses. The soil of the valleys is a dark rich mould, but as the sea supplies the inhabitants with their chief sustenance, they have no necessity to cultivate the land; a small quantity of rice, with a few potatoes and cabbages, is all that is produced by their labour.

Within the entrance is the harbour of Rakoweena, about four leagues, and one and a half wide at the entrance, narrowing towards the head. It has depth of water for the largest vessels, but a shoal lies across the mouth, leaving only a narrow channel on each side of it, so that vessels can only enter on a very calm day. Two miles to the northward of this is the town and harbour of St. Peter and St. Paul, or Petropaukovski (pronounced shortly Petropauksi), now the capital of the province, and residence of the government and the commercial agency. The town is situated about thirty miles to the westward. There are two small forts for the protection of the harbour, a good hospital, and a school. The town, which formerly consisted of a few huts on the sandy spit across the harbour, is now situated at the head of this small little landlocked bay, which is capable of containing six or eight ships of the line in the most perfect security. The town, from being built without any regard to regularity, has now become a pleasant and agreeable place, and all constructed of logs; on the upper side of each log a gutter is cut to receive the next, and a notch at each end for the transverse log, the ends being allowed to project some inches, and the interstices filled up with moss, which renders the dwelling cool in summer, and protected from the most part thatched, the entrance is intricate, and the visitor has to pass several doors previous to reaching the apartments, which are warmed by hot air conveyed through flues from a large fireplace or oven in the centre of the building. The remotest clearing in the interior of these dwellings amply compensates for the deficiency of external beauty. As a substitute for glass, large plates of mica, brought from Siberia, are used by all classes, except in the governor's house and the public buildings. A new church, in the oriental style, has lately been built near the beach. It is entirely of wood. The chief instrument employed in the construction of these buildings is a long knife, which the natives use with great dexterity. Most of the houses have gardens attached to them, for raising a few vegetables; in the governor's, at the time when we visited it, there were, potatoes, beans, legumes, radishes, and cabbages. The population of the town in 1826 was about 400, exclusive of the men数值 and of the women数值, and 1900 males and 1700 females, including the Aleoutak and Koriaen. Every family has one or two milch cows.

Travelling is performed on sledges, formed of a light tanned skin, sufficient to hold only one person with his skins, pack of provisions and his bag. It consists of two parallel logs, lying side by side, the sledges of two or three feet and eight inches broad, and distant from each other about eighteen inches, and a foot to a little at each end. On this vehicle, which is stained red and blue, and adorned with bits of cloth, there is a bench for the person who sits in the middle, with one foot on the piece of beef, the other provided with a sort of shoe attached to the vehicle by thongs. For the purpose of stopping it, they have a long stick armed at the point with iron, which they plunge into the snow at the forepart of the sledge; the upper end of it is provided with bells, which are shaken to urge the dogs to greater speed. To the vehicle are attached five, seven, or more dogs, always an old one as a leader, and they are guided by word of mouth. These dogs are of the wolf breed; they are ferocious, and burrow kennels for themselves in the snow, or under knolls of earth, and are fed generally on fish. They are very valuable, a good leader being worth 200 rupees, a large sum in Kamishatak. The same set of dogs will travel at a rate of eighty miles a day for two or three successive days.

The Russians have been so long residents among them, that the native Kamishatales are rarely seen in the town, and are generally employed in the mines. The iron, which they bring up from the mines, is of very inferior quality, and produces no market for it beyond the town. To the skinners, who are employed in the manufacture of their clothing for spirits, tobacco, iron implements, a supply of which is brought annually from Okhotok in the vessels which carry away the collection of furs made during the winter. Sable skins are chiefly sought; they are worth from twelve to twenty rupees in the town, and with the exception of the sea-otter, which is scarce, is the only valuable fur obtained; these two kinds are highly prized in China, their principal market. There are also foxes and wolves, and bears are very numerous, chiefly brown.

There are two posts from Petropaukovski to St. Petersburgh in the year, one in April, via Bolcheres and Okhotok, which takes four months; the other, in November, requires eight months, as the sea of Okhotok in the month of August is not to be navigable, and the whole journey must be performed by land, making the circuit of that sea.

Birch, poplar, and aspen are the principal trees: there are also willows. From the bark of the birch the natives make several domestic vessels, and building their houses with the bark. There are various sorts of berries growing wild, the whortle and cranberry very plentiful, and a wild garlice, of which the cattle are very fond, but which impregnates strongly the milk and butter with its unpleasant taste. The most abundant abundance of this: the natures are very fond: when roasted, it serves as bread; when boiled, for potatoes: it has rather a bitter taste, but is very nourishing.

At the head of the bay is the river Awaataik: it is nearly a quarter of a mile broad at the entrance, but soon gets nar...
row. It is very rapid, especially at the season of the snow-melting, and is said to continue its course 100 miles in a N.W. direction, but is so shallow even at its mouth, that it is only navigable for canoes. The small village of Awataska, consisting of eight or ten houses, is situated on the eastern point of entrance.

About five miles S.W. of this is the small river Parish, and the land between these two rivers is very low and swampy.

In the S.W. part of the bay is the spacious and commodious harbour of Tareinski, ten miles long, and three broad, affording every convenience for a naval and naval establishment of the largest kind, free from danger, easy of access, in short leaving nothing to be wished for as a harbour. In consequence of the high land, squalls arise with great violence, which must be guarded against, and the winds are very variable in the bay; but should the progress of commerce put the Pacific on an equality with the Atlantic as to trade (against which no reason can be urged), Awataska Bay must take its rank as one of the first in the world. The lighthouse at the entrance is in 51° 56' N., lat., 156° 47' E. long. Variation of the needle 4° 45' E.; inclination, 64° 52'.

The tides are regular and strong: it is high water, at full and change, at 3 hours 30 min. p.m.; the rise in the springs is 6 feet, in the ebb 2 feet. In the entrance the eddies are very strong.

AWE, LOCH, a fresh-water lake in Scotland, in the county of Argyll. It divides, for a part of its extent, the district of Lorn from that of Argyll Proper. From the head of the Loch (which is not above three or four miles eastward from the head of the inlet called Loch Carnaugh) the sheet of water extends in a north-eastern direction, without much winding in its shores, to the point where it receives the river Urchay, a distance of about twenty-three miles, measured on Langland's Map of Argyllshire; or twenty-four, measured on the Map of Scotland published by the Society for the Diffusion of Useful Knowledge. The breadth, on an average, very little exceeds a mile, measured on Langland's and the Society's Maps, and the greatest breadth is about a mile and a half. If we include the bay or recess from which the Awe flows, as mentioned below, we shall have nearly three miles for the greatest breadth. The General Report of Scotland gives twenty-five miles as the length, and the average breadth at about a mile, but The Beauties of Scotland, Playfair's Geographical and Statistical Description of Scotland, and Webster's Topographical Dict. of Scotland, give the length as thirty miles.

It receives several small streams from the mountains and hills which surround it. The account given in The Beauties of Scotland states that it receives a considerable river at each extremity, but this seems to be an error as far as regards the south-west extremity, which we have spoken of above as 'the head.' At the north-east extremity it receives the Ureby, or Orchy, which comes from the north-east and drains Glen-Ureby, or Glenorchy. On the north-west side, near the middle, it receives a stream from Loch a, a small lake about five or six miles long, and for the most part less than one broad, being distant from two to four miles north-west from Loch Awe.

Near the north-east end of Loch Awe there is a small bay running to the westward, which terminates in a river (the Awe) which enters Loch Etive, an inlet of the sea at Bunaw. From the entrance of the inlet to the mouth of the river is about eight or nine miles (Langland's and Society's Map); the length of the river alone, without the inlet, is about seven miles.

The surface of the loch near this part is studded with small islands, as Inshail, Frosch-Elan, Insh-Channel, Insh-Eath, &c. On Inshail are the ruins of a small Caernarvon convent, with its chapel, and on Insh-Eath the remains of a chapel. On Frosch-Elan are the remains, now trifling, of a castle, granted by King Alexander III. of Scotland to a chiefman, Gilbert M'Naughton, on condition of his entertaining the king whenever he passed that way. Insh-Channel was for several centuries a residence of the family of Argyll. On a rocky point of land jutting out into the loch, and connected by a flat wide meadow, evidently alluvial, with the higher shore, stands Castle Kilchoan, whose square keep was built in the time of Alexander, 2nd Earl of Argyll, by his ancestor, an ancestor of the Breadalbane family. Successive additions were made to it; and it was garrisoned, during the rebellion of 1745, by a party of the king's troopers, but has been since then going to decay. It is for remembrance in the history of the West Highland counties, not so much for the artistic beauty of its parts as for the perfect state of the ruins, than from the very picturesque arrangement of the buildings.

At this end of the Loch are all its chief natural beauties. Dr. M'Culloch, in his Highlands and Western Isles of Scotland, says that 'this great lake is that which lies between its upper extremity to Glenorchy and its exit. . . . To the mere traveller there is no inducement to pursue this long lake throughout its extensive course, as it lies in a dull and uninteresting tract of country, appearing from Inveraray the first views of the lakes are very striking, and, I may add, equally magnificent and wild. They are very different in character from those which appear in approaching from Tyndrum (an inn in Perthshire, from which you go by Glenorchy to the lake), the water appearing to be a confined basin inclosed among lofty mountains, rude and savage in their aspect, but lofty and grand; filling at once the eye and the picture, and literally towering to the clouds. The elevated ridge of the headland by the lake of Lomond is a conspicuous and picturesque boundary: majestic and simple, and throwing its dark shadow on the water, which, spacious as we know it to be, seems almost lost amid the magnitude of the surrounding objects. The castle of Kilchoan, hence a more spot on the whole, but very much deprived of the effect, as affording a scale and an object of comparison.'

Crunachan is a mountainous ridge, which presents some of the finest and most extensive mountain views in Scotland. It is computed to be thirteen or fourteen miles in circuit, sloping gently on the side towards the lake, except near the summit, where the ascent is more abrupt. The summit is divided into two points, each resembling a sugar-loaf. The height is 3669 feet above the level of the sea. The sides are covered with natural woods.

Loch Awe is estimated to be 105 feet above the level of the sea; like Loch Ness and some other lochs in Scotland, it is seldom subject to freezing. Its waters abound with the most delicious fish. The salmon are remarkably good, and the trout are nearly under thirty pounds weight. There are also many eels; but these last the Highlanders hold in abhorrence, concerning them water-serpents, unfit for the use of man.

Loch Avich, which may be considered as an appendage of Loch Awe, is as full of trout, and is the resort of gulls, cranes, eagles, and wild ducks.

At Bunaw, at the mouth of the river Awe, there is a quay for small vessels, which carry peat, ironstone, bars, help, and salmon to Whithaven. There was once a house for the furnaces at Bunaw, meal, coal, leather, &c.

The name Awe denotes water, or a river. The loch, and the river which forms its outlet, both bear it; and it is incorporated in the names Bun-aw and inter-aw. (M'Culloch's Highlands and Western Isles of Scotland; the John
AXH

AWN or ARI'STA, in Botany; the beard of grasses, is a rigid, often hairy, and frequently twisted bristle, proceeding from the back of some of the envelopes of the flower. It is often employed for systematic purposes, in consequence of the number of modifications to which it is subject. It appears to be one of the veins or ribs of the envelopes, unusually lengthened, and separated from the cellular substance to which it belongs.

AX.

A river rising close to a farm called Axmiller, near Chelington, in Dorsetshire, and flowing through Somerseth and Devonshire into the English Channel. Its course is at first westward about 11 miles; then turns to the S.W., and flows 5 or 8 miles, to Axminster; from thence it flows south, then the S.W., and then more to the south, about 9 miles, into the sea, near the village of Axmouth. Its whole course is thus about 23 or 24 miles. It flows through a deep valley between high hills. Its principal tributary is the Yart or Yarty, which rising in Staple hill, just within the border of Somerseth, flows almost due south about 14 miles, and joins the Ax below Axminster.

There is another river Ax in Somerseth, which rises in the S.W. slope of the Mendip Hills, in Wokey or Woake, flows about 12 miles, and its source flows first to the S.E., and then turning N.W. runs parallel to the range of hills in which it rises, into the Bristol Channel. Its whole course is about 24 miles. It flows through the town of Axbridge, which however is about a mile from the bank, about mid-way between the source and outlet. It receives the Cheddar water, which rises from the base of the Cheddar Cliffs [see Cheddar], and flowing between the town of Axbridge and the river Ax, joins the Ax below, about 10 miles, and 10 miles N.W. of Wells. It is a place of little importance, and the only manufacture is of knit stockings.

The town consists of one street about half a mile long, running in a westerly direction nearly east and west. It has a good market for corn, coal, and second-hand goods, and 2 or (according to some three) fairs in the year. The market-house and shambles are near the east end of the town, as is also the church, which stands on an eminence on the very verge of the town, and has a nave, a chancel, and north and south transepts; a chapel on each side the chancel, and a lofty tower at the western end. On the west side of the town, in a sache, stands the statue of a king with his sceptre, and on the west end of the town is a church, which has a churchyard with a church without a roof, and a churchyard with a church without a roof.

AXHOLM, ISLE OF; a river in the county of Lincoln. It is bounded on the eastern side by the Trent, and on the northern and northwestern sides by the river Don, which flows by Crowle, Luddington, and Garthorpe, then a short, serpentine, meandering, and confluence, and forms a boundary between Lincolnshire and Yorkshire. The old rivers of Erne and Idle formed the western boundary; and the ancient Bykersdyke, or Vickersdyke, which runs from Crowland Henry until it joins the Trent, forms the eastern side. In early times the old Don was navigable, and boats could pass by it into the Trent. (See Dugdale's History of Bedfordshire and Drawing.)

The Axmouth is about seventeen or eighteen miles from N.B., and, on the average, five or six miles broad from K. to E., except in the northern part, where it becomes narrower and ends in a point. It includes a small portion of the county of Nottingham, in the parish of Darley, and the village of (and probably the township of) West Street. Leland in his Itinerary (drawn up in the reign of Henry VIII.) gives the dimensions of Axholme as ten miles in length, and six in breadth. The name of Axholme became a corruption of Axel-holme; formed from the name of the principal place Axel (now Axey, a mere village), and the termination holme, which was used by Saxons to denote a river-island.

In the middle ages, and indeed till within the last 500 years or thereabout, Axholme was a most degree with marshes, especially in the western and eastern parts. At a remote period it was a forest, part perhaps of the great forest of the Brigantes who inhabited Yorkshire. Its woods will appear by the following extract from the work of Sir William Dugdale already referred to, which was published in 1662:—

'Being now come into Lincolnshire, I shall first begin with the Isle of Axholme, which for many ages hath been a fenny tract, and for the most part covered with waters; but more antiently not so: for originally it was a woody country, and not at all annoyed with those inundations of the rivers that passed through it, as is most evident by the great numbers of oak, fir, and other trees, which have been seen in many parts. It is indeed true that the ditches and channels for the draining thereof; the oak trees lying somewhat above three foot in depth, and near their roots, which do still stand as they grew, namely, in firm and dry soil below the bank, the low water of the N.W. from the roots, not cut down with axes, but burnt soonowater near the ground, as the ends of them, being covered, did manifest. Of which sort there are multitudes, and of an extraordinary bigness—namely, five yards near the root, which stood likewise as it grew, and was not burnt and not hewed down; these trees are at the bottom ten inches square, and at the top eight.'

About twenty years since, also, in the moors at Thorne (near five foot in depth), was found a ladder of fir of a large dimension, with its branches shoots, burnt down, and a cross, and has a nave, a chancel, and north and south transepts; a chapel on each side the chancel, and a lofty tower at the western end. On the west side of the town, in a sache, stands the statue of a king with his sceptre, and on the west end of the town is a church, which has a churchyard with a church without a roof; but so rotten, that it could not be gotten up whole. And in Axey Carr, at the like depth, a sache with stakes and bindings.

The truth is, that there are so great a number of trees thus overgrown with moss, through a long time of stagnation by the fresh waters in these parts, that the inhabitants have for the space of divers years last past taken up at least two thousand cart-loads in a year.

As to the time when this water (which extends itself into Dikes Marsh and Hatfield Chase in Yorkshire) became first thus overflowed I cannot say anything, there being not any memorial thereof transmitted to us from the light of history or records; but that it hath been so for divers hundreds of years the depth of the moor doth sufficiently manifest, which could not in a few ages grow to that thickness it is of. Howbeit, as to the occasion thereof, I may reasonably conclude it to have been through the inundations of the constant tides, which, flowing up [the] Humber into [the] Trent, did have great power to obstruct the currents of [the] Idle, [the] Don, and other rivers, that, having not their free passage as formerly, they flowed back, and overwhelmed that flat country with water, as much as the depth of the water in time is an unknown quantity, as it is still [we see] called; and a place so defendable, in respect of the spaciousness and depth of the waters environs it, that Roger Lord Mowbray, an eminent baron of this realm in King Henry II. time, and then lord thereof, adhering to this water, so that he did rear thereon a gable and thither and fortified an old castle, which had been long ruinous; for reducing whereof to the king's obedience the Lincolnshire men, having no other access thereto, transported themselves by shipping in the year 1174. So the Axholme.

* The views of this country (which was once a mere swamp or mere the Axmouth) are described by Leland on the south side of the churchyard of Osen (now Osen). The cause was taken on the occasion above-mentioned and rased.
was in [the] 16th year of K [early] III., after the battle of Evesham, when the rebellious barons were disinherited, some of them fled hither as to a place of security, for the reasons above expressed. But after that time it was not long ere the inhabitants of these parts, imitating the good husbandry of those in the northern counties, who had, by banking of ditches, made good improvements in such fenny places, did begin to do the like here; for in the last year of King K [early] III., I find that Robert de Nottingham and Roger de Newmarch were constituted commissaries to repair the banks and ditches, as had been made to that purpose, which were then grown to some decay.* (eh. xxvii.)

Many commissaries were appointed for a like purpose in after times, but still a vast extent of marshy waste remained in that part of the fenfield Chase, which was the neighbourhood, the whole forming a vast level. The impediment to the natural course of the rivers continued; and the water even in summer was in many places three feet deep, so that boats laden with grain passed over the fenfield Chase, and large boats, with twenty quarters of corn in them, crossed the island from the Isle to the Trent. Sixty thousand acres were estimated to be thus overflowed. (Dugdale, as above.)

In the reign of King Charles I., however, the drainage of this level was attempted on a large scale. It had, together with Hatfield Chase, come into the hands of the king as feudal superior; and he, in the second year of his reign (1628), concluded an agreement with Cornelius Vermuyden, or Vermuyden of London, and Robert de Nottingham, lord of the province of Zealand, who undertook, with the support of many of his countrymen, to drain the marshes at his own charge, on condition of receiving one-third of the land so recovered, to hold of the said king, his heirs and successors for ever. For the furtherance of this work, the king granted to Vermuyden the fenfield Chase, and a large part of the fenland, and all the lands in the neighbourhood, including the island of Hatfield Chase, and the island of the fenfield Chase, and the large islands on the river Trent. (Dugdale, as above.)

The work was completed on the 1st of October 1634, and the level was drained by a system of canals and sluices, and the water was conveyed from the Trent to the sea by means of a series of channels, and by a large number of watercourses, known as the "Snow sewer." The work was financed by a royal grant of land, and a rent of one-third of the land reclaimed. (Dugdale, as above.)

The work was well received, and the drainage of the fenland was completed by 1637. Vermuyden was paid for his work, and his influence in the area increased. (Dugdale, as above.)

The drainage of the fenland was an important step in the development of the area, and it laid the foundations for the later industrial development of the region. The drainage of the fenland was a major achievement, and it is one of the most significant events in the history of the area. (Dugdale, as above.)

During the Protectorate, the confusion in the island seems to have continued, and for half a century after the restoration of Charles II., there was no traffic being; but the outside world was not to have the great part of the island at that time present. Nearly three years after the original compact between the crown and Vermuyden, a further grant of the remaining interest of the crown in the level was made over to the latter, for a specified time and a consideration. The rent had been granted by Charles I. to the second Duke of Buckingham, and upon his being declared deposing, had been seized by the state. During the civil war, the troubled times which followed, it had run much ease. (Dugdale, as above.)

In the reign of the new king, the hatred of the king, who, while making the tour of Europe, had engaged in the extraordinary affray of Massainello, at Naples, and had been secretary to that personage, was appointed to collect the rent and the arrears. To keep down the insurgents, they were to be armed and to do force, and to draw up by him in the latter part of his life (1702) he states that he had obtained several writs of assistance, and orders of the House of Lords, and deportations from the sheriff of the three counties; he had provided horses and necessaries, with twenty hired men, and often moved with a surgeon in ordinary; and had, after thirty-one set battles, wherein many of his men were killed, wounded, and lamed, besides numerous mutual indentures, provokes and actions at law, reduced the common inhabitants in obedience, repaired the church, settled another minister, and rendered the district quiet and safe, his son's crops were destroyed in 1712.* Few probably suspect that such disorders could have occurred in England at that time for so long pCuriously conserving the county.

The litigation between the 'commissaries' of Evesham and the settlers continued till 1719. In 1691 a new decree was obtained, awarding to the commissaries (including those of Musterton) 10,535 acres, and leaving only 1000 to the settlers. This consideration, however, was obtained from the Bank, which had indeed acted as the friend and adviser of Vermuyden throughout the whole proceedings, was unfair, and that the opposition, however violently conducted, was not groundless. But the commissaries were not satisfied. They continued proceedings in the House of Lords till 1719, when
these hill was dismantled with costs, and thus the affair ended.
For fuller particulars we refer the reader to Sir William Dugdale's work already mentioned, and Mr. Hunter's Southtown.

It may be mentioned, that Vermuyden himself retired from the concern, after sustaining considerable loss, before the year 1835; and of the foreigners who settled in the level, few, if any, of the descendants remain in the district as yet.

The soil and natural productions of the island are thus described by Leland: "From the west point of Bikern Dale up along (the Idle) to the great mere, the soyle by the water is sunny and morischo and hal of carvases (marshes)." There is a great market held on the pond of the same name.

The principal wood of the isle is at Bellegrove Park, by Heppworth (Epworth), and at Malwood Park, not far from Heppworth. There is also a pricky wood at Crocleo (Crowle), a place belonging to the Manor of Atolebor. The town of Atolebor is said to have been dismantled; but during the spring (from March to May), there is still a cattle market on Monday in every alternate week; there are also three fairs, for cattle, flax, and hemp; and the petty sessions are held here. The church, which is very ancient, presents a fine specimen of Norman (or, as many term it, Saxon) architecture. The living is a vicarage.

There is a charity school, supported partly by endowment, partly by subscriptions; and two meeting-houses, one for Wesleyans, the other for Methodists.

Atolebor was 7 miles south of Crowle, and 11 N. by W. of Gainsborough. It is a long straggling town, the inhabitants of which are chiefly employed in spinning flax and hemp (which, as observed above, are grown in the island), and in the manufacture of sacking and bagging. The market is on Thursday, and there are two fairs in the island. The island was a dependent of Crowle, and was granted by Henry II. to Crowle for many years by the Rev. Samuel Wesley, the father of the celebrated John Wesley, the founder of the Wesleyan Methodists, who was born here; as was also his brother and coadjutor, Charles Wesley; and the Bainforth and Keadby canal, which crosses the island and connects the Don with the Trent, passes within a mile of the town.

Epworth is 7 miles south of Crowle, and 11 N. by W. of Gainsborough. The axioms of all leaves contain rudiments of a bud in a greater or less degree of perfection, and are capable, under favourable circumstances, of bringing it to full development. Gardener sometimes profit by a knowledge of this law, to propagate plants in a manner different from the natural manner in which the leaves are arranged upon the stem, it would be impossible to increase their number by the ordinary modes. Thus a hyacinth bulb is a short branch with rudimentary leaves, called scales, growing closely over all its surface; and consequently at the axil of each rudimentary leaf there exists a bud either latent or manifest. Under ordinary circumstances, two or three only of these buds develop near the outside of the bulb, in the form of crozes, or young buds; but if, at the time when the bulb is just beginning to grow, the scales are cut away in a manner either by cutting it across or searing it with a hot iron, the nutritive matter which was laid up in the bulb, not being expended upon producing flowers and leaves, will be diverted into other channels, and excerting its vital force upon the axillary buds, will cause them to develop in great numbers; and thus the hyacinth will be increased with rapidity, instead of by the slow production of two or three crozes yearly.

Although buds, or bulrush, which is the same thing, are universally axillary to leaves, and, indeed, to every part which is theoretically a modification of a leaf; yet one leaf cannot be axillary to another leaf, although it may seem so in consequence of the inceptive development of an axillary branch to whose system it belongs. Thus in pine trees the clustered, needle-shaped leaves seem to be axillary to the withering rudimentary leaf that grows round their base; but in reality each cluster of leaves is a small branch without perceptible axis, as is proved by the cedar of Lebanon, where the axis sometimes lengthens and sometimes does not.

AXINITE. This mineral usually occurs crystallized in flat, prismatic crystals, with very sharp edges, from which it has received its name. The fundamental form is a double oblique prism, from which Neumann has obtained the following angles:

\[ P = 132^\circ 24' \quad M = 134^\circ 48' \quad T = 68^\circ 39' \]

It is imperfectly cleavable in the direction of the faces M and P. Its colour is brown, sometimes inclining to plum blue; sometimes transparent, at other times only translucent on the edges; its lustre is vitreous. The specific gravity of crystallized variety from Cornwall is stated by Mois to be 2.971, and its hardness 6.5 to 7.

Before the blowpipe it readily fuses with intumescence into a dark green glass, which in the oxidizing flame becomes black on account of the presence of superoxides of manganese. With horax the glass is either green from iron or an amethyst tint from manganese, according as it has been exposed to the interior or exterior flame of the blow-pipe. By fusing it with sulphate of ammonium and flour-spar, the presence of borax may be detected. The following is an analysis by Wiegmann of a variety from Tresseburg, Hartz:—

Borax, however, has marked the iron and manganese as protomites.

The mineral is not very abundant; it is found at Thun in Saxony, where it is sometimes called Thumstone. It occurs at Botallach near the land's end, Cornwall, both crystallized, and forming a rock with tourmaline and garnet.

AXIOM, a word derived from the Greek ἀξίωμα, which is formed from the Greek verb ἀξίζω, to think worthy of; and thence to desire or demand. It was not used in the time of Euclid, by whom the principles which we call axioms are termed "postulata," or common things. The word was not in universal use as late as the year 1600, at which date we find "communis sententia," preferred to "axiom." (See Charles's edition of Euclid, Paris, 1559.)

The term axiom was originally peculiar to geometry, in which science it means a proposition adopted on account of the use to be taken for granted. It is usual to define an axiom as a self-evident proposition; but this, though a true description of all the axioms which are found necessary, is not a definition of what is self-evident. In the first place, the geometer must deduce the properties of space in the best way he can, from the smallest possible number of the most evident principles; and it must be his study to choose them, that his own mind, or that of his pupil or opponent, shall be at the least possible degree of labor.

But he cannot say beforehand that he has an axiom shall be deduced from self-evident principles. Imagine a person of cultivated reasoning powers first approaching geometry, and capable of being made to take a view of the general objects of the science. It would not appear to him certain that he should be able to deduce all the properties of figure from those which are self-evident; on the contrary, he might suspect that he would be obliged to have recourse to the usual methods, in all their commonest preliminaries. At least no answer could be given to him of he did express such a suspicion, except a reference to the science itself; and this clings an axiom, defined as a self-evident proposition, with a condition which can only be verified by the study of the science.

In the second place, a self-evident proposition, as much ought not to be called an axiom, because it is not admitted as such in geometry, however evident it may be, provided it can be proved from those propositions which are called axioms.

Thus, two sides of a triangle are greater than the third, has a greater degree of evidence than some of the admitted axioms; yet it is not taken for granted, because it can be deduced from these.

The Epicureans are said to have laughed at geometry because, among other things, it proves the proposition that two sides of a triangle are greater than the third; which, said they, is evident even to a jackass, who always makes practical use of it in going from one place to another. Thus evidently arises from the mistake that a geometrical axiom is self-evident, and that all self-evident propositions ought to be axioms.

And the oldest remaining opponent of geometry, Sextus Empiricus, has a chapter upon the subject (Physiocrates Hippolytopus, lib. ii. cap. 111), on which of the most noted things of this kind, it is averred, that the axioms of geometry themselves are much clearer than the axioms of metaphysics, on which the opposition to them is grounded. For it is not to be supposed that the opponents of axioms take first principles which are evident to them as principles, but of the same part, or that 'two straight lines cannot enclose a space.'

The necessity that there should be some axioms is evident from the process of reasoning. The deduction of propositions from the comparison of other propositions must have a beginning somewhere, so that there must be at least two propositions to begin with, the evidence of which is derived from other sources than reasoning. Every attempt which has been made to dispose with axioms altogether has been as much expected, as it could be other than, or other in the process assumed theorems have been found.

The more modern discussions which have arisen about axioms appear to us to proceed from some fallacy of that sort, that the idea conveyed by the whole of a sentence must be more cogent than that of any one part, or at least, that it must at all events be easier to understand separately upon the consideration of the auxiliary forms of speech in which a simple idea is conveyed, before that idea can be said to be explained. As an instance, in that most simple of all propositions, 'two and two are four,' which by itself is comprehended as soon as spoken, we have the (by itself) difficult phrases 'are the same, implying identity, and leading, if pursued far enough, to many other abstruse applications of the word.'

In proper science, and considered with reference to other objects, are not misplaced; but, as applied to geometry, are not only unnecessary, but subversive of the natural order of
reasoning: for however much may be said upon maxims, axioms, first principles, or by whatever name they may be called, there remains the simple proposition, 'two and two are the same as four,' clearer, as a whole, than any one of the explanations, illustrations, or comments, which have been brought to its aid. There is, however, this to be said for many writers who have endeavoured to make such points better known than they are already; namely, that the older writers, in their love of what is called the a priori method, had filled their books with notions against which it was necessarily impossible toası explain or to analyse, a confirmed habit of reasoning upon the nature of self-evident propositions. Locke (Book iv. chap. 7) on Maxims can hardly be intelligible to a reader who has not some knowledge of what the school of modern speculation signifies, unless it were resolved it was necessary to contend both against words without meaning, as when they said some such thing as that knowledge is the likeness of the thing known, formed in the knowing faculty: and also against errors, such as general propositions are known, at least sometimes, before particular ones. The axioms employed by Euclid, and which have been for the most part adopted by other writers on geometry, are evidently constructed with a very close attention to meta-

physic distinctions, and for the purpose of introducing the defini

6. Let it be granted, from any point to any point, to draw a straight line. 2. Also, to lengthen a finished straight line, and continue it straight. 3. Also, with any centre and radius (intercepta, meaning interval measured from that centre) to describe a circle. 4. All things which are double to the same are equal to another. 5. Also, if equals be added to equals, the wholes are equals. 6. Also, if from equals equals be taken, the remainders are equals. 7. Also, if to unequal equals be added, the wholes are unequal. 8. Also, if from unequal equals be taken, the remainders are unequal. 9. Also, things which are double of the same are equal to one another. 10. Also, things which are halves of the same are equal to one another. 11. Also, things which fit one another (have the same boundary) are equal. 12. Also, the whole is greater than the part. 13. Also, all right angles are equal to one another. 14. If, a straight line, falling upon two straight lines, make the angles which are within and upon the same side less than two right angles, the two straight lines, being lengthened without convergence together, will meet upon that side on which are the angles less than two right angles.] 15. Also, two straight lines cannot inclose a space. 16. The two axioms. 10 and 11, enclosed in brackets, is in some measure peculiar: for this last has no doubt was the true original; for it will be observed that they have no claim to be headed euclièmes (common notions), being propositions of some little intricacy, though they are, in their form, things demanded as necessary to establish the of the general proposition. There is nothing in the words of Euclid which implies that he wished to separate 'problems granted without construction' from 'theo-

1. Those of which the truth is conveyed in the words themselves, and which could not be denied without altering the meaning of the words. These are the eighth and ninth of the 'common notions.' 2. Those which have no peculiar reference to geometry, but are true of all kinds of magnitude, as well as of spaces or lengths. These are the first seven of the 'common notions.' 3. Those which have direct reference to geometry. These are the three demands or postulates, and the last three of the 'common notions.' What is required to be conceded in the three postulates, is not that a straight line or circle can be imagined to be drawn, in the sense usually attached to these words, but that the geometrical line can be drawn, which is length without breadth. This is impossible, me-

chaneously speaking, the line being a conception of the mind which cannot be executed. [See Line.] The tendency indicates that a self-evident property of the straight line, a term incapable of other defini-

tion than that which is contained in its proprieties; that is, we can make no use of the obvious notions conveyed in the words 'straight line,' unless we admit some one or other of its distinguishing characteristics, which is more definite than saying that it lies evenly between its extreme points. We might appear to deny thereby saying, let the name 'straight line' be given to that species which is under any circumstances, inclose a space; but in that case we should need another axiom—namely, we should require it to be granted that there is such a thing as the straight line, and that we have not an absurd contradiction in supposing the above species of lines to exist. It must be remembered, that though the definitions are placed at the beginning in Euclid, it is not thereby implied that the terms defined are really possible. Let lines which, being in the most remote places, do not meet if produced, be called parallels, does not mean us to assume that such lines do exist, but only, that when they shall have been proved to exist, the name by which it is agreed to call them has been given.

The axiom 10 is a theorem of more difficulty than the subject requires, since, with one additional assumption respecting the straight line, it admits of proof. The assumption previously discussed, namely, that two straight lines cannot inclose a space, is very evident; and that two straight lines coincide in two points, or if two different points of the one can be made to lie upon two different points of the other, the portions of the straight lines lying between these points coincide entirely. Let it be granted, in addition, that the parts which are not coincident are both parallel to one side (an equally evident proposition), and the 10th axiom of Euclid admits of proof. Euclid, in taking this axiom for granted, makes use of it to prove our additional assumption, not that a straight line may be produced, but that it is, as he phrases it, 'to form a common segment;' that is, two lines cannot coincide between two points and not coincide elsewhere. But, of two propositions, one of which it is found necessary to assume, that one should be the more simple of the two. In the theorem of some difficulty, neither self-evident, nor even easily made evident, is not at all required in the form given, even in Euclid. For he proves, without its assistance, that if the two lines there mentioned meet, it must be on the side on which the angles are less than two right angles. It may be reduced to a very evident form as follows: If a straight line be taken, and a point exterior to it, of all the straight lines which can be drawn through the point, one only will be parallel to the first-mentioned straight line. The whole assumption lies in the word only; for Euclid shows, without the help of this axiom, that a parallel can be drawn, and how to draw it. This axiom is the cause of the celebrated discussion on the theory of Parallelism, under which head it will be more carefully described.

It appears, then, that geometry is established upon two results of observation, experiment or intuition, by whichever name it may be called, independently of axioms which are common to the whole science of quantity, and excluding propositions of the possibility of certain notions laid down. These two propositions are—

1. That two indefinitely extended straight lines, which coincide in two points, coincide altogether in every part. 2. That the straight lines which can be drawn through a given point, meet any other line in the same plane (with the exception of one at most) if produced far enough.

At the same time, many other tacit assumptions may be met with in Euclid which are not formally placed among the axioms. In the first proposition for instance, it is tacitly assumed that two circles, one of which is partly within and partly without the other, will meet in one point at least: in the fourth, it is assumed that change of place, without change of form, is possible. These also would not be expressed among the formal axioms we find 'the whole is greater than its part;' after which we have a right to conclude that no proposition, however evident, will be taken for granted without being distinctly and formally enun-

ciated as an axiom.

AXI6. AXK. This word is used in so many different senses, that it may be defined as follows: any line whatsoever which it is convenient to distinguish by a specific term with respect to any motion or other phenomenon considered. Thus, we have a line of motion, of oscillation, of inertia, of rotation, of polarisation, &c., under which heads definitions will be given.
The word, when used by itself, generally means either axis of Rotation, or axis of Symmetry. An axis of rotation, or revolution, is the line about which a body turns; an axis of symmetry is a line on both sides of which the parts of the body are disposed in the same manner, so that at whatever distance it extends in one direction from the axis it extends as far in the direction exact opposite. Or if perpendicular to the axis be drawn from all points and in all directions through the body, the whole of each perpendicular which is within the limits of the body will be bisected by the axis. Such is the middle line of a cone, any diameter of a sphere, the line drawn through the middle of the opposite faces of a cube, &c.

AXIUS, a species of Indian deer. The word is also used generically to denote a small group or subgenus of saddle-backed mammals with slender limbs, inhabiting the same climate as the common axis. [See Damr.]

AXIUS, in zoology, a genus of long-tailed decepted cricetans, founded by Leach on Arix eurypus, which is about three inches, or three inches and a half in length, and rarely found on our coasts. It has been taken near Sidmouth and Plymouth. Desmarest, with much reason, considers this genus entirely artificial, and thinks that it ought not to be separated from Calomysces. [See Calomysces.]

AXIUS, a river of Macedonia, now called Vardar, which empties itself into the Gulf of Salonica near the western part of the bay. The alluvial depictions have encroached greatly on the gulf, leaving a low and swampy land, interspersed with numerous small branches forming inlets of high reeds, and rendering the principal branch difficult to discover. The entrance is very intricate, being much obstructed by shoals and sandbanks, but the river is navigable for the large country boats (from twenty-five to thirty tons) for several miles. It runs about N. by W. nearly a straight course for eight miles, when it is joined from the eastward by a small stream navigable for boats (possibly the ancient Echeidna); then taking a more westerly direction, it becomes more tortuous. Four miles above the junction is a ferry on the road from Salonica to Thessaly, and about as many miles higher up the river is crossed by a solid wooden bridge on the road to Polis. The delta of the river depends on the season of the year: during the summer there is not more than four feet under the bridge; but as the bottom is of soft sand, it is hazardous to ford. From this point downwards the river appears to have debouched from its ancient bed, which may still be traced about six miles from Salonica to the west, and to have taken a more westerly direction; it is now joined, about a league from the sea, by the Kasa Armak (apparently the ancient Lydas), flowing from the north of Polis. The nearest point of the river is now about sixteen miles west of the town of Salonica, whereas there is a carriage road to Polis.

The Axios has its sources in the ranges between Scardus and Orthodox, about ninety miles in the interior; it is joined by several small streams, but possess no town of importance. Macedonians (vu. 154) descend the Echeidna as far as through Mygdonis, and encroaching the gulf in or close to the marsh at the mouth of the Axios. In the age of the historian to the Axios was the boundary between Mygdonis on the east, and Boiotia on the west, along the shores of the gulf. The topographer of Strabo (book VIII.) says that the Axios is a muddy stream: he also states that a branch or channel of the Axios runs into that lake in which Pella stands, and out of which the Lydus flows into the gulf. According to Herodotus (vu. 197) the Lydus and the Athamon united before they reached the sea. This does not appear to be the case at present. [See Cousin's 'Macaronis.]

AXIMINSTER, a market-town in the hundred of Axminster, county of Devon, on the road from London to Exeter, 147 miles S.W. of the W.S.W. of the latter. It is called Axminster in Domesday Book, and Axymyster in old writings. It is said that the name is owing to King Athelstan having given the church to seven priests who were to pray for the souls of certain earls and the last king of the house of Ceridwen in this neighbourhth. The college was not built up after the death of the first members.

The town is on the left or S. E. bank of the river Ax or Axe, and is irregularly built on the side of a little hill rising from the river. There are three great stiles in the walled enclosure, presenting the same character, and indicating the ecclesiastic with a mutilated effigy. Besides the parish church, there are three places of worship belonging respectively to the Roman Catholics, Independents, and Methodists.

The chief manufacture of the place is carpets. In 1835 it rivalled the productions of Turkey and Persia so successfully, that the carpets of Axminster are considered little inferior to those imported. They are woven on an entire piece of ground, without a single seam, and are made of wool, and there are also made. There is a market on Monday; but the business done in corn has become inconsiderable. There are three (or, according to some authorities, four) fairs in the year, chiefly for cattle. The population of the parish (which is divided into the several hundreds of Axminster and of Axminster) is 3212. The church is a contemptible edifice with a mutilated effigy. Besides the parish church, there are three places of worship belonging respectively to the Roman Catholics, Independents, and Methodists.

The manufacture of Axminster was the property of the Crown. King John bestowed it on the Lord Browne or Brouwer. After some changes it came to the Cistercian Monastery at Newnham, since very scanty remains of which are still seen near the town: and upon the dissolution of the monastery in the reign of Henry VIII. it fell again to the Crown. James I. granted it to Sir W. P. de P. Peires, afterwards Lord Peires, in whose family it still remains. It is said there was formerly a castle at Axminster.

In an action near this town, between the Rivezians and Parliamentarians, in 1645, the Prince of Orange was captured, and was afterwards rescued from other powers, under the influence of the peace made by Sir R. Cholmondeley, who commanded the forces that was killed.

The Rev. Mr. Thwaite Towgood, an eminent Dissenting minister of Exeter, was born to this parish.

[The baronetcy of the Barons of Axminster, in the dignity of Magna Britannia; and his baronetcy in the dignity of Gentleman, in the barony of the Barons of Axminster.]

AXOLOTL (Ambystoma mexicanum), a singular genus of batrachian reptiles, belonging to the percombranchiate family, or those which retain their gills throughout life, and distink species of the same family by having four feet, furnished with toes before and five behind. This very remarkable group, containing at present but four small genera — the Axolotl, the Ambystoma, the Proteus and the Necturus — comprises the genus Ambystoma, which Whitman has divided into two subgenera, one bearing both lungs and gills, and which are consequently organized to live either on land or in water. These, therefore, are, strictly speaking, the only true Ambystoma in nature; for though there is still a fourth genus, and meet the Axolotl in a manner that resembles the Cordyloba, see Axolotl; note the lateral meaning of the word restricts it to the new species not given to it, and excludes not only the reptiles in general, but the Axolotl in particular. It has been applied to it, but even the more ordinary
brachichians—the frogs, the toads, and the salamanders—which, though furnished with gills in their tadpole state, lose them as soon as the lungs are developed, and at no period of their lives possess this double organization simultaneously. The transitory union of these two great systems of respiration, as exhibited in the tadpoles of the croakies, toads, and salamanders, and how it is seen to naturalists and physiologists; but their permanent and simultaneous existence was a fact much out of the way of common experience, so that it is not surprising that zoologists should have received it at first with doubt and hesitation, on which they, and we ourselves, could not pass any judgment. The animal, as we now know it, is the young of the ancient genus of reptiles, which, in common with all other animals, has a branchial apparatus in its tadpole stage, which serves to supply it with air during its development before the organs of respiration developed. Repeated observations, however, have made this view universally admitted, that certain reptiles not only possess both these respiratory systems at the same time, but even preserve them permanently throughout their entire lives, and can consequently breathe either air or water according to the circumstances in which they happen to be placed.

Among the animals thus circumstanced, the axolotl was particularly remarkable, because its branchial apparatus, long before any other species. At the period of the Mexican conquest, the Spaniards found this animal in great abundance in the lake which surrounds the city of Mexico, to the inhabitants of which it furnished, as it still continues to furnish, an article of food. Hernandez, who seems to be the first writer who actually described the axolotl, expressly mentions having been thus used by the ancient Mexicans, and adds, that the flesh was considered as an aphrodisiac, that it was wholesome and agreeable, and tasted not unlike elk. Succeeding authors, without taking the trouble of observing for themselves, were content to copy what Hernandez had said before; but distorting his short description by absurd comments of their own, and adding the figures of far different species, the whole subject became at length involved in such inextricable confusion, that finally all memory of the axolotl was lost, or the animal itself considered as a fictitious being. The late Dr. Shaw, however, who received a specimen of the animal direct from Mexico, and to which the axolotl of Hernandez refers, is justified by his having used the generic term, Gyrrinus, in his account of it published in the Naturalist's Miscellany, which had been originally applied to it by its first describer, though Baron Cuvier seems to have deprived the Briton of this credit, and to ascribe the sole honour of rediscovering the axolotl to Baron Humboldt. It is indeed true that Dr. Shaw subsequently described the same animal, in the third volume of his General Zoology, under the very different name of stenops, that he considered it, as Baron Cuvier was himself afterwards inclined to do, not as a perfect animal, not in fact as the type of a new genus, but rather as the immature state of some species belonging to a genus already known. To Baron Cuvier himself, however, we are indebted for the complete description and elucidation of the form and organic structure of this curious reptile. Two specimens, brought by M. Humboldt from Mexico, were submitted to the examination of the French naturalist, whose researches on the structure of the stomach, and the muscles, nerves, and arteries of the tadpole stage, and the gradual change which they undergo in passing from this stage to their mature and perfect form, led Baron Cuvier to establish as an unquestionable fact, that certain of these animals retain both lungs and gills through-out their entire lives, an opinion which he had previously expressed in his work on the stem and proteus. He was disposed to consider the axolotl as the tadpole of some of the larger species of the ancient salamanders, an error induced as well by the general similarity of these animals to one another as by the immature age of the specimens of the axolotl which were submitted to his observation. Succeeding naturalists adopted M. Cuvier's views upon this subject; but that

great zoologist himself subsequently altered his original opinion, and candidly confesses in the second edition of the Regne Animal, that the concurrent testimony of all original observers overbalances the mere deductions of the physiologist, however plausible or apparently well founded. He has accordingly admitted the claim of the axolotl to rank as a new genus in the Systema Naturae, but as he has not provided it with a proper generic name, it is but justice to Hernandez and Dr. Shaw to retain that of gyrrinus, by which it was originally distinguished and described; and which, though perhaps not exactly intended by either of these authors to be taken in the strict acceptance of a modern generic appellation, may nevertheless, and particularly in the present advanced state of the science, be considered in this technical sense with considerable advantage to zoology.

The generic characters of the genus gyrrinus then, in addition to those already reported, consist in having the gills formed of three long ramified or branch-like processes on each side of the neck, four toes on the anterior extremities, and five on the posterior, and teeth in the vomer, as well as in both jaws. The tail is compressed on the sides like that of the common water-newt (salamandra palustris), and surrounded both on the upper and under surfaces by a thin, erect membranous fin, which is prolonged upon the back, but becomes gradually narrowed or tapering as it approaches the shoulders, between which it finally ceases. The head is broad and flat, the nose blunt, the eyes situated near the muzzle, the tail nearly as long as the body, and the toes unconnected by intermediate membranes. The singular ovaries lying between the gills will be best understood from the accompanying figure, which represents the under jaw and throat of the animal as seen from beneath. One species only is known at present—

[Axolotl. Gyrrinus edulis.]

The Axolotl of the Mexicans (Gyrrinus Edulis, Hernandez), when full grown, measures about eight or nine inches in length; its ground colour is a uniform deep brown, thickly mottled both on the upper and under surfaces of the head and body, as well as on the limbs, tail, and dorsal and caudal fins, with numerous small, round, black spots. The head and body are larger and broader than in the generality of reptiles, and but for the long tail which terminates the latter, the whole animal might be not inaptly compared in form to a large frog; the gills are prolonged into three principal processes, with numerous smaller ramifications from the sides of each, the whole being as long as the fore legs, and resembling three small branches; the legs are short though fully developed, and the toes are long, slender, separate, and without claws. The communications which open from the gills into the mouth are four in number, and of a size considerably larger than those of the kindred
such is a description of the only species of this genus which has been hitherto distinctly characterised. M. de Beauvois has, indeed, described an animal under the name of *Siren Operculata*, which, if not the Azoloi of M. Lacepede, is scarcely to be at least a very closely-allied species, but we do not possess data upon the subject to warrant us in considering it, even temporarily, as a second species of the present genus. Still it is highly probable that further researches will furnish the means of distinguishing other kinds species, and travellers and observers who have the opportunity could not employ themselves more agreeably than in pursuing this curious and interesting inquiry. The Azoloi is very common in the lake of Mexico, and, according to Baron Humboldt, likewise inhabits the cold waters of mountain lakes at much greater elevation above the level of the sea than the plains surrounding that city. It is commonly sold in the markets of Mexico, and esteemed by the inhabitants; it is dressed after the manner of stewed cels, and served up with a rich and stimulating sauce.

**AXUM**, a town of Abyssinia, in about 14° 7' N. lat. and about 120 miles from Arkeeko, on the coast of the Red Sea. The most recent published account that we have of this place is from Mr. Salt, the late British consul in Egypt; that of Rüppell, a German traveller in Abyssinia, is not yet published. The town stands 'partly in and partly at the mouth of a foss formed by two rivers on the N. end of an extensive and fertile valley, which is watered by a small stream.' One of the objects that first strikes a traveller is a small plain obelisk, with the remains of many others lying near it; but the great curiosity is the large obelisk, a kip of granite, in the middle of the town. It stands near a large Daroo, or fig sycamore, as it is represented in Plate XX. of the folio coloured engravings that accompany Salt's work. This obelisk has no hieroglyphics upon it like those of Egypt, nor does it exactly agree with them in shape. Though it is quadrilateral, one of the sides has a hollow space running up the centre from the base to the summit, which, instead of terminating in a pyramid like the regular obelisks, is confined to a vertical cylinder. At the bottom of the hollow space just described, a doorway is represented. The reader may form a better idea of this from Mr. Salt's beautiful drawing, or, in the absence of that, from our reduced copy of it. The obelisks of Axum were originally fifty-five in number, and four of them, it is said, were as large as that now standing; yet nothing is known of the period at which they were erected, though we can hardly doubt that they belong to a period not earlier than the Christian era. Among the antiquities of Axum is a stone which contains the inscription of one of their ancient kings, characters, and has been copied by Mr. Salt; that on the opposite side, of which Mr. Salt could only copy a small part, he believes to be in Ethiopian characters, and also contains the possibility, that it was cut at the same time with the Greek inscription.

Besides the obelisk, there is a Christian church at Axum, to which there is an ascent by two fine flights of steps. The church itself, which is not two centuries old, is 111 feet long, 51 broad, and 45 high, with a flat roof, and no great beauty in its architecture. Another remnant of former times, near the church at Axum, is a square enclosure, with a pillar at each corner; within it are a seat and a footstool; the whole is of granite. On this seat, tradition says, the saviour Christ was when he was translated. From this stone, which he calls a freestone, an inscription of three Greek words, which, he says, 'though much defaced, may safely be restored.' As restored by him, they signify 'King Ptolemy Euergetes,' but Mr. Salt, and his fellow travellers Mr. Skey and Mr. Stukeley, assure me that there is an inscription at all on the footstool, while there is an Ethiopian inscription on another granite stone, resembling a footstool, thirty yards from the genuine footstool. Mr. Bruce's account of this place is probably true; but, if it is certain that he did not see the large Greek inscription, though the Jesuits had observed it long before him. (See Telles, *History of Ethiopia*, i. cap. 22.)

The language of the Axumites is first noticed by the author of the *Periplus* (see Great Survey) of the Red Sea and part of the east coast of Africa, &c. This document, which is still extant, was written probably about the close of the second century; but how long this Axumite empire had existed before, we are not able to say. The Greek inscription, which was copied by Mr. Salt, shows us that the monarch of Axum had an extensive empire; in Axum and its co-extensive at least with the present province of Egypt, and his possessions extended even into Arabia. Through the port of Adul on the Red Sea, Axum maintained a commercial intercourse with Arabia and India; and it was probably for some advantage to be secured to Greek merchants from Egypt in the Indian trade, that the Byzantine Caesars paid a yearly tax to the Axumite king until the commencement of the Arab conquest. Axum was the great emporium for ivory, which was exported through Adul. (Periplus; Hudson's Minor Greek Geographers.) It may be mentioned as a curious fact, that when the Emperor Aurelian took Palmyra in the Syrian desert, he found among the assembling of nations within its walls some Axumites, probably traders. The Byzantine writers, such as Procopius, Cedrenus, &c., call both the Axumites and the Hermenites (Himyares) of Arabia Indicae, while they carefully restrict the term Ethiopians to the Axumites. It appears, then, that for a certain period, at least for several centuries after the Christian era, the vague term Ethiopians was used in a limited sense, and applied to a people who inhabited one of the large districts now forming a part of the modern Abyssinia. We may conjecture, but we cannot in the absence of all evidence affirm, how the Greek language got to Axum, and how it came to be adopted by the native kings. The most probable hypothesis would be, that as the Greeks gradually got a footing in Egypt, and finally, after the time of Alexander, became masters of the country, so these restless people spread even into Ethiopia, where some had adventurers, partly by conquest, partly perhaps in other ways too, because the ruling caste, and formed a dynasty of half Greek sovereigns, whose resemblance to their own nation would gradually fade away, on account of their constant
easy to barbarous tribes, and their distance from the centres of Greek civilization. Axum was probably the first part of Abyssinia into which Christianity was introduced. In the Apology of Athanasius, which is addressed to the Emperor Theodosius 2. N. 381., there is given a copy of a letter sent by Constantius to Axum (’Αλεποψ) on the subject of Frumentius. This letter is addressed jointly to two persons, named Azenas and Semasnas, without any indication of one being superior to the other. Both, however, are named as the sovereigns of Axum. From this letter it appears that Frumentius had been appointed Bishop of Axum by Athanasius. The emperor intimated that the imperial decree is as valid in the Alexandrians as in the Roman church, and he accordingly ordered them, under a threat, to elect Frumentius as bishop, and that his appointment and qualifications might be examined by Gregory, who then held the see of Alexandria, in place of Athanasius who had been ejected, and by the bishops of Egypt. [See ATHANASIUS.] In conclusion, the emperor addresses the two Axumite princes by the title of 'most honoured brethren' (ἀξιοὺς τιμίας). See the works of St. Athanasius, by the Beneficences of St. Maur, vol. i. pt. 1. p. 315.

It is a singular coincidence that the Greek inscription copied by Mr. Salt records the name and exploits of Asenas, King of the Axumites, Homerites, &c.; and that Semasnas is also mentioned in the same inscription as one of his brothers, who, with Adaphas, took up residence with the modern Beja. Adaphas is not mentioned in the letter of Constantius. The inscription commemorates the success of the expedition and the clemency of the victorious sovereign, who styles himself the son of the sun. It is a remarkable fact that the inscription belongs to the same epoch as the letter of Constantius. Athanasius was driven from his see about a.c. 354, and the letter of Constantius must have been written soon after. It is a reasonable inference from this letter that Constantius considered the Axumite princes as Christians; but from the inscription, which appears to refer to the same personages, it is clear that when this monument was erected, the sovereign was a heathen; and yet the Axumite monarchs began to maintain a place at least as early as a.d. 330. The difficulty may be solved by supposing that the monument was raised before the mission of Frumentius; or perhaps better by supposing that the heathen forms continued to be used on public occasions even after the introduction of Christianity.

Another sovereign of Axum, called Elesban, is mentioned by Cosmas, a Greek writer of the sixth century of the Christian era. A comparison of the inscription of Adul, as reported by Cosmas [see ADUUL], shows that the inscription ascribed to Adul is anterior to that of Elesban, and that the inscription of Axum is posterior to that of Adul. In both inscriptions the king calls himself the son of Ares, who seems to have been the guardian god of the family. In the Adul inscription the king calls the sovereign of those nations, of which the king mentioned in the Axum inscription simply calls himself sovereign. It appears from these inscriptions that the Axumite dominion extended into Arabia, and comprised the Humyradas, called by the Greeks, Homerites. [See ARABIA. p. 215, &c.] Dr. Alexander Murray, in one of his letters to Salt (see Hall's Life of Salt), supposes the monument of Adul to be nearly of the age or century of Cosmas himself; and he founds this opinion on the identity of the names of the two kings, and observes, 'That the Axumite king Elesban, the contemporary of Cosmas, and El Atabe or Caleb. But the premises, even if correct, lead to no such conclusion. As far as the internal evidence of the two inscriptions goes, that of Adul is undoubtedly the older, but whether it is the same as the list of Axumite kings is another question.

Mr. Bruce brought from Abyssinia a copy of the Abyssinian Chronicles, or the Book of Axum; but this work has not yet appeared in English. It is intended to be 'An Arab extract by Mr. Bruce. A YACUCHO, the name of a plain in Peru, in South America, in the district of Guambana. It is bounded on the east by the abrupt ridge of Condoncarqui, or Con-
AYL

Spantius under Valdes drove them back, and followed across the ravine. The division of La Mar rallied, and, supported by the mounted grenadiers, also crossed the ravine. Colonel Plaza, of the independent army, did the same with his legion on the left, and Lieutenant-Colonel Moran at the head of the battalion, Barioz, on the right. The sea-room and the support of the valley, made their repeated charges so successful, that Valdes was defeated, and his four field-pieces taken. The Spaniards now began to rally the remains of their army on the heights, and the divisions of La Mar gave the summons at about 11 o'clock. Sunset the royalists sued for terms. Cantonero rode down to the tent of Buero, and a capitulation was agreed upon, by which the vicecy, 13 general officers, 16 colonels, 444 officers, and 3,000 men because prisoners of war. The white cap was surrender to Barioz in all, with the exception of Callao, was also surrendered to the independent. The royalists had 1,400 men killed and 700 wounded. The loss on the part of the Americans was 370 killed and 689 wounded.

(See Mem. of General Miller, vol. ii. ch. xxiv. xxv.; Annual Register; American Annual Register.)

AYLON, a city in Spain, in the kingdom of Seville, 37° 12' N. lat. 7° 19' W. long. It is situated on the slope of a range of hills, where the river Guadalquivir enters the ocean. It is a fortified town opposite to Castromarín, in Portugal, the capital of the district which bears its name, and comprises thirty villages. There are in Ayamonte two parishes, five hermitages, two convents of monks, one of nuns, and a hospital. The population of the city is 6,337, of which number are fishermen, sailors, and ship-carpenters, and the remaining part are employed in agriculture and commerce. The women make fishing-nets and lace, which latter article is much esteemed in Southern Europe. There are some soap manufactories, a few brick and lime-kilns, and some of common earthenware. In the neighbourhood of Ayamonte there are forests of fir trees, which are employed in the building of ships. The town is fortified. It produces great crops of wheat and of corn. The castle is of very old construction. The place was conquered by the Moorish king of Granada in 1496. The inhabitants of Antequera wrested it from the hands of the Infidels two years after (1498). See Antequera. (Milano's Dictionario, vol. i. and ii.; and Manana, lib. ix. e. 16.)

AYEN AKBERY, properly AYNI-AKBARI, is the title of a geographical and statistical account of the Mogul empire in India during the reign of the emperor Jehfeildin Mohammed Akbar (see Akyar), written by his vizir Abul Fazl. [See Abul Fazl.] It constitutes properly the third or concluding part of the Akbarnamah of the same author: the first volume of this work consists of a narrative of the life of Akbar, and the second is a description of the empire, and the occurrences of his reign, from his accession to the throne down to the 47th year. It has been translated into English, and undertaken by Mr. Francis Gladwin, and begun to be published at Calcutta, in 1783. It has twere been reprinted in England. As an original, and we may say an official account of the internal organization of the Mogul empire at the time of its greatest prosperity, the Ayni Akbari is highly interesting. It is divided into four parts: the first three are chiefly political and legislative, containing the regulations of the different households, military, and revenue offices, and showing the manner in which these several departments are managed; the fourth part is chiefly statistical, and contains a table of the province of Bengal, with a description of the several provinces at that time comprehended under the Mogul government, and a detailed account of the ancient institutions, religion, and literature of the Hindus, which is very comprehensive, and in many parts surprisingly accurate. This work is, however, a superficial survey of the countries, many of which are very instructive, and it abounds in notices of general interest and of great utility for the history and geography of Asia. Among them we shall but mention the comparative account of the principal races of Asia, as well as the races of the different nations of Asia, and a long list of geographical names, arranged according to the Oriental plan of the seven climates, and stating the longitude (from the Happy Islands) and latitude of several places.

AYLESBURY, a considerable town in Buckinghamshire, on the road from London to Warwick and Birmingham, thirty-eight miles from London, through Wathor, Berks, Reading, and Thame, about two miles north-west of the town. It consists of several streets and lanes irregularly built. The elevation of the town above the general level of the Great Plain is about 100 feet higher and is frequently felt by the inhabitants; but the houses are now well supplied by means of machinery in the goal, which is worked by the prisoners. The town is also well paved, and lighted with gas.

Although Aylesbury does not give name to the county, it seems to have the fairest title to be considered as the county town. The quarter-sessions are always held here. Lord Chief Justice Baldwin caused the removal of the assizes to this town from the reign of Henry VIII. but in 1750 Lord Cobbold procured an act of parliament for holding the summer assizes at Buckingham; the Lent assizes are however still held at Aylesbury, where also is the county jail. It is the place where the county members are nominated at, and the elections are held.

The county hall is a handsome brick building, erected in the earlier part of the last century. The old town-hall and market-house, built at the expense of Lord Chief Justice Baldwin already mentioned, have been lately replaced by a new building on the site of the present one. The town has a church in South Street, which is of ancient building, and is the parish church, from its being the nearest to the town, and is an every direction. The church contains little that is remarkable. There is a monument of Sir Henry Lee's, who died in 1841, and a marble effigy dug up some years since in the ruins of the church of the Grey Friars, supposed to be the remains of Sir William Lea, who died in 1460. The pulpit is ornamented with some curious carved work. The churchyard is very large, and has several walls planted with double rows of trees. There are many almshouses for Independents (formerly for Presbyterians). Baptist, Quaker, and Methodist Meeting Houses. There is a school, the origin of which does not appear to be clearly known. It was endowed with some bequests by Sir Henry Lee, of Ditcheley, in Oxfordshire, before the year 1667: but the principal endowment is consequent upon the sale of 5,000l. left by Mr. Henry Phillips of London, in 1714, and invested in the purchase of land, which, with the other resources of the school, produces an income of nearly 54s. The school buildings are adjacent to the churchyard, and are ceded to the schoolmaster and the other for the writing or English master, with a schoolroom connecting the two. In this school-room 100 boys are taught by the English master, while twenty more are instructed by the head master in the different branches of a classical and a military education, and are supported by the income and about the town, or distributed in money and clothing to the poor. There are five large cottages near the church gate, occupied as almshouses, bequeathed by a person of the name of Lee, which income is employed in repairing the houses and about the town, or distributed in money and clothing to the poor. There are also a considerable property left by William Harding of Walcot, in 1719, for the purpose of apprenticing poor children. And there is a school to be opened for the education of boys and girls on an average bound year. There are many minor charities. (Reg. of Commissaries of Charities, January, 1811.)

The only manufacture carried on in the town is of lace. There is a market on the first and last day of every month, and in the year, chiefly for the sale of cattle. A market once held on Wednesday has been deserted.

Aylesbury was made a corporate town and a parliamentary borough by charter of Queen Mary, in 1534. The corporation consists of a bailiff, two town, and thirty-four burgesses; but the powers of the charter expired (see so as
There was a house of Grey Friars at the south end of the town, founded by James Earl of Ormonde in 1387, but it was very poor; the revenue, at the time of the suppression of religious houses under Henry VIII, being valued only at £1 2s. 3d. per annum. It became the seat of Sir J. Bald- win, Lord Chief Justice of the Common Pleas, to whom Henry VIII. granted it in 1547. His descendants were the Biddington family; but it was so much damaged in the great civil war, that it was never afterwards inhabited by them.

The vale of Aylesbury extends on the S.W. to Thame.

The other boundaries, except on the south side, are rather difficult to ascertain. Leeland makes the vale extend 'otherways to Buckingham, to Stony Stratford, to Newport Pagnell, and amongst from Aylesbury by the Roads of Child- well, of the Great and of the Lea.' The Hunsdon Hills bound the vale on the south side, and run in a direction N.E. and W.S.W., near the town. They are formed of chalk. The vale is better calculated for grazing land than almost any in the kingdom; but when the agricultural report of this county was drawn up in 1784, the method of farming seems to have been little creditable to the skill and industry of the agriculturists. Grazing and dairy farming seem to be at present the chief objects of attention, and to be followed at no great distance.

AYLESBURY.

This town, as may be seen on the map, is situated on the right bank of the Medway, a little to the left of the road from London to Maidstone, thirty-two miles and a half from the former, and about three miles and a half from the latter. The town consists of a high street, and the front part of the town is one large building, with a square tower at the west end, situated on an eminence at the back of the village. It contains a costly monument of Sir John Bankes, bart., who died 1699.

The ground rises so abruptly, that the churchyard is higher than the town, and is surrounded on three sides by the chimes of the church. The town is within a stone bridge of six arches over the Medway; and in Aylesbury-street is a building erected for an almshouse, and endowed by the will of John Sedley, in 1695, for a warden and six poor persons, but not yet erected. At one supposition the property has been diverted to private use, though now, by means of the commissioners for inquiring concerning charities, it is likely to be recovered, and the charity re-established. Aylesbury has one fair in the year, on the 29th of June. The parish extends on both sides of the river: it contains 3330 acres, and had in 1831 a population of 1301 persons. It includes the hamlet of Milbale, on the left bank of the Medway, and in the civil jurisdiction of the Corporation of Maidstone.

The living is a vicarage in the gift of the Dean and Chapter of Rochester. It is in the diocese and archdeaconry of Rochester. The church was granted by Henry I. to the bishops of Rochester. One of these gave it to the priory of that city; but by one of his successors it was, towards the close of the twelfth century, transferred to the newly founded hospital at Stroud. The monks of Rochester priory appealed to the Pope; and after many years contest, and many decrees and confirmations in favour of each party, it remained with the hospital. The master of that institution appointing a vicar to celebrate divine service. Just before the dissolution of the religious houses, the master and brethren of the hospital resigned their hospital and all its possessions to the Prior and convent of Rochester; and the vicarage, by the direction of the King, was granted by him to the king by letters patent, into the hands of the king, he granted the advowson of the vicarage to the Dean and Chapter of Rochester, in which it is still vested.

An endowment of 20s. per annum for a charity-school was bequeathed by a Dr. Charles Milner, of Preston Hall, in this parish, who died in 1771.

Close to the Medway, a small distance west of the village, was a Carmelite friary, founded a.d. 1246, by, or under the patronage of L. de Grey, the 4th. Of monasteries, the site, precinct, and lands of this were granted to Sir Thomas Wyatt, and on the rebellion of his son in the reign of Queen Mary were forfeited to the crown. Queen Elizabeth granted them to the Sedley family, and since that period have been in possession of the family of Aylesford. In the bosom of this family, and in the do- mestic offices, many portions of the friary buildings are still
visible. We take the following description from Hasted's History of Kent.

'The greatest part of the ancient priory remains very fair, and by far the least demolished of any conventual edifice in these parts. The great gate from the road is yet to be seen, and has a large square arch, in which are several all the doors to the cells. The side where the high buttresses are left, on the left hand within the gate, was the great hall or refectory, now divided into rooms. The kitchen was likewise on the east side of the square, as appears by the large fire-places in one part of it. The chapel was that part of the burning which stands east and west; the north side of it fronts the garden as the south does the river; the east window of it was where now is the dining-room or gallery-door with the iron balcony facing the town. The principal part of this priory, as the hall, chapel, cloisters, &c., was converted into stately apartments by Sir John Banks (who resided here in the latter part of the seventeenth century), and the cloisters were by him inclosed and paved with white and black marble. There is a fair high stone wall which fronts the road and incloses the garden, the same as when in its ancient state. (Vol. iv. 2d ed. 1794.)

There are in the parish the ruins of the ancient free chapel of Longsole, now used as a barn, and called, from its lonely situation, 'The Hermitage.' It is about two miles from the town, on the other side of the Medway. On the window-frame of a large ancient barn (belonging to Preston Hall in the parish), built of stone, as well as on an out-house near it, are the initials of a chaste lady, with the date 1773, and letters TC with the date 1102 in Arabic figures. The use of these at so early a period has given rise to much discussion among antiquaries: the inscription is probably of a much later date, and refers not to the date of the erection of the building.

But the most remarkable monument of antiquity is that called Kit's Coty House, situated on the brow of a hill, about a mile N.E. of the village. It is composed of four large stones, the other three are of the same kind, and according to Grose, while Hasted vaguely describes them as being 'of the pebble kind.' The following description of this monument is given by Bow in his Chronicle, and quoted by Mr. Colebrooke, to which the following note is added: 'I have myself, in company with divers worshipful and learned gentlemen, beheld it in anno 1590, and is of four flat stones, one of them standing upright in the middle of two others, inclining the edge sides of the first, and the fourth laid flat above the other three, and is of such height that men may stand on either side the middle stone in time of storm or tempest safe from wind and rain, being defended with the breadth of the stones, having one at their backs, one on either side, and the fourth over their heads; and about a foot from the top, or from another upright stone, much part thereof in the ground, as fallen down where the same had been affixed.' This last stone, says Mr. Colebrooke, 'lies about seventy paces to the N.W. in the same direction and thickness is half buried; but from its present position, it seems as if it had once stood upright.' It has since been buried 'for the convenience of agriculture.' It may be observed, that the openings formed by the stones of Kit's Coty House are not of equal dimensions, but the larger one fronts between E. and N.E., whence some writers (as Grose) describe them as forming three sides of a square. The upper stone is not quite parallel to the horizon, but inclines towards the W. or S.W. opening, in an angle of about nine degrees. The dimensions of the stones are as follows. 

**Upright Stone on the N. or N.W. side, eight feet high, eight feet broad, two feet thick:** estimated weight, eight and a half tons.

**Upright Stone on the S. or S.E. side, eight feet high, seven and a half feet broad, two feet thick:** estimated weight, eight tons.

**Upper stone between these, very irregular, medium dimensions, five feet high, five feet broad, fourteen inches thick, about two feet square:** two feet thick. 

**Upper stone, very irregular, eleven feet long, eight feet broad, two feet thick:** estimated weight, about ten tons, seven cews.

None of the stones have any marks of workmanship.

At the distance of two fields southward from Kit's Coty House, in the bottom nearer to Aylesford, is a heap of the like kind of stones, some of which are partly upright, and others lying in a circle round them, in all to the number of nine or ten. Those that are partly upright, with a large one lying across them, appear to have once formed a kind of structure like that of Kit's Coty House, and to have had the same aspect: the whole heap is now intergrown with elms and other coarse shrubs. This monument of antiquity is supposed to have been demolished by some persons digging a trench beneath it, in hope of finding treasure. (Hasted's History of Kent.) Still nearer to Aylesford is a remarkable stone, called, from its shape, the Coffin.

Respecting the origin of Kit's Coty House, as well as of its singular name, different opinions are entertained. It appears that about A.D. 455, soon after the arrival of the Saxons in England, under Hengest and Horsa, when hostilities broke out between them and the Britons, a battle took place at Aylesford, one of the three which are thought to have compelled the Saxons to leave the island for a time (Turner's History of the Anglo-Saxons, book iv. c. 1.). In this battle, Catigern, brother of Gwentmeur, or Wortmer, the British commander, fell, as also Horsa, one of the Saxon chieftains. It is commonly supposed that this is the monument of Catigern; and the name, Kit's Coty House, is considered by Bow, Camden, Grose, and others, to be derived from the name of that person. Grose has the passage: 'Perhaps the appellation of Kit's Coty House (so he writes it) may be thus illustrated: Cat or Cuss is possibly the familiar abbreviation of Catigern; and in Cornwall, where there are many of these monuments, those stones, whose length and breadth greatly exceed these three thickness, are called cats.' Kit's Coty House may then express Catigern's House built with costs, and might have been a taunting reflection on the memory of that champion for the British liberty, used by the Saxons when in possession of the county of Kent.

Mr. Colebrooke inclines to think that it is the sepulchral monument of Horsa, which is commonly supposed to be at Horsted, a manor a little to the left of the road from Rochester to Maidstone, about two miles from the former, where are many large stones scattered about the fields, some standing upright, others thrown down. (See Hasted's Hist. of Kent.) The name of Kit's Coty House Mr. Colebrooke supposes to be derived from some old shepherd, who used to keep sheep on this plain, and to shelter himself from the weather in this monument. (Arched. vol. iv. p. 110, et seq.) considers Mr. Colebrooke's hypothesis very doubtful, and regards this and other cromlechs as places of devotion rather than sepulchral monuments. Bede (quoted by Mr. Colebrooke) observes that the place where Horsa was buried retained his name, but the words are 'hastopen in orientalibus (ante partibus monum-mentum habuit suo nomine imaginis). Now we suppose no one will pretend to say that the name of Horsa is incorpo-rated in the present tale of this monument. The name is variously written: Keith Coty House, by Camden; Keops House, by Larder (Aemulation of Kent, ed. of 1688); Cits Cotthow, by Bow; and differently by other writers.
Besides the above engagement, between the Britons and Scyths, Aylesford deserves notice as the place to which Edwina, a daughter of King Ethelred, was transferred by her father, to secure her from the attacks of the Danes, whom he had defeated at Osford. Dr. Plot was inclined to fix the Roman station Vagniacae at Aylesford; but he does not appear to have any followers in this opinion.

The town appears to have been variously written. The Saxon Chronicle calls it Ayleisford. According to Nennius (a British historian of the early part of the seventh century) the Saxons called it Epsiford, and the Britons Bæthesnegul, or Saienensis-Hoxall, from the overthrow of the Roman power. Under that name it is still known, and, ab. 900, calls it Eslethreph: In Domesday Book it is Ellesford.

The manor of Aylesford was, at the time of the Domesday Survey, of royal descent. It was subsequently held by the Grevys of Codnor, the Wyatts, and others.

In one place in the parish are several springs, which change the stones in them, as well as pieces of wood, to a carmine hue, which never lasts, but when they are taken out and have become dry. The water flows from a deep chalky loess soil, is very chilly, and has a rough taste; but there are no chalybeate qualities belonging to it. (Hasted's History of Kent.)

See also AYLESHAM (written in Domesday Book 'Elesham'), a market-town in the hundred of South Erpingham, in the county of Norfolk, about 11 miles N. by W. of Norwich, and 129 N.N.E. from London through Norwich, or 118 through East Dereham. It is on the right side of the road from Norwich to Dereham, about a mile from a turnpike road, called the 'Alesham Wells and Aylesham Lines,' and the fine cloth of Alesham. According to the Latin annals of Henry VIII. the linen manufacture had in a great degree given way to the woolen, and about the time of James I. it was chiefly inhabited by knitters; but this branch of industry has since disappeared. The church is endowed with the revenues of the manor, and is now possessed by the patronage of the Crown.

Aylsham was, in the time of Edward II. and III., the chief place in Norfolk for the linen manufacture; and in old records the 'Alesham wells and Alesham lines,' and the 'fine cloth of Alesham' are mentioned. The addition of 'of the church of St. Mary,' to the name, from the time of Henry VIII., was the linen manufacture had in a great degree given way to the woolen, and about the time of James I. it was chiefly inhabited by knitters; but this branch of industry has since disappeared. The church is endowed with the revenues of the manor, and is now possessed by the patronage of the Crown.

The church, dedicated to St. Michael the Archangel, was built by John of Gaunt, duke of Lancaster, fourth son of Edward III., in the fourteenth century, and is in the decorated English style. It has a nave and chancel, and a tower with a spire, and is said to be the finest in the county. The church was originally called St. Peter's Church, and the chancel the Church of the Virgin Mary. There was a square tower, with a spire on the top. The church contains several monuments, and the presentation is in the hands of the dean and chapter of Canterbury, to whom the vicarage rectorcy was granted. There are two dissenting places of worship.

There is a national school at Aylsham. It was originally a free-school, endowed by Robert Jannys, who was mayor of London, and living near the manor-house (with a house above an acre of land, and 1/10th paid by the corporation of Norwich), and it is chiefly supported by voluntary contributions. The school is well instructed.

The town and Aylsham is the most agreeable in Norfolk, and when Blomfield wrote his history (towards the middle of the last century) it was much frequented in the summer season on account of a spa or mineral spring, about three miles to the north-west of Aylsham. Aynsley and Aylsham furlong is a street extending from the town to the river Ayr, near its mouth, and is seven miles S.W. of Edinburgh, and 34 S.N.W. of Glasgow. The name Ayr is supposed to be of Celtic origin, and to have been first given to the river, from which it has been transferred to the town; the meaning is thin, or shallow.

The principle street of Ayr, called High Street, is a wide and fine road, with two rows of well-built houses. The town is lighted by gas, and was entirely repaved some years since, so that it is now one of the cleanest and best-paved burghs in Scotland.

At the end of the street is the old bridge over the Ayr, connecting the town with Ayrshire, the Ayr, which, though a distinct parish, may be considered as a suburb; and, with the adjacent villages of Wallace Town and Content, is included in the boundaries of the present parliamentary borough of Ayr. A little below this old bridge is a new bridge, a magnificent structure, built in 1882, which connects Sandgate-street in Ayr with Main-street in New Town.

At the junction of High-street and Sandgate-street stand the town public buildings, consisting of an elegant range of assembly-rooms, and a public reading-room, which is supplied with periodicals and newspapers. There is a spire in the centre of the building 212 feet high, which is much admired. These buildings were erected by the corporation at the cost of 10,000£. Near the south end of Sandgate-street is Wellington-square, the name of which indicates its modern erection, lying at its western extremity the county buildings, containing court and record rooms, and other public offices. Behind these is the county jail for debtors and criminals erected on the most approved principles, and in an airy situation near the sea. Wellington-square is of considerable size. From the houses on the north side to those on the south, it is about 300 feet wide, and the length from the road towards Carrick, into which it is divided, is about 300 feet. The axis of the street, about 600 feet. South of it another square, of much smaller dimensions, has been commenced, as well as a number of new streets in the same neighbourhood. In High-street is a new building called Wallace Tower, erected in the place of an old one on the site of the payment house of Henry VIII. It is said to have been the occasional residence of the Scottish hero. In front of the building is a statue of Wallace, executed by Thom, the sculptor of Tam O'Shanter and Souter Johnnie. Ayr has a number of public institutions for persons in easy circumstances, professional men, and tradesmen and others who are employed in the town, and from the residence of several of the gentry. There are two banking establishments, besides branches of the Bank of Scotland and the Union Bank of Glasgow, and the banks are in the seat of the coal trade. The different character of the population of the two places may be estimated by this, that though the parish of New Town has more than half as many inhabitants as Ayr, there are only 40 female servants, while in Ayr there were 100. A small number of bankers, professional and other educated men; New Town only 31.

The harbour is formed by the mouth of the river Ayr; and from each side of the mouth a pier runs out into the sea as far as the water will allow, and the north pier (that of Ayr) is about 1250 feet, and the length of the north pier of the harbor (that of New Town) about 1150 feet*. There is a bar at the mouth of the harbour, and the depth of the water at spring tides is fourteen feet; so that vessels exceeding 200 tons registered burden can be brought over the bar in safety. There are two light-houses to guide vessels into the harbour. The dues exceed 1000£ annually.

There are two parish kirkis in Ayr: the old one stands at the back of the High-street, on the east side of the town; and the new one at the head of Cathcart-street. The parish kirk in New Town stands in Main-street, not far from the bridge. Besides these places of worship of the establishment, there are Episcopal and Catholic churches, and there are also a number of dissenters: viz., Burgesses, Anti-Burgesses, Relief, Camerons, Independents, Methodists, and Moravians.

Close to the new parochial kirk of Ayr is the academy, which, from the liberality of the trustees, is open to the children of the town for the education of their children. The number of scholars averages from 500 to 600 annually: the building is very handsome. This has benefited the town by causing an increase of the buildings, and an improvement of the town.

* The measurements generally made on the plan contained in the boundary reports.
coast to Carrick, are a number of villas, chiefly inhabited by persons who are in business in Ayr.

To the west of the town, between it and the shore, stood the fort built by Oliver Cromwell, but demolished at the restoration of the Stuarts. It was defended by six bastions, and two or three places appear to have been intended for the accommodation of men of war. In the year 1660, a tract of land for 1000 acres, was included in the ancient parochial kirk of St. John the Baptist; in which the Scottish Parliament met to confer the title of Robert Bruce to the throne of Scotland. This kirk is now a ruin, and a new one, viz., that which is mentioned above as "the Old Kirk," built in 1634. The tower of the kirk with the fort still remains, and there are some relics of the fort itself. Ayr is one of the most ancient towns in Scotland, and it stands on the high and historic coast of the southern circuit (corresponding to the English suasive courts) is held. Sheriffs, justice of peace, and burgs courts, and also regularly held.

The trade of Ayr, in former times, consisted in a great degree in the importation of wine from France, and the population was then considerable. There was a tradition, that nearly 250 years ago 2000 persons died of the plague. Subsequently the town declined; and in 1745 the population (of the parish, as it seems) was reckoned at no more than 3000. In 1811, the burgh had 13000 inhabitants; and as in 1755 it was returned near 3000. At present the trade of Ayr consists chiefly in the export of coal to Ireland, and in the import of timber and deals from British America, and Scilly and other islands in the Baltic. Building and fishing are carried on to some extent, the sandbanks of the coast abounding in all sorts of white fish. A considerable woollen manufacture has been lately commenced, which bids fair to be attended with beneficial results. The rise of New Town into importance is more recent than that of Ayr, and has been owing to its collieries, which are now flourishing. The population of the burgh and parish of Ayr in 1831, was 7608; that of New Town, 4620; and Wallace Town and Content, 4277;—together, 16,000. The two were weekly market, the one on Tuesday and Friday, and four fairs in the year.

Ayr is said to have been a place of note at the Norman Conquest, and was erected into a burgh by William the Lion, king of Scotland, in the year 1292. The corporation consists of a provost, two bailies, a dean of guild, a treasurer, and twelve councillors; and has an annual revenue of £2400, and a debt approaching to near £20,000. The jurisdiction of the magistrates extends over the whole parish. It is a constituent burgh, returning corporately with Irvine, Campbeltown, Inverary, and Oban, the last three in Argyllshire, one member to parliament.

New Town is a burgh of barony; the burgesses or townsmen are limited in number to forty-eight, and each possess a lot or freedom in consuming ten acres of arable land, besides the right of pasturage on the common of 130 acres, which right is enjoyed only by the burgesses. The common revenue of the burgh is small. The community meet every year to elect their magistrates and officers, when two bailies, a treasurer, and six councillors are chosen.

The boundaries of the parliamentary borough of Ayr, as fixed in 1792, comprehend the three parishes of New Ayr Town, and St. Quivox, and contain a population of 14,017.

The coast to the north and south of Ayr is flat; on the east the country rises gradually. The soil of Ayr parish seems to be better than that of New Town. They are both in the abbey of Ayr, and in the synod of Ayr and Glasgow. The New Town was erected from the land of from about 500 acres of arable land, close to the north of the town. In the parish of Ayr (at least, in that of Alloway which has been long annexed to it), Robert Burns was born, in 1759. The town is situated by the road-side, about two miles from Ayr, and is protected by a strong wall, the towers of which are conspicuous from the sea, and some relics connected with him. The scene of the sea is delightful in the extreme, which causes it to be a place much resorted to by strangers. Burnet.

Scotland, or Erigone, one of the lights of the dark ages, and the Chevalier Ramsay, are claimed as natives of the parish of Ayr.

There was formerly a monastery of Dominicans, or black friars (the first they had in Scotland), and one of the most prosperous. A statue of the Virgin Mary was said to have worked many miracles without tears.

(Weber's Topographical Dict. of Scotland; Sinclair's Statistical Account; Playfair's Description of Scotland.)

AYRSHIRE, a county in the S.W. part of Scotland, deriving its name from the town just described. The Firth of Clyde, an arm of the sea which washes it on the west, forms a bay, at the bottom of which is the town of Ayr. The town divides into nearly equal parts the portion of coast belonging to the county, being distant, in a straight line, about sixty-six miles from one another, and about thirty-five miles from the southern. The distance of the two extremities from another in a direct line is about sixty miles. Such a line would be in a direction nearly N. by E. and S. by W.

The inland boundary, leaving the northern point of the coast just mentioned, runs in an irregular line towards the S.E., and separates Ayrshire from Renfrewshire and Lanarkshire; after it reaches the most eastern point (which is about forty-four miles from the northern extremity of the county), and about twenty-six or twenty-seven miles E. by N. of the town of Ayr), it turns to the S.E., and with many windings reaches the southern point of the coast, which is distant from the most eastern point of the shore about sixty-six miles in a straight line. This last part of the boundary divides this shore from those of Dumfries, Kircudbright and Wigtown.

The southern and eastern parts, with a small portion of the northern part, are the most hilly; and some of the eminences are of considerable height. Along the shores of the Frith are narrow plains, abounding with gravel; the inland country rises into hills, which incline, as within an amphitheatre, the best part of the county. The principal hills are as follows:

Knockdolian, a conical mountain near the coast in the southern part of the county.

Carntyble, in the eastern part of the county.

Birkside-end, on the parish of Carrick, near the river Ayr.

Carleton Hill near Knockdolian.

Knicknaw.

Ben-erard, in the southern part of the county.

Misty Law, on the border of Renfrew and Ayr.

Ailsa Craig, a rock off the coast.

Brown Carrick Hill, a little way south of the town of Ayr.

Ayrshire is a natural basin. Many streams rise near the inland boundary, and flow through the county into the sea, but the shortness of their course prevents them from becoming of much importance in a commercial point of view. The Irvine, rising in the north, and pursuing a course parallel to the south, unites with the Irvine, which comes from the east; or rather, both these rivers fall into Irvine barracks. The Irvine, which is the larger of the two, is about twenty miles long. The Ayr crosses the county at about five miles from east to west, and falls into the sea near the town of Ayr. It has a course of from thirty to thirty-five miles. The Lugar is its principal tributary. The Doon rises from several small streams on the S.E. border of the county, and passing through Loch Doon, flows N.W. through the parish of Minchinton, and Prestwick, and forms a separate stream in 1779.

In the parish of Ayr (at least, in that of Alloway which has been long annexed to it), Robert Burns was born, in 1759. The town is situated by the road-side, about two miles from Ayr, and is protected by a strong wall, the towers of which are conspicuous from the sea, and some relics connected with him. The scene of the sea is delightful in the extreme, which causes it to be a place much resorted to by strangers.
The mineral riches of Ayrshire are considerable. Coal is abundant, especially in the middle and northern parts of the county, considered as the most important coal-field in Scotland. Railways and railroads have been formed to carry the coal trade. The coal is of different varieties, among which is the black coal, found in the central part of the county; and another is the bituminous coal, found near Saltcoats. The coal-field near Saltcoats is divided into three parts by two dikes of natural walls of whinstone. The county affords abundance of limestone. Freestone is quarried in great quantity; and there is some whinstone quarried near Millport. Millstone is also quarried at Kilbride, near the northern part of the county, and is in great request for their hardness and durability. They are said to be exported even to the West Indies and to America. Near Auchinleck is a quarry of whinstone used for building purposes, on account of its power in resisting the action of fire. The whinstone known by the name of Waters-of-Ayr stone is found near the banks of the river Ayr. Marl is also procured in many places.

Limestone is procured at Muirkirk, near the eastern extremity of the county, extensive iron works are carried on. Lead, plumbago or black lead, antimony, and copper (of which the quantity is small) may be considered as nearly completing the list of all the minerals of Ayrshire. (Playfair’s ‘Geographical Description of Scotland’; ‘ Beauties of Scotland’)

There are several mineral springs. But none of them of such repute as to attract many visitors.

The soil of this county is thus distributed by Chalmers in his ‘Caledonia’:

<table>

</table>

The light or sandy soil is met with along the coast, interspersed with a deep and fertile land. On the boundary the moor lands, intersected with moors, occur. Of these moors, Laird’s moss and Moss Mallock, which last is partly in Lanark and Renfrew shires, may be noticed for their extent. In the parish of Muirkirk and Renfrew Cumnock, which are in the east part of the shire, more than half the land is moss. The clay soil, which constitutes so large a portion of the land, varies in its character: it is, in some parts, strong and productive, while in others it is spongy, wet, and cold; producing much of fattening cattle, and merely sufficient for keeping alive a breeding stock. (Fullarton’s ‘General View of the Agriculture of the County of Ayr’)

Till about the middle of the last century, the agriculture of Ayrshire was in a most wretched condition. There was scarcely a practicable road; the farmers’ houses were mere hovels; the lands were overrun with weeds and rushes. The arable farms were small, for the tenants had no stock for larger occupations; the tenure was bad, and the tenant helpless by a multitude of tyrannous services to the landlord. The land, divided into the croft or infield, and outfield, was either neglected or worn out by successive crops of oats, as long as they would pay for weeding, labour, or by an ill-managed rook. For in some places, there are enormous rooks, one bearing from four to six-rowed barley, followed by a year of rest. The wretched condition of the country may be judged of by the fact, that little butchers’ meat was used by the farmers, except a portion salted at the farm; potatoes and turnips furnished the principal food of the tenants. Even in the town of Ayr, containing from 4000 to 5000 inhabitants, not more than fifty head of cattle were slaughtered annually. A succession of bad seasons, at the end of the eighteenth and beginning of the present century, obliged hundreds of families to fly for subsistence to the north of Ireland; and the poor were not unfrequently obliged to subsist by bleeding their cattle, and mixing the flesh with any animal they could procure. (Fullarton’s ‘General View’, &c.)

Wheat is not cultivated to any great extent; and though the quality of that which is raised is good, yet the cultivation of it is attended by many disadvantages. Big and rank corn is generally used in the country; but the principal grain raised is the oat, in which the county stands pre-eminent, both for quality and produce. Turnips are increasing; potatoes are universally cultivated; and the artificial grasses on all improved farms. Fats also are raised. The best rotation of crops is considered to be oats or beans, raised after ploughing up a grass field: after these, in dry soils, turnips or other green crops, such as kale, vetches, tares, or potatoes. In very strong soils, drilled beans, cabbages, and carrots may be substituted in the place of turnips. These are usually cut in the summer and used as artificial grass seeds. After the clover, wheat or oats, and, in very light lands, rye. (Fullarton’s ‘General View’, &c.)

Lime is the most common manure. On the coast, seaweed is much used, and sperges waste is in great request with some farmers. Green manure is also cultivated.

The cattles of the southern part of the county are chiefly reared for the market, and are for the most part of the Galloway breed. They are commonly black or brindled, though some are white or dun, and the best are without horns. They are very hardy, and grow fat where the large heavy breed of some other counties would be starved. Great numbers are yearly sent to England. The cattle in the northern part of the county are partly the Dunlop breed, which has been established there for a century and a half. They are remarkable for the quantity and quality of their milk. Besides these, there is a breed of brown and white mottled cattle, which is considered to have...
genus; they are covered externally by a species of operculum formed by a fold in the skin of the head.

Such is a description of the only species of this singular genus which has been hitherto distinctly characterised. M. de Beurnouil has, indeed, described an animal under the name of Siren Operculata, which, if not the Azotol of Mexico itself, appears to be at least a very closely-allied species, but we do not possess data upon the subject to warrant us in considering it, even temporarily, as a second species of the present genus. Still it is highly probable that further researches will furnish the means of distinguishing other kindred species, and travellers and observers who have the opportunity could not employ themselves more agreeably than in pursuing this curious and interesting inquiry. The Azotol is very common in the lakes of Mexico, and, according to Baron Humboldt, likewise inhabits the cold waters of mountain lakes at much greater elevation above the level of the sea than the plains surrounding that city. It is commonly found in the markets of Mexico, and esteemed a luxury by the inhabitants; it is dressed after the manner of stewed eels, and served up with a rich and stimulating sauce.

AXUM, a town of Abyssinia, in about 14° N. lat., and about 130 miles from Arkaeko, on the coast of the Red Sea. The most recent published account that we have of this place is from Mr. Salt, the late British consul in Egypt: that of Rüppell, a German traveller in Abyssinia, is not yet published. The town stands partly in and partly at the mouth of a nook formed by two hills on the N.E. end of an extensive and fertile valley, which is watered by a small stream. One of the objects that first strikes a traveller is a small plain obelisk, with the remains of many others; but the greatest curiosity is the large obelisk, sixty feet high, made of a single block of granite. It stands near a large Daron, or fig sycamore, as it is represented in Plate XX. of the folio coloured engravings that accompany Salt's work. This obelisk has no hieroglyphics upon it like those of Egypt, nor does it exactly agree with them in shape. Though it is quadrilateral, one of the sides has a hollow space running up the centre from the base to the summit, which, instead of terminating in a pyramid, like the regular obelisks, is crowned with a kind of patera. At the bottom of the hollow space just described, a doorway is represented. The reader may form a better idea of this from Mr. Salt's beautiful drawing, or, in the absence of that, from our reduced copy of it. The obelisks of Axum were originally fifty-five in number, and four of them, it is said, were as large as that now standing; yet nothing is known of the period at which they were erected, though we can hardly doubt that they belong to a period not earlier than the Christian era. Axum was the capital of Ethiopia, a name which contains two inscriptions: that on one side is in rude Greek characters, and has been copied by Mr. Salt; that on the opposite side, of which Mr. Salt could only copy a small part, bears Cyclades characters, and also conjectures, with great probability, that it was cut at the same time with the Greek inscription.

Besides the obelisk, there is a Christian church at Axum, to which there is an ascent by two fine flights of steps. The church itself, which is not two centuries old, is 111 feet long, 51 broad, and 40 high, with a flat roof, and no great beauty in its architecture. Another remnant of former times, near the church at Axum, is a square enclosure, with a pillar at each corner; within it are a seat and a footstool; the whole is covered with grass. On this is a stone which says, the antients were crowned. Bruce (vol. iv. p. 323) gives from this stone, which he calls a freestone, an inscription of three Greek words, which, he says, 'though much defaced, may safely be restored.' As restored by him, they signify: 'King Phidarny, Euergetes.' But Mr. Salt and his fellow travellers Mr. Smith and Stuart, assert that there is no inscription at all on the footstool, while there is an Ethiopian inscription on another granite stone, resembling a footstool, that belongs to the same foundation. Bruce's inscription is therefore probably not true; at least it is certain that he did not see the large Greek inscription, though the Jesus had observed it long before him. (See Talles, History of Ethiopia, i. cap. 22.)

The constitution of the Axumites is first noticed by the author of the Periplus (in Coast Survey) of the Red Sea and part of the east coast of Africa, &c. This document, which is still extant, was written probably about the close of the second century; but how long this Axumite empire had existed before, we are not able to say. The Greek inscriptions, which was copied by Mr. Salt, shows us that the monarch of Axum had an extensive empire; in Africa, it was co-extensive at least with the present province of Tigre, and his possessions extended even into Arabia. Through the port of Adula on the Red Sea, Axum maintained a commercial intercourse with Arabia and India; and it was probably for some advantage to be secured to Greek merchants from Egypt in the Indian trade, that the Byzantine Caesars paid a yearly tax to the Axumite king until the commencement of the Arab conquest. Axum was the great emporium for ivory, which was exported through Adula. (Periplus; Hudson's Minor Greek Geographers.) It may be mentioned as a curious fact, that when the Emperor Aurelian took Palmwyra in the Syrian desert, he found among the assemblage of nations within its walls some Axumites, probably traders. The Byzantine writers, such as Procopius, Cedrenus, &c., call both the Axumites and the Ha-emertes (Hyemardes) of Arabia Indicae, while they carefully restrict the term Ethiopians to the Axumites. It appears, then, that for a certain period, at least for several centuries after the Christian era, the vague term Ethiopians was used in a limited sense, and applied to a people who inhabited one of the large districts now forming part of the modern Abyssinia. We may conjecture, but we cannot in the absence of all evidence affirm, how the Greek language got to Axum, and how it came to be adopted by the native kings. The most probable hypothesis would be, that as the Greeks gradually got a footing in Egypt, and finally, after the time of Alexander, became masters of the country, as thus restless people spread even into Ethiopia, where some bold adventurers, partly by conquest, partly perhaps by other ways too, became the ruling caste, and formed a dynasty of half Greek sovereigns, whose resemblance to their own nation would gradually fade away, on account of their preas-
mesty to barbarous tribes, and their distance from the centres of 

Abyssinian civilization. 

Axum was probably the first part of Abyssinia into which 

Christianity was introduced. In the *Apology of Athanas- 

ius*, which is addressed to the Emperor Constans Nica- 

esus, *Anastasius of Axum* ("Agenitus") on the subject of 

Frumentius. This letter is addressed jointly to two persons, named Ainasas and Sasanass, without any indication of one being superior 

the other; but they are evidently addressed as the sove- 

regess or regzzarella. The emperor intimated that the imperial decree is as valid in the 

Alexandrine as in the Roman church, and he accordingly 

opened his address back Frumentius to Egypt, in 

order that his appointment and qualifications might be 

examined by Gregory, whom he then held the son of Alexandria, in 

Place of Athanasius who had been ejected, and by the other 

bishops of Egypt. [See *Athenobius*.] In conclusion, the 

emperor addresses the two Axumite princes by the title of 

"most honoured brethren" (*diplikos*). See the 

works of St. Athanasius, by the Benedictines of St. Maur, 

vol. i. pt. 1. p. 315. 

Another sovereign Axum, called Eliebshan, is men- 

tioned by Cosmas, a Greek writer of the sixth century of the 

Christian era. A comparison the inscription of 

Adule, as reported by Cosmas [see *Adule*], shows that the 

inscription of his sword in the one case, and the 

inscription of Axum is posterior to that of 

Adule. In both inscriptions the king calls himself the son of 

Ares, who seems to have been the guardian god of the 

family. In the Adule inscription the king declares he was 

the first of the kings, in the Axumite, he is 

the last to be, as far as we can judge. The 

combination in the Axum inscription simply calls him 

sovereign. It appears from these inscriptions that the 

Axumite dominion extended into Arabia, and comprised 

the Hadramaut, the Arabs, the contemporary of Cosmas, and El Atieba or 

Caleb. But the premises, even if correct, lead to no 

such conclusion. As far as the internal evidence of the 

two inscriptions goes, that of Adule is undoubtedly the older; 

but how far they are reconcilable with the list of Axumite 

kings is another question. 

Mr. Bruce brought from Abyssinia a copy of the *Aby- 

ssian Chronicle, or the Book of Axum*; but this work has 

not yet been translated. It is worthy of remark that the 

"Axumite" stands before El. The name is in fact of several 

sovereigns in the ancient list, though it is long since 

obsolete in the Gezir. [Dr. Murray.] The chronology 

of these Axumite kings is doubtful and much disputed. 

(T. Mar., 1693.) 

AYACU CHO, the name of a plain in Peru, in South 

America, in the district of Guama. It is bounded on the 

east by the abrupt ridge of Condorcanqui, or Con- 

dorkahki, on the west, after a gradual descent of about 

six miles, it abuts upon the main road from Lima to 

Lima; and it is bounded north and south by deep rav- 

ines. Its form is almost a square, about four miles in 

length. This plain was the scene of a desperate conflict 

between the Spanish and the independent Americans in 

December, 1822. This battle was the joy of three months' skilful manoeuvring on both sides; of a suc- 

cession of marches and counter-marches, during which 

several skirmishes took place, the American troops always 

avowedly behind the enemy. 

The royalist army, overcom-maté with fatigue after so long and 

fruitless manoeuvring, were in such a state of discontent, 

that the viceroy always halted by columns, and placed a circle of 

sentinels, of the most trusty men he had, round his camp in 

front of it. The Americans, who seemed to have no 

intention of attacking them, yet always came up to 

snatch them. The royalist army, overcome with fatigue after so long and 

fruitless manoeuvring, were in such a state of discontent,

sentinels, of the most trusty men he had, round his camp in 

front of it. The Americans, who seemed to have no 

intention of attacking them, yet always came up to 

snatch them. The royalist army, overcome with fatigue after so long and
Spainiards under Valdez, drove them back, and followed them across the ravine. The division of La Mar rallied, and, supported by the mounted grenadiers, also crossed the ravine. Colonel Plaza, of the independent army, did the same with his legion on the left, and Lieutenant-Colonel Moreau, with two companies of fusiliers on the right. These two battalions, supported by the cavalry, made two repeated charges so successfully, that Valdez was defeated, and his four field-pieces taken. The Spaniards now began to rally the remains of their army, but the French, by a strong division of horses and Lancers, gained the summits at about 1 p.m.; but at sunset the royalists sued for terms. Centanere rode down to the tent of Sucre, and a capitulation was agreed upon, by which the viceroy, 15 general officers, 16 colonels, 484 other officers, 7540 common soldiers of all ranks, with 2046 horses, 114 guns, and 13 mortars, became prisoners of war. A part of the territory hitherto possessed by Spain in Peru, with the exception of Callao, was also surrendered to the independents. The royalists had 1400 men killed and 700 wounded. The loss on the part of the Americans was 370 killed and 609 wounded. (See Memoirs of General Miller, vol. ii. ch. xlvii. xxv. Annual Register: American Annual Register.)

AYAMONTE, a city in Spain, in the kingdom of Sevilla, 37° 15' N lat. 6° 10' W long. It is situated on the slopes of a high hill, at the point where the river Guadiana enters the ocean. It is a fortified town opposite to Castromarin, in Portugal, the capital of the district which bears its name, and comprises thirty villages. There are in Ayamonte two pleasant public gardens, one of which includes a monstrous house, a bullbaiting-ground, and four hotels. On this last name the article is much esteemed in South America. There are some soap manufactories, a few brick and lime-kilns, and some of common earthware. In the neighbourhood of Ayamonte there are forests of fir-trees, in the heart of the interior. The building of the large fort is not very fertile. It produces on an average eight bushels of corn for one. The castle is of very old construction. The place was conquered by the Moorish king of Granada in 1486. The infant of Antequera wrested it from the hands of the Infidels two years after (1488). See Antequera. (Miliano's Dizionario, vol. iii. x.; and Mariana, lib. ix. e. 16.)

AYEN AKBERRY, properly AYINI-AKBARI, is the title of a geographical and statistical account of the Mogul empire in India during the reign of the emperor Jelheidlin Mohammed Akbar [see AKBAR], written by his vizir Abu'l Fazl. [See ABU' FEL.] It constitutes properly the third or concluding part of the Akbarnamah of the same author, and the first volume consists of a narrative account of Akbar's ancestors, and the second volume comprises the occurrences of his reign, from his accession to the throne down to the 47th year. A free and abridged translation of this work into English was first made by Mr. Browne Willis, and published at Calcutta, in 1793. It has twice been reprinted in England. As an original, and we may say an official account of the internal organization of the Mogul empire at the time of its greatest prosperity, the Ayeni-Akbar is highly interesting. It is divided into four parts: the first three are chiefly political and legislative, containing the regulations of the different household, military, and revenue offices, and showing the manner in which these different departments were administered. The last part is geographical, giving a description of the several provinces at that time comprehended under the Mogul government, and a detailed account of the ancient institutions, religion, and literature of the Hindus, which is very comprehensive and accurate. Everything of a religious nature is here accurately represented, and the whole work is interspersed with a number of tables, many of which are very instructive, and it abounds in notices of general interest, and of great utility for the history and geography of Asia. Among them we shall here only mention the alphabetical account of the provinces, arranged in that order by time different nations of Asia, and a long list of geographical names, arranged according to the Oriental plan of the seven chaupas, and stating the longitude (from the Happy Islands) and latitude of each.

AYLESBURY, a considerable town in Buckinghamshire, on the road from London to Warwick and Birmingham, thirty-eight miles from London, through Watford, Berkhamsted, and Tring, and forty and a half through Uxbridge, Amersham, and Wendover.

This town is situated near the centre of the county, on a small elevated land, the midst of the fertile vale of Aylesbury. It is close to a small rivulet which comes from the neighbourhod of Wendover, and which, after passing Aylesbury, falls into the Thames about two miles north-west of the town. It consists of several streets and lanes irregularly disposed. The town is built on a level, and the vale caused the want of water to be frequently felt by the inhabitants; but the houses are now well supplied by means of machinery in the mill, which is worked by the prisoners. The town is also well paved, and lighted with gas.

Although Aylesbury does not give name to the county, it seems to have the fairest title to be considered as the county town. The quarter-sessions are always held here. Lord Chief Justice Baldwin sat there in council during the time of Henry VIII. But in 1746 Lord Cobham procured an act of parliament for holding the summer assizes at Buckingham; the Lent assizes are however still held at Aylesbury, where also is the county gaol. It is the place that the principal members are nominated and where the return is announced.

The county hall is a handsome brick building, erected in the earlier part of the last century. The old town-hall and market-house, built at the expense of Lord Chief Justice North and erected in 1709, burnt to the ground in 1741. The present building is on the model of the Temple of the Winds at Athens. The parish church, dedicated to St. Mary, is a spacious antient structure, in the shape of a cross, with a low tower rising from the nave and transepts. The town is said to have been raised by that empress Matilda. The churchyard is very large, and has several vaults planted with double rows of trees. There are meandering walks for pedestrians (formerly for freethinkers), Baptists, Quakers, and Methodists.

There is a school, the origin of which does not appear to be clearly known. It was endowed with some tenements by Sir Henry Lee, of Didley, on Oxfordshire, before the year 1687; but the principal endowment is a bequest of 300l. left by Mr. Henry Phillips of London, in 1714, and invested in the purchase of land, which, with the other resources, produces an income of nearly 540l. The school building consists of two houses, one for the head or Latin master, and the other for the writing or English master, with a schoolroom connecting the two. In this school-room 100 boys are taught by the English master, while twenty more are instructed by the Latin master. The school is a classical and mathematical education, in a building adjoining and belonging to the church, supposed to have been originally a charity chapel. There is a charity, denominated, from the name of the founder, Bedford's charity, serving a yearly income of 82l. 13s. 4d. from houses and lands, which income is employed in repairing the roads and about the town, or distributed in money and clothing to the poor. There are five large cottages near the church, occupied by poor people, who are looked after by the person of the name of Hickman, in 1845, together with some other property, the net proceeds of which (about 60l. per annum) are distributed in alms to the poor. There is also a considerable property left by William Harding of Walsingham, in 1525, for the purpose of charity among the poor. An apprentice fee of 20s. is given with each child, and fourteen boys and girls are on an average bound yearly. There are many minor charities. (Regis of Commissariats of Charities, January, 1811.)

The only market in the town is that of beef. There is a market on Saturday, principally for corn, and on fairs in the year, chiefly for the sale of cattle. A market once held on Wednesday has been dismissed.

Aylesbury was made a corporate town and a parliamentary borough by the Act of Queen Elizabeth, in 1563, and consisted of a basti, ten aldermen, and twelve capital burgesses; but the powers of the charter expired (so far as
the corporation was concerned) in a few years after it was granted, in consequence of neglect in filling up the vacancies caused by death; and the right of voting for the members of parliament, which had been at first in the corporation, passed to the inhabitants paying scot and lot. In the early part of the last century, the corporation of Ashby and White, which brought on a serious difference between the two houses of parliament. Ashby claimed to be a voter of Aylesbury, and brought an action at law against White and others, the returning officers, for refusing his vote. He obtained a judgment in the Court of Queen's Bench, in which the case was subsequently brought, gave judgment in favour of the defendants. A writ of error was brought into the House of Lords, who reversed the judgment in the Court of Queen's Bench. The House of Commons claimed the seat, and the case went into the House of Lords, for electing their own members; and on the 23rd January, 1783-4, passed some strong resolutions on the subject, declaring Ashby guilty of a breach of privileges. An attempt on the part of Ashby to follow up the proceedings, and the institution of new legal proceedings against White and his brother officers by other parties, roused the spirit of the Commons, who committed the parties to the new proceedings to Newgate, and their attorney to the custody of the House of Commons, and ordered an open session of the court in the Court of Queen's Bench, but being restrained by that court, they petitioned the queen for a writ of error to bring the last proceeding into the House of Lords. The Commons ordered the persons professionally engaged in the management of the public business to be sent into custody, and their averment that they were taken, but the Lords granted them a protection, and passed resolutions declaring that neither house of parliament could create to themselves any new privilege, one in the business of the House of Commons, and the other in that of the House of Lords. The Commons declared that the Commons had created a new privilege, and had, 'as far as in them lay, subjected the Commons to the custody of the House of Lords, and the House of Commons, to the arbitrary votes of the House of Commons.' They also condemned that House for ensnaring or punishing the professional men, and declared a writ of error to be 'not a writ of grace, but of right.' The House had several conferences, from which appeared to be a decision in the House of Commons to pass a new resolus, and orders passed by the Commons, directing that officer not to make any return of or yield any obedience to the writ of Habeas Corpus on behalf of some of the persons professionally engaged, assuring him of the protection of the House. Ultimately, the proceedings were stopped by the propagation of Parliament. Since this time actions have often been brought against returning-officers, and verdicts obtained: so that the Commons were in effect defeated.

The British names of Aylesbury are numerous and remarkable incidents. In 1644, in consequence of the corruption of the scot and lot voters, the right of voting was extended to the freemen of the Three Hundreds of Aylesbury, conjointly with the inhabitants of the town not receiving alms. (Oldfield's Representation of History of Great Britain.)

The parish of Aylesbury includes the hamlet of Walton, where, as formerly a chapel, the convent forms the endowment of a priorate in the cathedral of Lincoln, within which a manor was held. Aylabury, and the archdeaconry of Buckingham: the vicarage is in the gift of the prebendary. The population of the parish is about 5000, and the area is 2500 acres. Many of the inhabitants of the manor areholders, by the discharge of the scot and lot, and bearing dikes, though the method pursued is by no means expedient to their humanity. They send a considerable number of ducats to the metropolis about Christmas.

Aylesbury is a very ancient town, and is said to have been one of the strongest garrisons of the Britons in their struggle against the Saxons, who took it in 571: from which time its name does not appear in history, till the great civil war in the time of Charles I., when it was garrisoned for the parliament. During the Commonwealth, it was twice taken and twice lost. The Saxons called it Aesypurga (Aylesburg). In Domesday Book, it appears under the name of Elschberie. In Leeland, it is written Alesbury; and in Camden, Aylesbury. In the mode of spelling is retained in the name of Aylesbury, which the family of Brasenhill Bruce takes from this town.

There was a house of Grey Friars at the south end of the town, founded by James Earl of Ormond in 1267; but it was very poor; the revenue, at the suppression of religious houses under Henry VIII., being valued only at 31, 2s. 2d. per annum. It became the seat of Sir J. Bald- win, Lord Chief Justice of the Common Pleas, to whom Henry VIII. granted it, and he sold it to the Park- ington family; but it was so much damaged by the great civil war, that it was never afterwards inhabited by them.

The site of the town of Aylesbury is on the S.W. of Tring. The other boundaries, except on the south side, are rather difficult to ascertain. Leland makes the town extend 'other- ways to Buckingham, to Stony Stratford, to Newport Pagnell, and along from Aylesbury to the Routes of Child, Hilles, and Dunstable. The hills bound the town on the south side, and run in a direction E.N.E. and W.S.W., nearly across the country. They are formed of chalk. The vale is better calculated for grazing land than almost any in the kingdom; but when the agricultural report of this county was drawn up in 1741, the method of farming seems to have been little creditable to the skill and attention of the agriculturists. Grazing and dairy farming seem to be at present the chief objects of attention. The soil consists of chalk, and the gravel and gravel supposes, an easy 'round about (the town of Aylesbury) on every side, are numerous flocks of sheep, loaded with wool, and yielding great profit to their owners. (Lyon's Magna Britanniae; Biographia Britannica; English and Welsh.)

AYLESFORD, a village in Kent, on the right bank of the Medway, a little to the left of the road from London to Maidstone, thirty-two miles and a half from the former, and about three miles and a half from the latter. The church consists of one poor chancel and two poor clerks. There is a stone bridge of six arches over the Medway; and in Ayles- ford-street is a building erected for an almshouse, and endowed by the will of John Sedley, in 1605, for a warden and six poor persons, but the property has been converted to private use, though now, by means of the commissioners for inquiring concerning charities, it is likely to be recovered, and the charity re-established. Ayles- ford has one fair in the year, on the 29th of June. The parish extends on both sides of the river: it contains 3310 acres, and had in 1831 a population of 1301 persons. It includes the hamlet of Milbale, on the left bank of the Medway, and in the civil jurisdiction of the Corporation of Maidstone.

The living is a vicarage in the gift of the Dean and Chapter of Rochester. It is in the deanery and archdeaconry of Rochester. The church was granted by Henry I. to the bishops of Rochester. One of those gave it to the priory of that city; but by one of his successors it was, towards the close of the twelfth century, transferred to the newly founded hospital at Stroud. The monks of Rochester priory appealed to the Pope; and after many years contest, and many decrees and confirmations in favour of each party, it remained with the hospital, and the master of that institution appointing a vicar to celebrate divine service. Just before the dissolution of the religious houses, the master and brethren of the hospital resigned their hospital and all its possessions to the prior and convent of Rochester; and the new vicar, by the dispensation of the dean and chapter, was allowed to receive the revenues of the house: the vicarage into the hands of the king, he granted the advowson of the vicarage to the Dean and Chapter of Rochester, in which it is still vested.

An endowment of 20l. per annum for a charity-school was bequeathed by a Dr. Charles Milner, of Praston Hall, in this parish, who died in 1771.

Close to the Medway, a small distance west of the village, was a Carmelite friary, founded a.d. 1346, by, or under the patronage of, Lord Granville, one of the last of the house of monasteries, the site, precinct, and lands of this were granted to Sir Thomas Wyast, and on the rebellion of his son in the reign of Queen Mary were forfeit to the crown. Queen Elizabeth granted them to the Sedley family, and the present occupants are now in the possession of the daughter of Aylesford. In the mansion of this family, and in the domestic offices, many portions of the friary buildings are still
visible. We take the following description from Hasted's History of Kent.

The greatest part of the ancient priory remains very fair, and by far the least demolished of any conventual edifice in these parts. The great gate from the road is yet entire. It opens to a large square court, in which are seen all the doorways to the cells. The side where the high buttresses and belfries were, was the great hall or refectory, now divided into rooms. The kitchen was likewise on the east side of the square, as appears by the large fire-places in one part of it. The chapel was that part of the building which stands east and west; the north side of which fronts the garden as the south does the river; the east window of it was where now is the dining-room or gallery-door with the iron balcony facing the town. The principal part of this priory, as the hall, chapel, cloisters, &c., was converted into stately apartments by Sir John Banks (who resided here in the latter part of the seventeenth century), and the cloisters were by him inclosed and paved with white and black marble. There is a fair high stone wall which fronts the road and encloses the garden, the same as when in its ancient state. — (Vol. iv. 24 ed. 1796.)

There are in the parish the ruins of the ancient free chapel of Longsole, now used as a barn, and called, from its lonely situation, 'The Hermitage.' It is about two miles from the town, on the other side of the Medway. On the window-frame of a large ancient barn (belonging to Preston Hall in this parish), built of stone, as well as on an outhouse near it, also of stone, and on a chimney-piece, are the letters TC with the date 1162 in Arabic figures. The use of these at that early period has been given rise to much discussion among antiquaries: the inscription is probably of a much later date, and refers not to the date of the erection of the building.

But the most remarkable monument of antiquity is that called Kit's Coty House, situated on the brow of a hill, about a mile N.E. of the village. It is composed of four large stones, of the stone called Kentish rag, according to Grose; while Hasted vaguely describes them as being 'of the same kind.' The following description of this monument is given by Stow in his Chronology, and quoted by Mr. Colebrooke in the Archaeologia, vol. ii. p. 112 (pub. 1773): — 'I have myself, in company with divers worshipful and learned gentlemen, beheld it in anno 1390, and is of four flat stones, one of them standing upright in the middle of two others, inclosing the edge sides of the first, and the fourth laid flat atop the other three, and is of such height that men may stand on either side the middle stone in time of summer, and look from wind to wind. It is being dealt with the breadth of the stones, having one at their backs, one on either side, and the fourth over their heads; and about a foot from this monument lies another great stone, much part thereof in the ground, as fallen down when these others were affixed.' This last extract says Mr. Colebrooke, 'lies about seventy paces to the N.W. in the same field. The thickness is half-burnt; but from its present position, it seems as if it had once stood upright. It has since been buried for the sake of building, and some of their parallel. It may be observed, that the openings formed by the stones of Kit's Coty House are not of equal dimensions, but the larger one incloses and E. and N.E., whereas some writers (as Grose) describe them as forming three sides of a square. The upper stone is not quite parallel to the horizon, but inclines towards the W. or S.W. opening, in an angle of about nine degrees. The dimensions of the stones are as follows. We take them from Grose's Antiquities.

<table>

<td>Upright stone on N. or W. side</td>
<td>8 high, 8 feet, 4 feet wide, 2 feet thick</td>
<td>Estimated weight, 80 tons, 4 feet thick, estimated weight, 80 tons, 4 feet thick</td>
</tr>
</tbody>
</table>

No one has any marks of workmanship.

* Hasted says this stone is near seven feet in height, and rather more in breadth. In the other dimensions and weights he agrees with Grose, from whom it is likely he took them. The measurements given in the Archaeologia are very different.

At the distance of two fields northeastward from Kit's Coty House, in the bottom nearer to Aylesford, is a heap of the like kind of stones, some of which are partly upright, and others lying in a circle round them, in all to the number of nine or ten. Those that are partly upright, with a large stone lying across them, appear to have once formed a kind of structure like that of Kit's Coty House, and to have had the same aspect: the whole heap is now intergrown with elms and other coppy shrubs. This monument of antiquity is supposed to have been demolished by some persons digging a trench beneath it, in hope of finding treasure. (Hasted's History of Kent.) Still nearer to Aylesford is a remarkable stone, called, from its shape, the Coffin. Respecting the origin of Kit's Coty House, as well as of its singular name, different opinions are entertained. It appears that about A.D. 455, soon after the arrival of the Saxons in England, under Hengist and Horsa, when hostilities broke out between them and the Britons, a battle took place at Aylesford, one of the three which are thought to have compelled the Saxons to leave the island for a time. (Turner's History of the Anglo-Saxons, book i. c. 1.) In this battle, Catgern, brother of Guoretum, or Vortimer, the British commander, fell, as also Horsa, one of the Saxon chief-hams. It is commonly supposed that this is the monument of Catgern; and the name, Kit's Coty House, is considered by Stow, Camden, Grose, and others, to be derived from the name of that person. Grose has this passage: 'Perhaps the appellation of Kit's Coty House (so he writes) may be thus illustrated: Kat or K is possibly the familiar abbreviation of Catgern; and in Cornwall, where there are many of these monuments, those stones, whose length and breadth greatly exceed their thickness, are called Kat's stones.' Kit's Coty House may then express Catgern's House built with stones, and must have been a taunting reflection on the memory of that champion for the British liberty, used by the Saxons when in possession of the county of Kent. Mr. Colebrooke inclines to think it is the sepulchral monument of Horsa, which is commonly supposed to be at Horsted, a manor a little to the left of the road from Rochester to Maidstone, about two miles from the former, where are many large stones scattered about the fields, some standing upright, others thrown down. (See Hasted's Hist. of Kent.) The name of Kit's Coty House Mr. Colebrooke supposes to be derived from some old shepherd, who used to keep sheep on this plain, and shelter himself from the weather in this monument. Mr. Pegge (Archaeol. vol. iv. p. 110, et seq.) considers Mr. Colebrooke's hypothesis very doubtful, and regards this and other cromlechs as places of devotion rather than sepulchral monuments. Bede (quoted by Mr. Colebrooke) observes that the place where Horsa was buried retained his name, which he directs to be 'hurceno in orientalibus Canini partibus monumentum habuit suo nomine imaginis.' Now we suppose no one will pretend to say that the name of Horsa is incorporeal in the present title of this monument. The name is variously written: Keith Coty House, by Camden; Cothay House, by Lambard; (Perambulation of Kent, ed. of 1600); Kit's Cotthouse, by Stow; and differently by other writers.
Besides the above engagement, between the Britons
and Saxons, Aylesford deserves notice as the place to which
Edmund Ironside, about the year 1016, pursued the Danes
whom he had defeated at Oxford. Dr. Plot was inclined to
fix the Roman station Vagnia at Aylesford; but he
does not appear to have any followers in this opinion.

The name of this place has been variously written.
The Saxon Chronicle calls it Aeglesaford. According to Nen-
numus (a British historian of the early part of the seventh
century) Aeslafour, Aelisafour, Ailiisafroud, and the Britons
Saxenebrasuil, or Saxeneisagen-Hoel, from the overthrow of
the Saxons here. Asser (in the time of Alfred, who died
about a.d. 900) calls it Aeslafreth; in Domesday Book it
is called Elesford; in a MS. in the hands of Dr. writers Aillesford, and in Leland and
Camden, Aylesford.

The manner of Aylesford was, at the time of the Domesday
Survey, a royal demesne. It was subsequently held by the
Greys of Codnor, the Wyatts, and others.

In common with many of the villages of the
region of the several springs, which change the stones in them, as well as pieces of wood, to
a sombre hue, which becomes deeper when they are taken
out and have become dry. The water flows from a deep
chalky loose soil, is very chilly, and has a rough taste; but
there are no chalybeate qualities belonging to it. (Hasted's
Hist. of Kent.)

AYLSHAM, or AYLESHAM (written in Domesday Book
' Klesham'), a market-town in the hundred of South
Erpingham, in the county of Norfolk, about 11 miles N.
by E. of Norwich, 22 of the same town, 136 of
Norwich, or 118 through East Dereham. It is on the right
or S.W. bank of the river Bure, one of the streams which
unite just above the town of Great Yarmouth. Aylsham
was once noted for the manufacture of building brick, the chief place in
Norfolk for the linen manufacture; and in old records
the 'Aylesham webs' and 'Ailesesham linen,' and the 'fine cloth of
Ailesesham' are frequently mentioned. In the reign of
Henry VIII. the linen manufacture had in a great degree
given way to that of building brick. In front of the market-place
of this town, which was chiefly inhabited by knitters; but this branch of in-
dustry has since decayed, and no particular manufacture
now prevails in the town, unless it be that a few looms are
employed for the Norwich manufacturers. The market, for-
merly small, has been increased; the church tower is
cheesily in corn: there are two fairs in the year. The
river Bure was made navigable for boats of thirteen tons
burden, and drawing two feet four or five inches water in
the years 1773-1779. It had previously been navigable
only to Coltishall, six or seven miles below Aylsham. The
parish is large, containing 4250 acres. The population in
1831 was 2354.

The church, dedicated to St. Michael the Archangel, was
built about the time of Queen Elizabeth. It is in the
parish of St. Edmund, and belongs to the See of
Edwin III. In the fourteenth century, and is in the deco-
rated English style. It has a nave and chancel, with two naves
at each; also two transepts: the north is called St.
Peter's Chapel, and the south the Chapel of the Virgin
Marry. Close to the church pier (that of Aylsham), the
bar at the mouth of the harbour, and the depth of the water
at spring tides is fourteen feet; so that vessels exceeding
200 tons registered burden can be brought over the bar
in safety. There are two light-houses to guide vessels into
the harbour. The dues were valued, in 1551, at

100.

There are two parish kists in Aylsham; the old one stands
at the back of the High-street, on the east side of the town;
and the new one at the head of Catcath-street. The parish
church of St. Michael is in New Town, and stands in front of
the bridge. Besides these places of worship of the establish-
ment, there are Episcopal and Catholic chapels, and
meeting-houses connected with the following bodies of
dissenters: viz., Burghers, Anti-Burghers, Relief
Cam-
bridge, Independents, and Presbyterians. If it is supported by voluntary contributions. The county bridge-
wells is in this town.

The country round Aylsham is the most agreeable in
Norfolk, and when Blomefield wrote his history (towards
the close of the last century) it was much frequented in the
summer season on account of a spa or mineral spring, about
half a mile from the town. (Blomefield's Hist. of Norfolk.)

AYR, a royal burgh on the coast of Scotland, and the
country town of the shire to which it gives name. It is situ-
ated on the south side of the Firth of Clyde, about 77 miles S.W. of Edinburgh, and 34 S.S.W. of
Glasgow. The name Ayr is supposed to be of Celtic origin, and to

have been first given to the river, from which it has been
transferred to the town: the meaning is thin, or shallow.

The principal street (called High-street) is broad, with
two rows of well-built houses. The town is lighted with gas,
and was entirely re-paved something before 1820, so that it is
now one of the cleanest and best-paved burghs in Scot-
land. At the end of the street is the old bridge over the
Ayr, connecting the town with the burgh New Town upon
Ayr, which, though a distinct parish, may be considered as
a separate village. The church of Ayr, or St. Ninian's,
and Content, is included in the boundaries of the present
parliamentary borough of Ayr. A little below this old bridge
is the new bridge, an elegant structure of five arches, which
connects Sandgate-street in Ayr with Main-street in New
Town. At the foot of High-street are the public build-
and Content, are in the boundaries of the present
parliamentary borough of Ayr. A little below this old bridge
is the new bridge, an elegant structure of five arches, which
connects Sandgate-street in Ayr with Main-street in New
Town. At the foot of High-street are the public build-

ings, consisting of an elegant suite of assembly-rooms, and a public reading-room well
supplied with periodicals and newspapers. There is a spire in the centre of the building of feet high, where there is much
admired. These buildings were erected by the corporation at the cost of 10,000£. Near the south end of Sandgate-
street is Wellington-square (the name of which indicates its
modern erection), lying at its western extremity the county buildings, containing court and record rooms,
and other public offices. Behind these is the county jail for
debtors and criminals, erected on the most approved
principles, and in an airy situation near the sea. Wellington-
square is of considerable size. From the houses on the
south side to the church of St. Ninian's, it is about 500
yards long, and the length from the road towards Carrick, into which its
eastern extremity opens, to the court-house on the west, is
about 600 feet. South of it another new square, of much
smaller dimensions, is being formed. A few square yards of the
number of new streets in the same neighbourhood. In High-
street is a new building called Wallace Tower, erected in
the place of an old building bearing the same name, and
said to have been the occasional residence of the Scottish
Prince, the building is a square structure, 50 feet high, ex-
ecuted by Thom, the sculptor of Tam O'Shanter and Souter
Johnnie. Ayr is the residence of persons in easy circum-
stances, professional men, and tradesmen; and the business
which is done arises much from its rank as county town, and
from the residence of the baronet of that name; the benefactors of the town are
the banker, by whose benefactions, besides branches of the Bank
of Scotland and the Union Bank of Glasgow, New Town is
the seat of the coal trade. The different character of the
population of the two places is shown by this, that the
parish of New Town has more than 9000 inhabitants, as
many habitations as Ayr, there are only 40 female ser-

vants, while in Ayr there are 589. Ayr has 166 capitalists,
bankers, professional and other educated men; New Town
over 31.

The harbour is formed by the mouth of the river Ayr;
and from each side of the mouth a pier runs out into the
sea, as far as low-water mark. The length of the south
pier (that of Ayr) is about 1250 feet, and the length of the
north pier (that of New Town) is 1000 feet. The bar at the
mouth of the harbour, and the depth of the water
at spring tides is fourteen feet; so that vessels exceeding
200 tons registered burden can be brought over the bar
in safety. There are two light-houses to guide vessels into
the harbour. The dues were valued, as above, at

100.

Close to the new parochial kirk of Ayr is the academy,
which, from the close of the town's train, has drawn many
families to the town for the education of their children. The
number of scholars averages from 500 to 600 annually: the
harbour is very considerable; but its advantages are
increased by causing an increase of the buildings, and an
improve-
ment in the society. Ayr is a place of gaiety and fashion. It
has a theatre close to Wellington-square; and its races,
which are held on courses about a mile south of the town,
are well attended. On 1st July, when the races are over,
the Silver Cup is

* The measurements are indicated in the text contained in the
boundary reports.
coast to Carick, are a number of villas, chiefly inhabited by persons who are in business in Ayr.

To the west of the town, between it and the shore, stood the fort built by Oliver Cromwell, but demolished at the restoration of the Stuarts. It was defended by six bastions, and two circular paddocks or redoubts, intended for magazines. In its area, of about ten acres, was included the ancient parochial kirk of St. John the Baptist; in which the Scottish Parliament met to confirm the title of Robert Bruce to the throne of Scotland. The town was approached as a fortress, and the garrison of 1000 marks English (666¾ l. 13s. 4d.) to build a new one, viz., that which is mentioned above as "the Old Kirk," built in 1634. The tower of the kirk within the fort still remains, and two of the gates of the town, one leading to the old town, the other to the new town, at the high court of justice for the southern circuit (corresponding to the English assize courts) is held. Sheriff, justice of peace, and burgesses, are also regularly held.

The trade of Ayr, in former times, consisted in a great degree in the importation of wine from France, and the population was then considerable. There was a tradition, that nearly 250 years ago 2000 persons died of the plague. Subsequently the town declined; and in 1754 the population was seen to be in a backward condition at less than 2000; but it must have increased rapidly soon after, as in 1753 it was returned at nearly 3000. At present the trade of Ayr consists chiefly in the export of coal to Ireland, the import of timber, wines from British America, and of iron and hemp from the Baltic. Shipbuilding and fishing are carried on to some extent, the sandbanks of the coast abounding in all sorts of white fish. A considerable woolen manufacture has been lately commenced, to be extensive.

The rise of New Town is more recent than that of Ayr, and has been owing to its collieries, which are now flourishing. The population of the burgh and parish of Ayr in 1831, was 7000; that of New Town, 4000; and the whole town and conventicles, 13,500. There are two weekly markets at Ayr on Tuesday and Friday, and four fairs in the year.

Ayr is said to have been a place of note at the Norman Conquest, and to have been converted into a burgh by William the Lion, king of Scotland, in the year 1292. The corporation consists of a provost, two bailiffs, a dean of guild, a treasurer, and twelve councillors; and has an annual revenue of £200l., and a debt approaching near £20,000. The jurisdiction of the magistrates extends over the whole parish. It is a contributory burgh, returning conjointly with Irvine, Campbelltown, Lively, and Oban (the last three in Argyleshire), one member to parliament.

New Town is a burgh of barony; the burghs or free-mansies, viz., the number to form the council, and each of these what is called a lot or freedom, consisting of four acres of arable land, besides the right of pasturage on the common of 150 acres, which right is enjoyed only by the burghholders. The common revenue of the burgh is small. The common council consists of a provost, two bailiffs, a treasurer, and six councillors are chosen.

The boundaries of the parliamentary borough of Ayr, as fixed in 1742, comprehend the parts of three parishes of Ayr, New Town, and St. Quinva, and contain a population of 14,217.

The coast to the north and south of Ayr is flat; on the east the country rises gradually. The soil of Ayr parish south of that of New Town is very different. There are both in the prebendery of Ayr, and the synod of Ayr and Galloway. New Town was separated from the parishes of Monken and Prestwick, and formed into a separate parish in 1779. In the parish of Ayr (at least, in that of Alloway), which borders on the north of Prestwick, and is one of the most pleasant in Scotland, in 1729. The house stands by the roadside, about two miles from Ayr, and is pointed out to the traveller by a board with an inscription. On a height between the kirks of Alloway and the bridge of Deon, a monument has been erected to the memory of the French stone, in the form of a Greek temple, and contains a portrait of Burns, and some relics connected with him. The scenery in the neighbourhood is delightful in the extreme, which causes it to be much resorted to by strangers.

The parish of Ayr, from its situation, has been much frequented by the Legendary, as a place of refreshment to strangers.

Scots, or Erigena, one of the lights of the dark ages, and the Chevalier Ramsey, are claimed as natives of the parish of Ayr.

There was formerly a monastery of Dominicans, or black friars (the first they had in Scotland), and one of the thirteenth century. A seat of the Virgin Mary was said to have worked many miracles.

(Weber's Topographical Dict. of Scotland; Sinclair's Statistical Account; Playfair's Description of Scotland; and J. Ross's YNYS.)

The town of Ayr is situated on a low hill, extending from its northern extremity about thirty-one miles, and about thirty-five miles from the southern. The distance of the two extremities from one another in a direct line is about sixty miles. Such a line would be in a direction nearly N. by E. and S. by W.

The inland boundary, leaving the northern point of the coast just mentioned, runs in an irregular line towards the S.E., and separates Ayrshire from Renfrewshire and Lanarkshire; after it reaches the most eastern point (which is near the mouth of the river Clyde), it turns S.W. and about twenty-six or twenty-seven miles N. by N. of the town of Ayr), it turns to the S.W. and with many windings reaches the most western point of the coast, which is about thirty-six miles from the point above mentioned. The boundary then runs in a straight line. This last part of the boundary divides this shire from those of Dumfries, Kirkcudbright, and Wigton.

The southern and eastern parts, with a small portion of the northern part, have been the most fertile; and some of the necessaries are of considerable height. Along the shores of the Frith are narrow plains, abounding with gravel; the country inland rises into hills, which, as within an amphitheatre, the best part of the country. The principal hills are as follows:

Blackside-end, in the parish of Sorb, near the river Ayr.

Carleton Hill 1129
K nickowel near Knockdolan 1113
Knocknorman 1113
Ben-erdand, in the southern part of the county
Misty Law, on the border of Renfrew and Ayr
Ails Craig, a rock off the coast
Brown Carrick Hill, a little way south of the town of Ayr.

Ayrshire is a natural basin. Many streams rise near the inland boundary, and flow through the country into the sea, but the shortness of their course prevents them from being of much importance in a commercial point of view. Garnock, rising in the north, and pursuing a course to the south, unites with the Irvine, which comes from the east; or, rather, both these rivers fall into Irvine has so.

The Irvine, which is the larger of the two, is about twenty miles long. The Ayr, which rises in the county at its western part, flows from east to west, and falls into the sea near the town of Ayr. It has a course of from thirty to thirty-five miles. The Lugar is its principal tributary. The Ayr rises from several small lochs on the N.E. border of the county, and passing through Loch Doon, there are but few falls into the sea not far from the mouth of the Ayr, is of about the same length as that river. The Galloway and the Stinchwe may be in the same district as the Doon, as they come from the southern parts of the county. They are about twenty miles long. The river Doon, through the lower Galloway and Stinchwe, takes its rise in Ayrshire or on its border.

There are several small towns near the sources of the Doon, Green, and Stinchwe. Loch Doon, through whose valley the river Doon runs, is about nine miles long according to the Appendix to Sir John Sinclair's General Report.

From Weber's Topographical Dict. of Scot., 1
From the late imported European Report of Scot., and
From the King's Council, presented by the ministers for the Discipline of Scotch Affairs.
Scotland: but by measurement on the Map of Scotland, published by the Society for Diffusing Useful Knowledge, it is not more than about five or six, which agrees with the statement in Chalmers’s ‘Countries.’ The island gives the breadth as three-fourths of a mile. It abounds with fine trout. This fish is common in many of the other streams; but in the river Ayr itself, the quantity has been diminished, partly by the water that comes from the coal and lime mines and lime quarries near the sources of the river.

The Craig of Alls lies in the sea about eight miles from the southern part of the Ayrshire coast. It is not a mere rock, but the summit of a huge sub-marine mountain. It shelters the cove, and is protected by a superlative wall of sand and gravel, except the south-eastern, where the accumulation of the debris has formed a small beach. It is about two miles in circumference, and its summit rises to the height of 1088 feet.

It is covered with verdure, and is the abode of goats and rabbits, grills, auk, and guillemots. It is visited from the N.W., its form is heavy, but when seen from the north it assumes an elegant conical figure. It has on the N.W. perpendicular cliffs 200 to 300 feet high; but on the other side it is dotted with a sea present here and there some rocky faces, but roved generally with grass or wild flowers. It has springs about 200 feet below its summit.

This island is almost entirely composed of one species of rock, known as ‘grit sandstone,’ a white fine-grained, loose, and transparent quartz, the former appearing to predominate. It is mottled by minute and distinct stains of a black colour, which on examination are seen to be small grains of hornblende dispersed through the stone as from a common rock. It is covered by an abundance of coarse vegetation, and of plants peculiar to the other ingredients, a darker or lighter gray tint. The rock is commonly smooth, and breaks into irregular masses: but in several parts, and especially on the N.W. sole, it has a columnar structure. The columns vary in the number of their sides, but are mostly pentagonal or hexagonal, and from six to eight feet in diameter: they are not jointed, but rise continuously to the height of 100 feet. Their fracture is at right angles to their axes, and hence their summits are flat, and afford a habitations for numbers of birds. The columns on the summit of Staf’s and the extensive columns of Staffa; and these possess a requisite which the latter want, the power of catching from their lighter colour the most varied lights and reflections. There is an old ruined castle on the rock. (See an account by Dr. M’Culloch in the Transactions of the Geology Society, vol. ii. No. 18.)

The mineral riches of Ayrshire are considerable. Coal is abundant, especially in the middle and northern parts of the county. Coal measures are found in great coal-field of Scotland. Harbours and railways have been formed to carry the export coal trade. The coal is of different varieties, among which is the blende coal, found in the earth charred, or reduced to the state of a coals. It burns with a brilliant flame that can be felt for 300 yards. Considerable quantities are exported to Ireland and to the West Indies. Cannot coal appears to have been dug formerly, but we are not able to ascertain whether or not it is procured at present. Near Saltcoats eleven different strata of coal have been discovered. The coal of those seams is not all of the same quality. They were discovered by Mr. Cunningham, who sunk shafts, constructed the harbour of Saltcoats, and built salt-pans to consume the otherwise useless part of the coal. The coal is divided into two parts by two dense or natural walls of whinstone.

The county abounds with limestone. Freestone is quarried in great quantity; and there is some whinstone. In Mill and quarried at Kilmarnock, near the northern part of the coast, are in great request for their hardness and durability. They are said to be exported even to the West Indies and America. Near Auchinleck is a quarry of black stone near the number of buildings, or without horns. They are very hard, and grow fat where the large heavy breed of some other counties would be starved. Great numbers are yearly sent to England. The cattle in the northern part of the county is partly of the Dunlop breed, with thick coat and long horns. The finest is the Dunlop, which is considered as having the best a woollen yarn, or a wool, which is carried on. Lead, plumbeous or black lead, antimony, and copper (of each of which the quantity is small) may be considered as nearly completing the list of all the minerals of Ayrshire. (Playfair’s Geographical Description of Scotland; Britain of Scotland.)

There are several mineral springs, but none of them of such repute as to attract many visitors. The soil of this county is thus distributed by Chalmers in his Caledonia:

<table>
<thead>
<tr>
<th>Soil Type</th>
<th>Acres</th>

<tr>
<td>Moss and moor land</td>
<td>285,330</td>
</tr>
<tr>
<td>Total</td>
<td>1,285,650</td>
</tr>
</tbody>
</table>

The light or sandy soil is met with along the coast, interspersed with a large number of waste lands within the eastern boundary the moor lands, intersected with moor roads. Of these moors, Aird’s and Moss Mallock, which last is partly in Lanark and Renfrew shires, may be noted for their extent. In the parish of Murrisk and New Cumnock, which are in the same part of the shire, more than half the land is moss. The clay soil, which constitutes so large a portion of the land, varies in its character: it is, in some parts, strong and productive, while in others it is spongy, wet, and cold; producing grass unfit for fattening cattle, and merely sufficient for keeping alive a breeding stock. (Fullarton’s General View of the Agriculture of the County of Ayr.)

Till about the middle of the last century, the agricultural improvement of Ayrshire was in most respects backward. There was scarcely a practicable road; the farmers’ houses were mere hovels; the lands were overrun with weeds and rushes. The arable farms were small, for the tenants had not stock for larger occupations; the tenure was bad, and the tenant had to pay rent, in a multitude of vexatious servies to the landlord. The land, divided into the croft or infeld, and outfield, was either neglected or worn out by successive crops of oats, as long as they would pay for seed and labour, or by an ill-managed rotation of two or three successions of oats, one of beets, potatoes, and some milk or cheese, constituted the chief of their diet. Even in the town of Ayr, containing from 4000 to 5000 inhabitants, not more than fifty head of cattle were slaughtered annually. A succession of bad seasons, at the end of the seventeenth and beginning of the eighteenth century, obliged hundreds of families to fly for subsistence to the north of Ireland; and the poor were not infrequently obliged to subsist by bleeding their cattle, and mixing the blood with any oatmeal they could procure. (Fullarton’s General View, &c., &c.)

Wheat is not cultivated to any great extent; and though the quality of that which is raised is very good, yet the cultivation of it is attended by many disadvantages. Big or bear is generally preferred to the common barley; but the barley of the Ayrshire coast, chief for its yield, stands pre-eminent, both for quality and produce. Turnips are increasing; potatoes are universally cultivated, and the artificial grasses on all improved farms. Flax also is raised. The best rotation of crops is considered to be oats or beans raised after ploughing up a grass field: after these, in dry soils, turnips or other green crops, such as kale, vetches, tares, or potatoes. In very strong soils, drilled beans, cabbages, and carrots may be substituted in the place of turnips. These are followed by a crop of barley sown with artificial grass seeds. After the clover, wheat or oats, and, in very light lands, rye. (Fullarton’s General View, &c., &c.)

Lime is the most common manure. On the coast, seaweed is much used, and sapers’s waste is in great request with some farmers. (Playfair’s Geographical Description of Scotland.)

The cattle in the southern part of the county are chiefly reared for the market, and are for the most part of the Galloway breed. They are commonly black or brindled (though some are white or dun), and without horns. They are very hardy, and grow fat where the large heavy breed of some other counties would be starved. Great numbers are yearly sent to England. The cattle in the northern part of the county is partly of the Dunlop breed, with thick coat and long horns. The finest is the Dunlop, which is considered as having the best a woollen yarn, or a wool, which is carried on. Lead, plumbeous or black lead, antimony, and copper (of each of which the quantity is small) may be considered as

2 C 2
been introduced at a considerably later period. They are, like the others, excellent milkers. The dairy is an object of great interest, and a considerable quantity of cheese is made. The Dunlop cheese is in good repute; and the making of it forms almost the sole business of the farmers in the parish of Dunlop. Other breeds of cattle are more or less in use among the farmers: they are occasionally introduced to give richness and colour to the milk and butter; the Irish, which are large, wide-horned, and raw-boned, but difficult to fatten; and a small Highland breed, which, having been bred on the hills, imparts that quality to the milk and butter. This milk is very bland, and to any in the flavour of the mead. A proportion of Dutch or Holderness cattle had been propagated in former times, but they seem to have declined; and the attempts made to introduce New Zealand cattle have not yet been successful. But Worcestershire and Leicester cattle appear to have failed. Oxen, it may be observed, are scarcely ever used at plough.

On the dry lands along the coast a small white-faced breed of sheep has long been maintained. They produce but little wool, and that of middling quality, and seem to have very little to recommend them. The native sheep is bred in great numbers on the moors. These are among the hardest, most active, and most restless of the sheep tribe. They are round, firm, and well-shaped, with black faces and horns. They eat barley, oats, soda, and hay teetively, and consume the flesh at five years old is excellent, and the tallow equal to one-fourth of the weight of the carcass. There is a breed at one part of the coast, the wool of which is very fine. The number of sheep in Ayrshire has been stated to exceed that of any other county in Scotland.

This county, with the adjoining one of Lanark, possesses a valuable breed of hardy and strong work-horses, superior perhaps to any in the kingdom. They were supposed to have originated from some Hanoverian or Holstein horses, brought over in the seventeenth century by one of the dukes of Hamilton; but it appears that great pains had been taken, at periods long anterior to that, to improve the Scots and to importations from Denmark, Holland, and Germany. The horses are well adapted for exportation.

Although a prejudice was long entertained against swine, it has for some time been giving way; and a considerable number are now fed upon the refuse of the dairy: but the breeding of them has not been so systematically conducted as in some counties of England. Rabbits are more numerous than in any other county in Scotland. They are bred for their fur; and are killed from the beginning of December to the end of February. Dendrell fowls are reared at almost every farm-house and cottage, and other kinds of poultry are not numerous; neither are pigeons nor bees.

Between two and three centuries ago there were considerable forests in this county. At the time of the Reforma-
tion forestage extended ten miles eastward from the town of Ayr; but this is no longer so. The only forest in the county, excepting Dalrymple wood on the river Doon, belonging to the Marquis of Ailsa, has been entirely destroyed; and nearly a century ago there was little wood in the county, excepting Beech and elms on the banks of the rivers Girvan, Mauchline, Doon, and Ayr. There were clumps of ash and sycamore round most of the farmhouses in the north, and some of those in the midland and southern parts. At present all the lower parts of the country and the banks of its numerous rivers are thickly studded with plantations around the mansions of the proprietors. It is to be regretted that, in the early period of improvement, the Scotch fir was preferred to the larch. Plantations of white yew have been set among the grasslands; and trees have been made with considerable benefit. There is a need for plantations near the lakes in some parts which is excellent for thatching.

The climate of Ayrshire is most, but far from unhealthy. The winter winds blow severally on the coast; and the part near the Islay of Ailsa is not frequented by frequent and heavy showers; the clouds being attracted by the lofty mountains of that island. The air is milder and more temperate than in the east of Scotland; and towards the western or coast side it is pure and free from fogs. Snows meet as they fall on the high ground.

The manufactures of Ayrshire are important, for the distilleries possess considerable advantages. Fuel is abundant; materials for building are at hand; and there are channels of communication open. The vicinity of Glasgow and Paisley seems to have given an impetus to the woollen manufacture. The woollen manufacture has been long established; and

bomests and sargent were early made at Kilmarnock. Impressed machines soon came in, and carpets, cloths (except the finer broad cloths), and stockings have been made. Towards the end of the last century the woollen manufacture was extended to other parts of the county, and is carried on to a considerable extent by the aid of machinery. Dyers and fuller houses have been established themselves in connection with this manufacture. The linen manufacture has also been introduced, though never carried to any great extent. In the village or town of Beith there is a considerable manufacture of thread. The silk manufacture was carried on above fifty years ago but has not been permanent.

The cotton manufacture, having been established in Glasgow and Paisley, soon extended itself into Ayrshire. Great cotton works were erected at the villages of Cattrine on the river Irvine and Causeway on the River Doon, and manufactured nearly all over the county. Bleaching, as connected with the cotton trade, has also been extensively carried on.

Leather is another article of considerable importance. Tanneries have been greatly extended; and the leather is employed in making shoes, boots, and saddlery. Of the latter some is exported to foreign parts. The iron works of Muirkirk have been already noticed. There are foundries in many other places. Pottery for domestic purposes is made, but not to any great amount, such as is much sold to advantage along the shore. It may be remarked here that neither brick nor tile are much used in this county in the erection of houses, the numerous quarries supplying plenty of stone for building, and this being neither so handsome as slate nor so warm as thatch.

Formerly there were no other roads than the pathways which led to church or to market; but now roads have been made in almost every direction in which they are wanted. There is a rail-road nine miles in length from Troon Point on the Frith of Clyde to Kilmarnock, made by the Duke of Portland; and others in different parts of the county, as well as some small canals, either for conveying coal to Saltcoats, the place of export, or transporting minerals to the iron works at Troon. A naval base is projected from Glasgow to Ardrossan; a third part has been executed, viz. from Tradeston opposite Glasgow, past Paisley, to the village of Johnstone: a rail-road has been commenced from Ardrossan to the canal with a view of completing the communication.

The county of Ayr contains the three ancient districts of Carrick, Kyle, and Cunningham. Carrick includes the country to the south of the river Doon; Kyle, the country between the Doon and the Irvine (which is again subdivided into King's Kyle, south of the Ayr, and Kyle-Stewart, north of that river); and Cunningham, the district north of the Irvine. These divisions are marked in many maps, and are used in speaking of the county; but they have had no distinct legal existence, and are not administered by separate judicial jurisdictions. The extent of these different districts and their comparative population are thus given in Sir John Sinclair's General Report of Scotland, Appendix, vol. i.:

<table>
<thead>
<tr>
<th>County</th>
<th>Carrick</th>
<th>Kyle</th>
<th>Cunningham</th>
</tr>
</thead>
<tbody>
<tr>
<td>2,763 sq. miles</td>
<td>380 sq. miles</td>
<td>260 sq. miles</td>
<td></td>
</tr>
</tbody>
</table>

This gives for the whole county 1,036 square miles, or 643,940 acres, which is not far from the statement given by Mr. Chalmers in his Caledonia.

The comparative population, as given by Sinclair, was calculated from returns previous to that of 1801. The proportion calculated from the returns of 1831, which gave 145,100 inhabitants to the county (assuming the calculation of the area given by the Reverend Mr. Cunningham to be correct), is nearly as follows:

<table>

The chief towns in Ayrshire are as follows. In Kyle, Ayr, the shire town, a royal burgh, having in its parish a population of 7,666 persons; and Newtonton upon Ayr, which may be regarded as a suburb of Ayr, with a population of 7,965. In Cunningham parish, there are 7,569 persons in the village of Troon, which has risen to importance from the improvement of its harbour, the rail-road from Kilmarnock, the opening of the extensive quarries, and the flourishing state of the coal trade. In Cunningham is the burgh .

* Playfair's Observations on Scotland from 1666 square miles on the proper local documents.*
of Irvine or Irvine, with a population in the parish of 5200 persons: it is at the mouth of the river Irvine. The large manufacturing town of Kilmarrock (population of the parish 15098); the ports of Saltcoats (population not ascertained), Ardrossan (population of the parish 3194); and Largs (population 2045), which is frequented as a bathing-place, are also in this division of the shire, as well as the inland towns of Stewariston (which has a population of 1600); and Nainstoun in the parish of Loudoun (population 1650). [See Ayrshire, Largs, Kilmarrock, Largs, Saltcoats, and Stewarton.]

In Carrick, the towns of Girvan (population of the parish 64390) and Maybole (population of the parish 5897) have risen in importance of late years, largely due to the influx of operative weavers, chiefly Irish. [See Girvan and Maybole.] Ayr and Irvine have custom-houses.

The county returns one member to Parliament. Ayr and Irvine, with Campbeltown, Inverary, and Oban, in Argyll and Bute, are the three chief towns of the county of Ayr. Irvine is a contributory burg of the Renfrew district.

The population returns and Playfair's Description of Scotland contain a list of forty-six parishes, of which sixteen are in the presbytery of Irvine, twenty-eight in that of Ayr, and two in that of Stranraer, the chief part of the jurisdiction of which is in Wigtownshire, in which Stranraer is situated. Ayr and Irvine presbyteries are in the synod of Ayr and Glasgow: Stranraer is in that of Galloway. There are in Ayrshire several monuments of antiquity. In Girvan is the burial-place of a giant of the olden time, whose stone circle is 230 feet in diameter; and in the parish of Sorn one much larger. At the base it is about 250 feet in circumference, and it rises seven feet above the surface of the ground. The stones, which are also covered with a moss, are covered with gray moss. There is no tradition about the cause of the stones.

In some parishes of the county are oval or circular enclosures, the origin of which has been ascribed, perhaps without foundation, to the Danes. One of these, on the beach near Dunoon, contains, in its interior, concentric embankments of loose stones and earth; the inner one incloses a space of one acre; the outer one a space of ten acres. There is another camp on the same hill about 300 yards off, comprehending about an acre. From these embankments one might suppose that some vestiges of an encampment on a hill called Knockgeor, in the parish of Ardrossan; and on the eastern extremity of the same ridge are the remains of an ancient structure used as an alarm-post. From this post and from Knockgeor signals were made by smoke by day and fire by night.

There are the ruins of several castles and of religious houses, the relics of a somewhat later age than the forego-ers of the castles. Loch Doon Castle, on an island in Loch Doon near Carrick, was built of large blocks of freestone, and no quarry is known to exist within less than eight miles, and the intervening space is rough and mountainous without the vestige of a natural observatory. The coast of Carrick, was the residence of the Earls of Carrick, and the immediate ancestors of Robert Bruce. Being in the occupation of the English, it was stormed by Bruce, and does not appear to have been afterwards inhabited. Little more than the foundations remain: the ruins cover an acre or two ground. Among the other ruined castles are those of Thomastown; Fortencross or Portencross, opposite the island of Little Cumbrae; Dunure, on the Carrick coast; Dean Castle, between Kilmarrock and Stewariston; Ter- renan Castle, between the old Cumbraes and Dundonald (the last a royal castle, where Robert II. of Scotland, the first king of the Stuart line, lived and died), in the parishes so called; Kemplaw, in Dundonald parish, and Isle Bridge Castle, and others in Colmonell parish. The castles of Sorn, or Sornhill, and Knockenher, on the banks of the Girvan; and Greenend, on the coast of Carrick, are still inhabited. Skelmorlie Castle, on the coast, the northern part of the county, and Eglinton Castle, are the residences of the Earl of Eglinton; and Craighead Castle is the manse, or the residence of the minister near the town of the Marquess of Ailsa.

Of the ecclesiastical ruins, the chief are those of the Abbey of Crossraglaw, otherwise Crossrag, Crossragh, Colmorn, Crossam, and Crossatee, in the parish of Kirk Oswald. This abbey is more than any other in the west of Scotland; but as it lies low, and the surrounding country swells into hills on all sides, there is but a confined prospect from it. The walls of the church are almost entire, being about 160 feet long and 22 feet high. The abbey stood in an enclosure of about eight Scotch acres, which was surrounded by a strong stone wall, now almost entire. Kilwinning Abbey, a splendid house, was destroyed about the time of the Reformation. A part of it was used till 1775 as the parish church. At Maybole are the remains of an old collegiate church. The ruined kirk of Kilmaurs lies near Ayr has been immortalised in Burns's 'Ris O Shander.'

Ayrshire was inhabited, at the time of the Roman invasion under Agricola, by the great tribe of the Dammi. At a later period, the place of names and the annexation of the county from Ireland to the peninsula of Cantire, and crossed from thence into Ayrshire, were mingled with the Damni. In the eighth century, Kyle fell into the hands of the Saxons kings of Northumberland. In the ninth century, an attempt was made by Alpin, king of the Scoet-I, to subdue the district, failed. The invaders were defeated and killed. The people of Ayrshire at that time spoke the Gaelic language, and their country formed part of Galloway.

The twelfth century was marked by the introduction of Christianity from England, with its inevitable ecclesiastical and juridical growth; but the change was very gradual, and even at the end of the sixteenth century the Gaelic language was still spoken in Ayrshire. In the middle of the thirteenth century, the Norwegians invaded this part of Scotland; and in 1286 the king of Scotland, Alexander III., defeated them in battle, and was crowned king of the king of Scotland, Alexander III.

The decisive battle took place at Largs in Cunninghame. The seamen of Carrick came soon after, by marriage, into the family of the Bruce, lords of Annandale, and they took possession of Robert's house to the throne, which was carried in the crown.

In the religious troubles which occurred in the time of the later Stuart (Charles II. and James II.), the men of Ayrshire supported the Covenant with much zeal, and suffered severely from their sedition acts. Many which they had embraced: many were put to death, and the highland clans were brought in to live at free quarters among them. They consequently rejoiced in the revolution of 1688, which overthrew the power of their persecutors. In the same year, the moors, mosed, and falled, and there are several monuments to the memory of those who fell in the troubles; especially of the field-preacher Richard Cameron and some of his associates, who were killed after a skirmish with a party of the military in Charles II. time. The character of the people of Ayrshire, with their prudery and timidity, are detectable from the zealotish presbyterians. They are remarkable for their regard for religion, their decency, and good conduct. Burns's Cotter's Saturday Night may be regarded as descriptive of the manners of many of the inhabitants. The life of the people of Ayrshire, and the land they inhabit, in some instances, into irregularities and errors, as was shown by the rise of the prophetess, Mrs. Buchan, towards the close of the last century. Dissenters from the kirk are said to have increased much of late years in the populous towns and villages.

The island of Little Cumbrae, about a mile in length and half a mile in breadth, belongs to Ayrshire. There is in the south part of the island an antient castle, which was surprised and burnt by Cromwell's soldiery. There are also several caves. The loftiest eminence in this island is 750 feet high. The whole island belongs to the Earl of Eglinton. There is a light-house upon it. Great Cumbrae is in Bute-earldom.

* AYUNTAIMIENTO DE SANTIAGO, CONCEJO, CABIDO, REGIMIENTO, and the names given in Spain to the councils of the towns and villages. These councils are in general composed of the corregidor, alcalde, regidores, jurados, and personeros, or hombres-buenos. All these officers, with the exception of the corregidor, was always appointed by the government, were originally elected every year by the inhabitants of the concejo or commune. To be the head of a family, a native of Spain, and settled in the commune, were the only qualifications required either for civil or for military offices. The insinution may be traced to the remotest period of Spanish history. (See Maseo's Historia Critical, vols. iv. to ix.)
more particularly vol. viii. book 2, pp. 22-28.) It existed in the Peninsula under the Romans; and under the Goths it was called the Council of the Proposatius or Villiæ—a political and military governor appointed by the king. The individuals who performed the council were called priores or seniores. In the eleventh and twelfth centuries, the territories where the cruel and devastating wars between the Christians and Moors had deprived of inhabitants were again peopled, and the kings of Leon and Castile made the ayuntamientos familiar. In these new colonies, the many great privileges were bestowed on such as chose to settle in these new colonies. The colonists acknowledged the king as their only lord, and bound themselves by a solemn oath to observe all the laws contained in the feudal code, which had been transmitted from the nobility, viz., neda-Foera, or charter-money. The king likewise bound by an oath to maintain faithfully all the privileges granted in the fuero, not to defraud the concejo or any of its members of their property, and to keep them in protection. Every man in the concejo has a soldier, and was bound to arm himself, and to follow the penion of his alcalde, when legally summoned to the defence of the concejo or of his country. In some of these concejos the king appointed an officer who had the political and military command in the commune, collected the revenues, and watched over the observance of the fuero; but this officer had not either a voice or a vote in the ayuntamiento, and was in every other respect subject to the authority of the concejo. The town council, as it was called, delivered demands of the ayuntamiento to the real or the seniores. The administration of justice, the levying of taxes, raising of troops, and all the interior policy of the concejo, devolved upon the ayuntamiento. The members of this body were chosen every year by ballot, by the inhabitants of the large cities. The smaller concejos had a retired officer for himself or for his friends, or endeavoured to bribe the electors by money, or even by the favour of the king, was thereby deprived of the privilege of ever becoming a member of any ayuntamiento. To supply the expenses of the concejo, it was provided that a fixed portion of public buildings, the endowment of schools, the construction of roads, and other works of public utility or ornament, every concejo possessed certain property, which was inalienable. This fund was increased by the multas imposed on certain criminals by the ayuntamiento. Any individual of good character in the body, or who chanced to be in the service of the concejo, had the right to ask for the fuero of a particular house, and to become a commune; nor was he allowed even to build a castle or a palace by which he might be distinguished from the rest of the citizens. If any one attempted to do so, the alcaide was bound by fuero, and under the menace of death, to prevent him from the execution of his purpose. Every individual who resorted to these cities found in them the most perfect security against oppression; and in some of them, as was the case in Cuenca, he could not be prosecuted for any crime which he might have committed, or even for defaults in paying his tolls, sitting in the concejo: many accordingly withdrew from the tyrannical rule of the feudal lords, and flocked from every quarter to this seat of liberty.

Such were the amenities enjoyed by these colonies and their consequent state of prosperity, that many banias voluntarily enhanced the privileges of their rank to settle in them. Many bechiras, or free cities, which were at liberty to place themselves under the protection of any lord they chose, preferred to be subjected to the power of the king, in order to have the same privileges as the concejos. Similar fueros were also granted to such cities as rendered eminent services in the wars against the Moors. In all ordinary cases the ayuntamientos decided alone, but every subject who could find no justice from the authority of the commune, could appeal particularly in villages, decided in concepo abiertos, or open council, in which all the citizens in the commune have a voice. When the king ordered any thing contra fuero, the same would place the king's order upon his head as a sign of respect, and proceed to act by the well known formulas of "nulla in causa, nullo adjudicetur, i.e., let it be obeyed and not fulfilled. These ayuntamientos had also the privilege of sending their procuradores, or deputies, to the Cortes, or great assemblies of the nation; and these procuradores formed there the Brutos de las Universidades, or the house of commons. This Bruto was always the most powerful auxiliary of the crown, and the most effective check against the pretensions of the barons in the times of feudalism. During the disturbed minorities of Ferdinand IV. and Ferdinand V., the temporary constitution of Spain almost suffered greatly. The kings and the feudal lords, always ready to take every advantage to forward their own interest, and to encroach upon the liberties of the nation, mixed themselves with the present disturbances in the elections of the king, the appointment of the councilors, and in appointing their members in some concejos. The Cortes constantly renounced against this abuse, and several laws were enacted to prevent its continuance. Another innovation introduced by the kings was that of appointing alcaldes for the larger concejos, or city councils, and minister justices in the concejos in the name of the king, thereby depriving the ayuntamientos of the judicial power. Under John II. of Castile, in the fifteenth century, on account of feudalism in its last stage, it was established that the ayuntamiento of that city should be composed of sixteen ropadores—eight for the nobility, and eight for the commons, all appointed by the king, and holding their offices for life. This abuse, says Marana, 'led to another, viz. that of selling these offices, to the great detriment of the common weal, and thus, institutions which are so noble in their origin and tendency are often turned into evil. The nation continuing its remonstrances against this abuse, a law was enacted about 1510 (see Hespana, book viii., c. 12), by which it was forbidden to appoint anyone having a population under 5000 souls (about 10,000 souls) should have an ayuntamiento appointed by the government. Under the prefigurate government of Philip IV., the municipal offices were shamefully sold to the highest bidders in several of the large concejos; and the sale of the offices, for these offices offered little or no inducement, they continued to be elective. Some towns bought the privilege of electing their municipal officers, and were called on that account concejos redimatos, or redeemed councils. Under the prefigurate government, it was provided that two officers named personeros diputados del comun, or members of the comun, should be elected in every town to protect the interest of the people in the ayuntamiento. The Cortes of 1517 abolished all the abuses, and all the towns were restored to their primitive right, selecting their municipal officers. Ferdinand VII., on his return from France in 1814, re-"
Section 2. Flowers covered with numerous glutinous hairs. Stamens much longer than the corolla.

3. Azalea nitida, Pursh. Branches with very few hairs. Leaves small, rather leathery, shining, and smooth on both sides.—Found in deep mossy swamps on the mountains of North America, from the state of New York to Virginia, flowering in June and July. The leaves of this plant, which appear a little earlier than the flowers, are dark-green, shining, and smaller than in any other species; the only parts which are hairy are the mid-rib and the margin. The flowers are white, with a red ting, and glaucous. The tube is a little longer than the filaments; the calyx is very short; the stamens are longer than the corolla. It is doubtful whether this is to be met with in cultivation.

(See No. 1.

4. Azalea heptada, Pursh. Branches clothed with numerous stiff hairs. Leaves long-lanceolate, covered with bloom on both sides, hairy on the upper surface, and smooth on the lower.—A native of the borders of lakes, and on the highest part of the Blue Ridge in the state of Pennsylvania. It is found in upland shrub, growing ten or fifteen feet high, with a bluish aspect, by which it may be recognized at a distance. It is distinguished from A. glauca by its greater stature, its longer stamens, and its very erect mode of growth; also, its glaucous bloom, and the redness of the calyx. In the other species, Pursh says its flowers in a wild state are white with a red border, and a tinge of red in the tube, which makes them appear to be of a rose colour before they are open; and that they frequently have ten stamens.

In cultivation it is often called A. glauca var. candida.

5. Azalea pontica, Linn. Leaves large, not shining, pukered, reflexed and wavy at the edge, green and slightly hairy on both surfaces. Flowers yellow, long-stalked, covered with long hairs and glutinous glaucous.—Common in the Crimea, Caucasus, and the eastern parts of Poland, rendering the whole country a brilliant garden with its golden fragrant flowers, during the month of May. Although found on the mountains, it is by no means an alpine plant, but grows in the hilly regions on the air above the forests. Pursh says its tube is in a fluid nectar, which is said to render poisonous the honey collected by the bees at the time of its blooming. It is readily known by its large yellow corollas from all the American species, in the gardens it is found to a pale straw colour, which is called white by collectors.

Section 3. Flowers with scarcely or glaucous hairs. Stamens much longer than the corolla.

6. Azalea periclymenum, Persoon. (A. auriflorus, Wild.; parericymenum, coccony, coccnea, rubra, rustica, cerasus, alba, papilionaceus, paritia, polyanthera of the Gardens.) Leaves flat, nearly hairless, except the midrib, which is bristly. Tube of the corolla much longer than the limb, which is white.—Found wild in woods of the North Atlantic United States, where it is called Upright Honey-suckle—a name which it well merits for its fragrance and beauty. It is a smaller plant than A. viscosa, rarely exceeding the height of a man, and being generally much shorter, and exceedingly compact, it was formerly distinguished by its yellow flowers appearing before its leaves, whence it was called A. sulphurea; but as this is an uncertain circumstance, the name we have adopted from Persoon deserves the preference. Its leaves are bright green, and nearly smooth on the upper side, flat and thick; veins purple on the under side, and the branches are slightly downy, and their margin covered with stiff hairs. The flowers, which appear in clusters at the ends of the branches, are almost entirely destitute of the glutinous glands of A. viscosa; they have generally more petals than white in their colour, and have remarkably long stamens. Our gardens are filled with variations from this species: it is easily known by its smooth hairy flowers and long stamens from A. viscosa, which is far more sweet; of the varieties the handkerchief is the old one, Azalea viscosa var. Michaux (A. picular, Pursh). Leaves hoary, especially beneath, where they are also downy; their midrib without any stiff hairs. Tube of the corolla of about the length of the limb, which is white.—On barren sandy hills, in the southern States of the United States, on the banks of rivers in South Carolina, and on the mountains of Virginia, this species grows wild; it resembles A. periclymenum.
Azaelea cinerarie. (A. pontica; sinenasi. Botanical Register, plate 1253). Leaves downy on both sides, sharpened, glaucous beneath, reflexed and wavy at the edges. Flowers covered externally only with a fine siliquose: their tube much shorter than the bell-shaped limb, the divisions of which are acute. —Introduced from China by Mr. William Wells, of Redleaf, about the year 1836, and supposed to be a native of that country. Its leaves are very like those of Azaelea pontica, except that they are glaucous underneath, and its flowers are of a bright clear ochry yellow; it is even supposed to be a mere variety of that species. Its bell-shaped corolla, however, without any glandular or other conspicuous hairs on the outside, and with scarcely any tube, distinguishes it so distinctly from it as to be generally distinguished from it.

11. Azaelea indica, Linnaeus. Leaves obovate, flat, green on both sides, and very abundantly clothed with stiffish brown hairs. Flowers quite smooth externally; their tube much shorter than the bell-shaped limb, the divisions of which are rounded. Calyx small and very hispid; stamens five. —This and the following are the most beautiful plants which exist in the rich Florflora of China, where they far exceed in splendour of appearance the camellias, magonias, chrysanthsisms, and roses of the favoured climate. They form a beautiful group of plants in their native state from which they are often transplanted. The branches usually drooping, and covered when young with stiffish brown hairs. The leaves are deep green, flat, and half evergreen, usually tinged with brown, and consequently quite free from the slightest trace of freshness of foliage. The flowers are large and showy, and gaily marked with brilliant colours. The calyx is very small, and closely covered with stiff hairs. Of the many varieties cultivated by the Chinese, the following are the only kinds that have yet arrived in Europe. 1. The Chinese, or the One-sided, with leaves covered with very rusty leaves, and flowers coloured with orange and dusky red —a splendid variety introduced in the year 1819. 2. The Double Purple, with double purple lilac flowers, not very beautiful. 3. The Variegated, with rose-coloured flowers, not very beautiful. 4. The Crimson, and the Indian, occasionally becoming wholly red; the most beautiful kind of all.

12. Azaelea indica, L. H. Bak. Leaves obovate, flat, evergreen, green on both sides, and clothed with brown hairs. Flowers quite smooth externally; their tube much shorter than the bell-shaped limb, the divisions of which are dilated and wavy. Calyx with leafy acute sepals; stamens ten —five of A. amurensis, and five of A. amurensis —greenish, from which it differs in its leafy calyx, evergreen, less rusty, shining leaves, larger flowers, and more numerous stamens. There are two varieties in the gardens, the White and the Royal Purple, or Pyramidal, of which the former is a more noble object when covered with its large blossoms of the richest Tyrian purple.

For Azaelea procumbens, see CHAMELEON.

For A. lappacea and fragrans, see RHODODENDRON.

For the number and beauty of their flowers, the azaleas are among the species of very unequal degrees of beauty, it may be useful to the horticulturist to know that the most remarkable are the following: A. lutea, protoc, scabia, pumila glaucia, nitsa, A. nudiflora rubra, violacea, corvinae (major and minor), stamine, rustica, variabilis, longiflora, cherrina, incarnata, blanda; vittata; marmale; trilobales; grandiflora; vericolor, cobungarii, and papilionacea, gloria mundi; amhornisima; chrysanthea; forsteriana; flowers having a buff tube, and those in, however, far exceeded by that of the Higher Scarlet, or thyrseae (Bot. Reg. t. 1367), a plant which is covered in the spring with low thyrseae of the most brilliant crimson flowers.

The foregoing are the nurserymen’s names by which the varieties may be known, and from which they may be obtained. In the name of Ghent Azaleas, or at Highbee, in Hampshire, by the late Lord Caernarvon. Their parents have been usually some deep-coloured variety of A. pericentralis or A. amurensis. On the other hand, the former giving colour and fragrance, the latter size. Some of the finest of the kind are the following —the variegated pontica or vernicolor, figured in the Botanical Register, plate 1559; the sparkling or scintillans (Bot. Reg. t. 1560); the Black and the White, with large white blossoms bordered with rose and stamened on one petal with yellow; the copper-coloured or aurea (Bot. Reg. t. 1366); and above all, Lady Harriet Stapleton’s (Bot. Reg. t. 1407), with deep rose-coloured flowers having a copper tube, and those of the petals stamened in the centre with a clear buff colour.

The cultivation of azaleas must be divided into that of the hardy and that of the greenhouse kinds. Hardy species succeed in places of ground mixed with about one-third or even one half loam. They should be sheltered when young by one another, or by rhododendrons, which can be cut away as the azaleas advance in size, for they are natives of swampy situations, and require to be kept young, completely protected from the searching sun. The dampness of our climate renders it unnecessary to treat them as swamp plants; on the contrary, they succeed nowhere in England better than on the sides of dry hills or on elevated ground; but it is absolutely indispensable that the soil in which they grow should be screened from the sun, either by their own shadow, or by that of other things. Their roots run along just below the surface of the soil, and never force their way downwards more than a few inches; they are of a delicate texture, and are easily injured. For this reason the best gardeners never allow the soil in which their azaleas grow to be either hoed or raked, it is only hand-weeded, and allowed to become mossy. Every year or two the bed receives a top-dressing of peat and loam, into which the young roots immediately strike from within the old and exhausted soil.

For the greenhouse azaleas a mode of management essentially the same in principle, but different in application, may be required. It is subject to a long period of dry or cold weather, whose vegetation is sometimes torpid; but during the growing season the air is remarkably mild and moist, with brilliant sunshine. The cultivation must adapt its practices to this natural state of things; by growing the young plants, and the young shoots of the old plants, growing, and afterwards allowing them to take a long rest. For this purpose he should commence forcing them gradually at a temperature of 50° or 55° during the month of January, keeping them gently moist; in February he
he was called, and as vegetation becomes more active, moist—re should be more freely applied along with a very small quantity of liquid manure. This mode of treatment must be persevered in, never allowing the temperature to rise above 75° or 80° at the utmost, until the flowers are expanded; after which they happened the plants should still be kept growing until June or July, in which month the discontinue, except at intervals, and they should be allowed to sink to rest, in which state they are to remain till the succeeding January, great care being taken that and be watered with rain or melted snow. The plants are to be set in light, and that as much air as possible is given them.

When about to be again called into existence, they should be shifted into new pots of a larger size than before, and supplied with fresh peat and loam; but in doing this the utmost care must be taken of the roots, in order to better to wash away any soil that it may be necessary to remove, rather than to break it off in the rude manner too usually practised by gardeners who are ignorant of the principles of the operations which they perform. Managed thus, the Chinese azaleas are beyond all comparison the gayest plants that are grown: less stiff and formal than the camellias, equalling in brilliant colours the South American cacti, and infinitely superior to all of them in their graceful forms and graceful manners.

It is wonderful that they should not be more extensively cultivated in this country, where, with their flowering season, visit the garden of the London Horticultural Society, or particularly that of Sir Edmond Antrobus, in Clapham. From these gorgeous plants appear in unrivalled magnificence.

Azaleas are usually propagated by layers; but they may be increased quite as readily, and at less expense, by cuttings of the young half-grown wood, placed under handkerchief, and kept in a glass case, for three weeks, when watering should be discontinued in river—sand. The principal difficulty under this mode of treatment is to preserve them during the first winter after they become plants, as they are apt to damp off; the only remedy is to give them a free ventilation, and constant care to remove those which perish.

AZA'NI, an ancient town of Phrygia, in Asia Minor, now in ruins. Herodians call it Azani, from Azan, the son of Tangitius, and says that some called it also Azanion. The inhabitants were called Azanites, or Azanites. (Stephanus Byzantinus, de Urbibus.) Strabo (xii. 576) mentions Azani, Nacoelea, and Ketysaen (the present Kiolata) as towns of Phrygia Ecipetus. Its situation had been long a matter of doubt, until a few years since, when Mr. Keppel visited the place, when, on examining the ruins at length, he found there that they belonged to the Azani or Azani of the ancient geographers. It is situated twenty miles S.W. of Iolussa, on the banks of the river Rhyndacus, on which are two ancient bridges. A vast quantity of shafts of marble, Martian, and other columns, have been scattered on the ground, and the Turkish village of Tjadvente Histar has been built entirely on the ruins. Rows of erect columns are still standing in several places. The town is in a ruinous state, and remains in an advanced stage of decay. The theatre is 223 feet in diameter; the stone benches and part of the walls still remain. Some of the Greek inscription on the pediment of the temple to the god of Hadranus. Numerous coins of Roman emperors and others have been found in this neighbourhood. (G. Keppel's Journey across the Balkan and into Asia Minor, London, 1831.)

AZAR--DON FELI'Z DE, was born at Barbanules, near Bariastro, or Barbarasto, in Aragon, in May, 1746. He received his early education at Huesca, and afterwards studied at the military academy at Barcelona. In 1764 he entered the army, and served as a lieutenant in the expedition against Algiers, against O'Reilly, in which he was wounded. He was made a captain in 1776. In 1780 he was sent, with the rank of lieutenant-colonel, as one of the commissioners appointed by Spain to define the limits of its possessions in Paraguay, which had been long a matter of dispute between Spain and Portugal. While there, he undertook the task of making a map of Paraguay, a labour which occupied him for thirteen years. He had to explore vast and wild unknown regions, and to be assisted by Indians taught to make maps, and the midst of dangers and privations of every kind. Far from being assisted by the Spanish authorities, he was persecuted by them: even his papers were taken from him, he was accused of having a treasonable understanding with the Portuguese, and was subject to the governor at Assumption, and from the viceroy at Buenos Ayres. Jealousy and ignorance were the origin of these persecutions.

Azar's character, however, stood proof against them, and he rendered some essential services to his government, especially in reconnoitring the coast south of the Rio de la Plata, in the country of the Patagonians. He was recalled to Europe in 1801. He then went to Paris, where his elder brother, Nicolas de Azara, was then ambassador for Spain; and he remained there until his brother's death in January, 1803. Afterwards, Charles IV. king of Spain, called him to Madrid, and appointed him a member of the council for Indian affairs. Azara's travels in South America were written in French and Spanish, and published in 1808, edited by C. A. Walekens, to whom the author had intrusted the revision of the work; with notes by G. Cuvier, an atlas, and a life of Azara, 4 vols. 8vo. They contain a description of Paraguay, and of the various Indian tribes scattered through that vast region of varying and characteristic varieties; with an account of the Spanish discovery and conquest, and of the establishment of the missionary colonies by the Jesuits, and of their singular system of government and instruction. The second part of the work consists of a valuable history of the quadrupeds and reptiles of that country, which had been previously published separately in 2 vols. 8vo. Paris, 1801; it was translated into French from the first ed. of 1790 by M. de St. Mey, 2 vols. 8vo.

AZARA, DON JOSÉ NICOLAS DE, was born at Barbunales, in 1731. He studied at Salamanca, where he distinguished himself so as to attract the attention of Don Ricardo Val, minister of King Ferdinand VI., who offered him a place in the department of foreign affairs, which Azara accepted. In 1760 he was sent to Rome, as agent for the ecclesiastical affairs of Spain. Don José Monino, known afterwards as the Count of Florida Blanca, who was then Spanish ambassador at the court of Venice, appointed Azara his successor. Charles III., was succeeded in the embassy by the Duke Grimaldi, but Azara performed all the real diplomatic business with the papal court. He took an active part in the difficult negotiations concerning the expulsion of the Jesuits from Spain. Azara was gouty, and for this reason was not a good choice for his successor. He enjoyed the full confidence of Pope Pius VI., and had much influence on the Roman politics of that time. Azara was fond of literature and of the arts, and was intimately connected with all the distinguished men who were then in the Roman capital, such as Cardinals de Bernis, Alboni, and Borghi; the archaeologists Winckelmann, Fos, Marini, and Visconti; the artists Canova, Angelica Kaufmann, Mengs, Volpeo, b.c.; and the learned Jesuit Artesgado, Andreas, Clavairo, and Oriol. Azara was especially the friend and patron of Mengs. After the death of that artist, he provided for his family; and he wrote a life of the deceased, which he prefixed to a splendid edition of Mengs's works, made at the printer Bedetti. Azara made a valuable collection of ancient objects, and he was successful in several excavations near Rome. In 1794, when Bonaparte threatened Rome, Azara repaired to his head-quarters in order to avert the storm, and he succeeded in persuading the tribes of the French, though at the price of exorbitant contributions imposed on the Roman state by the conqueror. Azara, after this, felt that his influence with the papal court had declined, and his position became unpleasant. In 1795, when the French government was in Rome, Azara went to Florence. In 1801 he was appointed ambassador for Spain at Paris. He lost his situation through the intrigues of Godoy, the favourite of King Charles IV., and died in 1803, as he was preparing to sail for Italy for some personal studies.

AZAROLE. [See Czatu'gru.]

AZERBIJAN, or AZERBAIJAN, also named AZER-
BAKIAN (Ouseley's Elb Haukal) and ADERBIJAN, is the most western province of the present Persian empire. According to an observation of Sir William Ouseley (Travels, vol. iii. p. 412), Tabriz, the principal town of Azerbijan, was originally called Azerbaiján, from a celebrated fire-worship, Ades a keten, on which not only gave the denomination to the place where it stood, but to the whole province; this name has been altered into Azerbaiján, and by those who affect to write after the Arabian manner, into Azerbijan. (Compare H. de F. Ollendorf, Armenierisches, p. 312; Schlozer, Index to his Vita Salutatis, &c. art. Aserbajisana.) We are inclined to think that the name Azerbaiján, or Azerbijan, is etymologically, the same with Atropatene, under which designation the country was equally known as a province of Media. Strabo, indeed. (lib. xi. c. 13.) would make the name Atropatene, a derivative of Atropates, the name of one of its governors; but this explanation seems unlikely to be correct. Azerbijan is situated between 44° and 49° E. long., and between 37° and 39° N. lat. It is separated in the north from Armenia by the river Araxes, in the east from the table-land of Arag in and Persia by the Kurl-Ozen; towards the south and west it borders on Kurdistan and Taurus. Strabo limits the province, as defined by Strabo (xii. c. 13.): it is situated, he says, towards the east of Armenia and Matiane, towards the west of the Greater Medea, and at the same time towards the north of that of Arzachel, the land extends, on the south of it, to a considerable number of the villages dwelling around the corner of the Hyrcanian or Caspian Sea. (See Grkzad's note to his German translation of Strabo, t. ii. p. 421.) Nearly the whole country consists of a succession of high mountains, separated by numerous depressions, which are partially cultivated and opening into fertile plains. In the very centre of Azerbijan, between Tabriz and Maraghe, are the mountains of Sahand, forming an isolated mass, which rises to the height of 9000 feet above the level of the sea. In a defile in these mountains formed by two large torrents, near the village of Sahand, Colonel Monteith visited and examined a large cave similar to the Grotta del Cane in Italy, and filled with a heavy and noxious gas. Towards the east of Tabriz, and in the vicinity of Arzachel, the mountaineous tract extends over 12,000, or perhaps 15,000 feet. It has the appearance of having been a volcano, though no remains of a crater are now visible. The rocks near the mountains are decidedly volcanic, and all round its base are hot springs. Towards the south-east the high range of the Kafan-Kuh, a branch of the mountains of Kurdistan, follows the course of the Kurl-Ozen, and in common with that river constitutes the boundary of Azerbijan towards the Persian Irak. In the north, Kinneir mentions the black rocks of the Karasog. Towards the east of Tabriz, and near the city, the mountainous tract is also formed in a direction from north to south, nearly parallel to the shores of the Caspian. The famous, though now abandoned, fortress of Shilamad, standing on the summit of an isolated rock, at an elevation of nearly 7000 feet, forms the leading feature of the range.

The principal rivers of Azerbijan are the Araxes and the Kurl-Ozen. [See Araxes.] The Kurl-Ozen, the Amur of Polomar, and, according to Krennelt, the Gowan of Scipione (J. Kinko and Scipione, Geographia di Herodot., 12 ed., vol. 1. p. 519), rises to nearly a height of 9000 feet above sea-level in Kurdistan, eight or nine miles from the town of Sennine or Sennah. It is during part of the year only a shallow and narrow river; but from April to July the melting of the snow causes it to swell to a volume all day long, and horses and camels are established. It runs at first in a northern direction, along the coast of the Kafan-Kuh, till it approaches the town of Miannah: here it is met by the Garangoo or Karankoo (a river which has its source in the Sahaneh mountains eastward from the town of Miannah, divides its course, and flows to the Caspian,) forcing its way through a frightful chasm in the Elbrus mountains. It is there joined by the Shaliord, a river formed by two streams, the one (the Abbar, Elbaker, or Eschager) rising in the Elbrus mountains near Tabriz, and the other, called the river Sardar, from the vicinity of Kazwin. Having reached the lower country of Ghilan, the collective water of these rivers, under the designation of Lepard and Sardar-rud, or the White river (so named from its rapids and foaming appearance), forms a rapid and navigable course to the Caspian Sea, which it reaches near the town of Miannah. The road from Ghilan to Hamadan leads through the defile of Rudbar along the side of the chain through which the Kurl-Ozen descends to the low country, and is described by travellers as surrounded with grand and terrific scenery. (See the view of a bridge over the Kurl-Ozen in Malcolm's History of Persia, vol. i. p. 324.) Another pass over the Ghilan mountains, that of Moulla, leads through twenty miles of a difficult rugged defile, which Colonel Monteith describes as being infinitely stronger than that of Rudbar. That from Astara over the Talish mountains to Ardabil is also exceedingly steep and stony. Another pass over the mountains to the east of the Araxes is that of the Arvand, after which town, Rudbar: it leads along the Arvand river, which now forms the boundary between the Russian and Persian territories. Besides these two principal rivers of Azerbijan, we may mention the river Motan, which flows into the Caspian from within the N.W. and falls into the lake of Urmiah; the Yezid rather in the mountains between the lakes of Urmiah and Van, and joins the Araxes; the Adar, which fertilizes the plain around Tabriz, and the Sar, which waters the country around the town of Ghiilan, falls into the lake of that name; and the Karas Sea, or Derra Yurd, which rises in the Severian mountains near Ardabil, and falls into the Araxes.

The lake of Urmiah teemedformerly with fish. [See Araxes.] The rivers thence are those that constitute one of the most remarkable features in the physical character of Azerbijan. Strabo (xii. c. 12, t. ii. p. 458) says that in the time of the Sauata; that is, perhaps, the time when the saltness rises to the surface and crystallizes; they cause an itching sensation and gripes, against which oil is a remedy; if garments are washed in the water of the lake, they are found to be obviated by dipping them into sweet water. Elno Haukal also was aware of this peculiarity of the lake; its water, he says, is salt and bitter, and contains not any living creature. All round this lake are villages and hamlets, and the land around is a rich farming country. The lake, which is divided into two bars, the Katsando and the Kortsang, to Armî (Urmiah) two farsangs. The length of this lake is five days' journey by land, and by water, with a fair wind, a person may traverse it in the space of one night. [See Araxes.] The word farsang, see note 4.考查得 bets that the water of the lake of Urmiah is more salt than sea water, but remarks, at the same time, that it is perfectly clear. The same traveller estimates the circumference of the lake at 50 farsangs or 300 miles. It contains several islands or islets of considerable size, which are considered as a treasury by the celebrated Tatar conqueror Ulukul.

The climate of Azerbijan is described as healthy. The best during summer is considerable; the atmosphere is even during winter, generally very clear, but the days are intense, and the wind is very powerful. In the evening almost entire want of fuel, dried cow dung mixed with straw being the only substitute. Nevertheless, few of the inhabitants of either sex put on and retain any clothing when the cold season lasts, but Sir Robert Ker Porter observes that the women of Tabriz severely cover themselves with mantles without which two persons being found frozen to death in the next town, the tops of the higher mountains are covered with snow during nine months of the year. Colonel Monteith reports that in the town of Tabriz, which is situated on a plain, he was told by a person who had spent many years there, which time he spent there the thermometer never attained the freezing point, and at night it always froze: the greatest cold was 4 Fahrenheit. The same traveller observes, that near Lowor, a village situated on the Bross or river, in an elevated part of the mountains, the lake takes its rise, and is larger than the Caspian.

Colonel Monteith saw grapes cultivated in the perennially frozen lake's edges.
of a Persian prince; and at Kullat, in the same neighborhood, he found walnut and plane trees of gigantic height. Violent hail-storms are common. The soil of Azerbaijani, where it is cultivated, is very productive; the best yields from fifty to sixtyfold. It is fertilized chiefly by artificial irrigation. The plough is drawn by oxen. Travellers notice the cheapness of provisions, and the pleasing appearance of the gardens and orchards, which abound in delicious fruits.

In the Koołabooz mountains, which form part of the Kafqaz-Kuh, are iron, copper, and lead mines: "a treasure of riches, observes Sir Robert Ker Porter, which, if properly worked, would drain the country," is a monastic establishment (Travels, i. 268). In the same neighborhood salt-mines are noticed by Colonel Montet.

The most flourishing part of Azeri is that along the northern and western border of the lake of Urmiah, from Tabriz to the confines of Armenia. Here we find the towns of Shebester (or Shebaster), Tavou, Shar, Selim, Khoi, and Urmiah; the three last were already known to Abulfeda (see Schultens' index to his Vita Saladinii, &c., ed. Aserbejyanii), who fixes their geographical position. Selim, or Selmas, is now a town of about 2000 inhabitants, most of whom are Nestorian Christians. Khoi is described by Kinner as one of the finest and best-built towns of Persia: its walls are in good repair, the streets are regular, shaded with trees, and the doors of the houses are tastefully painted. The town of Urmiah, the supposed birth-place of Zoroaster (see Anquetil Duperron, Zoroaster, i. part ii. p. 5), is situated on the S.W. side of the lake to which it gives its name; its population is estimated at about 40,000 souls.

Maragha, a town of about 15,000 inhabitants, is situated in a low valley, at the extremity of a well-cultivated plain opening to the lake, from the east side of which Maragha is distant eight or nine miles. The place is famous in Oriental geography for the observatory that the astronomers Na'sir-eddîn (born a.d. 1200, died 1273), erected under the auspices of Nâjur, who, after putting an end to the caliphate of the Abbasides, fixed his residence at Maragha. The observatory is still standing, on a hill near Maragha; and close by, on the western brow of the hill, there is a curious excavation, forty-one feet in length and sixteen in breadth, and similar in many respects to the caves of Elephanta and Salsette, in India.

Of the time when it was made, as well as of the purpose for which it was intended, we are utterly ignorant.

The principal town of Azerbaijan is Tabriz—(situated, according to Browne, in 39° 4' lat. 45° 35' long.; see Ker Porter's Travels, i. 232; according to a number of observers, in 39° 2' lat. 46° 2' long.; see Journal of the Royal Geographical Society, in 57). The number of its inhabitants is at present about 30,000; but the extent of its ruins, which towards the east continue to a distance of three miles beyond the actual circumference of the town, shows that the place was formerly much more populous. Chardin, in 1658, estimated its population at 900,000 souls, which is perhaps exaggerated.

It's situation, near the confines of the Persian and Turkish dominions, sufficiently accounts for its present desolate condition, as the town has been subject to frequent conquests and devastations. It has, moreover, repeatedly and most severely suffered from earthquakes: in that of 1772, 70,000 persons are said to have perished; and in a subsequent one, 40,000. An earthquake occurred in 1668, when Sir Robert Ker Porter was there, in March, 1678. Whether, according to a prevailing tradition, Tabriz was founded by Zobaidah, the wife of Harun al-Rashid, remains doubtful, although it is certain that it was a favourite residence of the caliph. D'Anville and Sir William Ouseley (Travels, iii. 410) appear inclined to attribute much greater antiquity to Tabriz, by supposing it to be identical with the town of Oubris (or Tabris), mentioned twice by Pausanias (Perseis, c. 2), though with different degrees of latitude and longitude.

Miannah (also called Mianeh or Miane) is situated in a long and winding valley on the western side of the Kafqaz-Kuh. It was nearly ruined by the Russians in their late invasion of Persia, and seems to have been infested by a poisonous insect, named milheh, the sting of which is described as very dangerous. The road from Miannah to Tabriz leads over an extensive plain, called the plain of Aujan. In this plain, about six miles west of the village of Timmedzah, there is an eminence, where, on both sides of the road, are many large and upright bewn stones, arranged in lines; one row, on the right hand (coming from Miannah), appeared to Sir William Ouseley to have formed part of a circle now imperfect. These stones had already been observed by Chardin (t. iii. p. 13. Rouen edition of 1723: Mannert (vol. v. part ii. p. 162) is inclined to consider them as marking the situation of the ancient town of Gaiz, Gaize, or Gazan.

The ruins now called Kialah Zobak (i.e. the castle of Zobak, a tyrant celebrated in the early fabulous history of Persia), situated on a precipitous rock near the river Kafqaz, are supposed by Colonel Murzefeh to be the remains of the ancient Atrepatana. Near Lyula, in a fertile plain irrigated by the river Jagatty, the same traveller saw the ruins of a large town, about fourteen miles in circumference, which he, differing from Mannert, is inclined to consider as the ancient Gaze; and on the top of a steep and rugged mountain, near the valley of the Shahrud (the southern branch of the Kizil-Orein), he visited the remains of the residence of the chief of the Assassins, or Old Man of the Mountains.

The town of Ardishik has already been briefly noticed in a separate article. It is situated at the eastern descent of the high Sereil mountain range. Towards the north of the town there is a fertile plain with excellent pastures, but deserted, it is said, by a dangerous species of snake. It spreads as far as the mouth of the Araxes, to an extent of sixty furlongs in length and twenty in width. It is named Choval Mogam—in the plain of Mogam.

The mountainous country to the west of Urmiah and Selmas is inhabited by a race of Christians of a singularly savage and ferocious character. They are said to be the remains of the numerous Christian population which inhabited this province in the times of the Greek emperors, who retired into these mountains from the persecution of the Mohammedan conquerors. Of their institution we know little, for they live exclusively among themselves, and allow no stranger to enter their territory. They consist of four tribes, and are under the rule of a prelate, whose dignity is hereditary; and in the choice of the chief himself no law is allowed to interfere. The marriage of the chief himself is not allowed to marry. The family name of the present prelate is Marachmiin. He keeps up a sort of alliance with one Mustapha Khan Hukurao, a Kurdish chief, but owns no allegiance, either to the King of Persia, or to any other of the surrounding powers.

AZIMUTH, a corrupted Arabic word, which, when properly written is az-sam, the as being the article of, assimilated to the initial letter of the word to which it is prefixed; az-sam means 'a way, a road, a path;' also 'a part, tract, country or quarter.'

Azimuth denotes the angular distance of the horizontal point which is directly under a star from the north point of the horizon. Thus if S be the spectator, Z his zenith, Z N his meridian, N A the horizon, and Z A the vertical circle passing through a star *, then the angle A S N is his azimuth of the star, as measured in the angle made by the vertical circle Z A and the meridian Z N.

The only instruments in use by which the azimuth could be immediately observed are the theodolite and the altitude and the initial letter of the word to which it is known, the azimuth can be found by observing the altitude A* and solving a spherical triangle; for in the triangle whose
sides are the complements of the star’s altitude, the star’s declination, and the latitude of the place, the azimuth is the angle which is the complement of the declination, as may be seen in the triangle ZP ZP’, where ZP is the pole. Similarly the latitude of the place may be found when the altitude and azimuth of a known star are observed at the same moment. For in the triangle just mentioned, ZP and ZP’ are given, and the angle Z P; whence ZP may be calculated. When the azimuth of a star is found by means of an instrument adjusted by the magnetic needle, then the azimuth obtained (which needs a correction on account of the deviation of the needle from the meridian) termed the corrected azimuth. In this way the deviation of the needle may be found at any known place by observing the magnetic azimuth and calculating the true azimuth by observing the altitude of a star in the manner here described.

An instrument is said to be moved in azimuth when it is turned on a vertical axis, so that any line in it drawn through the axis points to the same altitude in the heavens, but not to the same azimuth. Similarly an instrument is moved in altitude when it is turned on a horizontal axis. An altitude and azimuth instrument is one which admits of both motions.

It is hardly necessary to observe that when the star is in the horizon, and when the azimuth is less than 90°, the [first] (or first) amplitude (which see); and when the azimuth is greater than 90°, (azimuth - 90°) is the amplitude.

An azimuth circle is a circle all the points of which have the same azimuth, a vertical circle. For azimuth COMPASS, azimuth DIAM, see those words.

AZINCOURT. [See AZINCOURT.]

AZINEPHORA, in entomology, a genus of the order lepidoptera and family geometridae. See 

AZOR, or AzoR, is commonly considered as a part of the Black Sea, but being a close sea, united to the Black Sea by a narrow strait of considerable length, and differing from it in many peculiar features, it is rather to be considered as an independent piece of water. There are several thousand shores of the Peninsula of Crimea in an east-north-east direction to the embouchure of the river Don. If the outlet of the Don, and the most western creek formed by the Pantid Sea, near Perekop, on the Isthmus of Crimea, are considered as its two extremities, it extends from west to east over 5° 30' long, from 33° 46' to 39° East of Greenwich. Its whole length, therefore, is upwards of 200 miles. From south to north it extends about 2° of lat., from 45° 20' to 47° 20', but its breadth varies in proportion to the number of islands and islets which lie in the long bay, which may be called the bay of Taganrog: it extends in length from the mouth of the Don to the low and sandy Capes Dolgava and Bolosorskaya, about 70 or 80 miles, with an average breadth of scarcely fifteen. The sandy shores of Taganrog and the bay, may extend to somewhat more than 100 miles from east to west, with an average breadth of 80 miles from north to south. This sea covers a surface of upwards of 14,000 square miles, and is more than half of Ireland, and double the Lake of Lagos, in area.

The Russians call it More Asovskoe (the Sea of Asof); among the Romans it was known by the name of Palus Mneta, or Maida, that is, the Lake Maida. This name is more appropriate than that of sea, for this sheet of water is a lake, and a shallow lake too. In the centre of the main body, where the depth is greatest, in the main basin, there are three, and but three, where an average only between six and seven; and this depth extends to the Strait of Yenikal, by which it is united with the Black Sea. Towards all the other shores, its depth decreases to five fathoms, and even four and a half. The Bay of Taganrog is much shallower: at the mouth of the Don, and is easily partitioned into two long bays, which may be called the bay of Taganrog: it extends in length from the mouth of the Don to the low and sandy Capes Dolgava and Bolosorskaya, about 70 or 80 miles, with an average breadth of scarcely fifteen. The sandy shores of Taganrog and the bay, may extend to somewhat more than 100 miles from east to west, with an average breadth of 80 miles from north to south. This sea covers a surface of upwards of 14,000 square miles, and is more than half of Ireland, and double the Lake of Lagos, in area.

low strip the higher shores rise from 38 to 40 feet, and are composed of calcareous and marly strata. Sometimes they advance close upon the sea, as in the case of the cliffs on which the towns of Taganrog and Azof stand. The coast from the south of Dolgvra to the Strait of Yenikale exhibits a different character. Though the interior of the country presents the same monotonous aspect as the other steppes, the low shores are here much broader, and extend some miles into the interior. They have not a sandy soil, but are marshy, and sometimes a part of them is covered by the water of the sea. But as the bottom of the sea along this marshy tract is swampy, it is very productive in fish, and the whole coast is lined with the huts of the fishermen. In this low, marshy country pelicans in great numbers were observed by Bishop Heber.

The two peninsulas which, projecting respectively from the European and Asiatic continents, form the Strait of Yenikale, have some peculiarities: that to the east of the strait is a part of the island of Taman [see KUBAN], and consists of small strips of low land, which separate several salt-lakes of considerable extent from one another; these salt-lakes occupy the greater part of its surface. The peninsula to the west of the strait, which is now called the Peninsula of Kartch, from the town of that name, and once formed a part of the Greek Taurica Chersoneseus, exhibits, at some distance from the shore, a range of high land, which rises to 300 feet and more above the sea. These salt-lakes it likewise has salt-lakes. On both peninsulas numerous springs of petroleum are found, to which Pallas attributes the mud volcanoes which exist here.

The uninhabited shores of the Swas are low, and the land along the coast forms a dreary plain. No considerable place is situated on the shores of the Sea of Azof, except Taganrog. On the Strait of Yenikale stands the town of Kartch, which is considered having been the residence of the great Mithridates of Pontus in the latter unhappy part of his life. [See KARTCH.] (Pallas; Captain Joose; Rennell’s Atlas of Western Asia; Strabo, Cassub. p. 308, &c.)

AZOF, or AZOV, called by the Turks Asak, a town of southern Russia, and once a fortress of great celebrity, gives its name to the adjacent gulf of the Black Sea: it is situated on an eminence, washed by one of the principal arms of the Don, at a distance of 20 miles from its mouth, and 360 miles to the south-east of Ekaterinoslav, the capital of the Russian province which it belongs. In ancient times it was known to the Greeks under the name of Tanais; and in the twelfth century was under the dominion of the Poloufian princes, from whom it was wrested by the Genoese in the thirteenth century: the Genoese, who called it Tana, were driven out of it by Timur-leng, in 1392. Azof and its domain fell into the possession of the khans of the Crimea; and eighty years afterwards were reduced by the Ottomans. The obstinate contests for this important post, which took place between the Turks and Russians in the seventeenth and eighteenth centuries, terminated in its cession to the Russians in the year 1774. It has now lost all traces of its former importance: the town is become a cluster of filthy, miserable cabins, its fortifications are gone to decay, the branch of the river is choked with sand, and its once busy port has sunk into a deserted haven. The only attraction which it possesses at the present day is a fine and extensive prospect of the surrounding country, as far as the opposite coast of Taganrog, and the prominent point of the Chumberskaja foreland on the Asiatic shore.

Strabo (p. 493) says, that Tanaus was a colony of Greeks from the neighboring Bosphorus: it was ruined by Polemon before the time of the Greek geographer. Strabo also describes it as being at one time the common market of the European and Asiatic Nomadic tribes of this part of the world: the barbarians gave slaves and skins in exchange for articles of dress, wine, and other commodities, the products of civilization.

AZORES, or WESTERN ISLANDS, are situated in the North Atlantic, about 793 miles from the west coast of Portugal. They consist of nine islands in three distinct groups, lying in the direction of W.N.W. and E.S.E., and extending about 330 miles. The north-western group comprises the small islands of Corvo and Flores, distant about 114 miles from the central group, which includes Terceira, St. George, Pico, Fayal, and Graciosa. The third group, 69 miles to the S.E. of the second, is composed of the two islands of St. Michael and St. Mary, and the Formigas Rocks. Doubt still exists with regard to a small island seen by Pimento, the Portuguese navigator, who calls it Topo: it is supposed to be about four miles north of the S.E. point of St. George (Ponte de Topo), and to be about seven or eight miles in circumference. This island is not laid down in our present charts, but is said to have been seen by an English ship of late years.

The Azores have sometimes been called the Terreiras, from the name of that island: by some geographers they have been classed among the African islands, though there

can be no doubt that they belong more properly to Europe, from their latitude and proximity to that continent.

The history of these islands is obscure, and the exact date of their discovery uncertain: they appear, however, to have been discovered about the middle of the fifteenth century (Behm says in 1411) by Joshua Vanderberg of Bruges, who in a voyage to Lisbon was driven thus far to the westward by stress of weather. Boasting of his discovery on his arrival at Lisbon, the Portuguese government immediately fitted out an expedition and took pos-
English feet. The sides of this mountain produce the finest
wines, which, though inferior to Madeira, being much
cheaper, find a good market both in Europe and America.

On approaching the island the aspect is imposing from
the barren appearance of the mountains and the deep
rocky coasts, which nearly everywhere present high and
craggy cliffs; but a nearer view exhibits a most luxuriant
landscape of vineyards and corn-fields, interspersed with
orange and lemon orchards, and open pastures bounded by
woods.

St. Michael is the largest island, and the residence of the
bishop; but Angra, in Terceira, is considered the capital
of the group, and the seat of the civil government. Terceira
itself is one of the least fertile, and is often supplied from
the neighbouring islands; from the nature of its coasts
it may be deemed almost impregnable, every accessible
point being defended by batteries.

Among the Azores there is not one good port for
vessels of burden, all the anchorage being in open bays or
roads, from which ships are often obliged to put to sea at
a very short notice. The channels among the islands are
clear and deep, but strong currents set through them, and
the Florida or Gulf Stream is at times sensibly felt here.

From the nature of the land, vessels are subject to sudden
calms, squalls, and eddy winds by approaching too close to
the shore.

The trade of the Azores was formerly a monopoly of Portu-
gal, but it has been opened to other countries, whence
woollens, hardware, boards, stores, pitch, tar, iron,

c., are imported; in return for which wine and fruit are
the chief payments. From the mother country the pay-
ment of its imports consisted principally in domestic
indulgences, images of saints, sacred relics, &c.

The climate is mild and pure. A residence in these
islands has often been recommended to those afflicted with
pulmonary complaints, as they have a more equable tem-
perature than the northern parts of Portugal. In winter, the
weather is attended with heavy storms, is not severe, nor are the
bouts of summer oppressive, surrounded as these islands are by
an expanse of ocean. The Portuguese settlers natur-
ally introduced their own religion, manners, and customs,
which their almost undisturbed possession, and the

cult of the country to that of their own countries, have con-
tributed to maintain. Regularly built towns, handsome
churches, large convents and monasteries, and the
preva-

lence of white washing their buildings, are the same fea-

tures as are found in Portugal. The population of the
islands is computed to be under 200,000 souls.

Among the Azores the rise of tide varies from 4 to 7
feet, but it is much affected by the previous winds. The

coast is the westward.

About sixteen miles to the N.E. of St. Mary are seven
eight small rocks, occupying a space of nearly a mile; they
are called the Formigas, or Anils, the highest of them
is about forty feet above the sea, and they rise so abrupt-

ly, that within thirty yards of them there is no bottom with
fifty fathoms. Another patch of rocks, of about the
same extent, but only just above the water's edge, lies some
or two miles to the N.E. of the Formigas, called Tuleira’s Reefs.

The geographical position of the group is included be-

teen the parallels of 39° 37' and 39° 45' N. lat., and the
meridians of 28° 35' and 31° 15' W. long. The several
islands will be described under their separate names.

A ZOT, or AZOTHIC GAS, from a prevalent and in-
digeous destructive life, is frequently caused

D zgizted by Google
With hydrogen it constitutes the alkaline ammonia, already described; with chlorine and iodine it gives rise to dioxideinating compounds; with carbon it forms cyanogen, and with phosphorus is only to be regarded as a mixture of two chemical compounds, or with any of the metals. It enters into the composition of most animal matter except fat and bone; and though not a constituent of the vegetable acids, it forms a part of most of the vegetable substances.

Azoite by itself is fatal to animals, yet it is a most important constituent of the air, as serving to moderate the action of oxygen during combustion, and the too great excitement which that gas required unmixed would produce in the animal system. It is also said also by Majendie that animals will not live on food that contains no azote.

Although azote has not been decomposed, it is strongly suspected to be a compound body; and various facts have been cited in support of this opinion: thus, when mercury is negatively electrified in a solution of ammonium, the metal increases in volume and becomes a soft solid, which was supposed by Davy to be derived from the formation of an amalgam between the mercury and a metal furnished by the azote of the decomposed ammonium; when, however, this amalgam is no longer under electrical influence, it decomposes, hydrogen, ammonia, and mercury being produced. Davy further imagined that these changes were connected with the appearance of the azote of lime, which reproduced azote by combining with the supposed metal, and that one portion of the hydrogyned formed ammmonia by uniting with the azote, while the remainder was evolved in the gas, but this, as shown by Lusacc and theandar, these effects are produced even when water is not present, and they consider the azote as a compound of mercury, azote and hydrogen, the last element being combined with less azote than in ammonia. Professor H. 3. Auchmuty has examined the phenomena of the action of azote on substances, and the formation of that element of which he supposes to be the production of an adhesive attraction to the particles of the metal by the electrical action, by which the particles of liquid and aérom the bodies are entangled and retained, a kind of frawty compound being formed, and the fluidity of the fluid increased by the azote so united. (Lee vol. xxx. p. 12.) Buresius also supposes that azote is a compound; and although his views on the subject are extremely ingenious, they cannot be considered as conclusive: Davy attempted, but in vain, its decomposition by means of the action of potassium and the voltaic battery.

The following experiment, related among others by Mr. Faraday, is strongly in favour of the compound nature of azote, although the author confesses that he is not able to explain it. An electric current was passed between hydrogen gas and zinc foil and a piece of hydrate of potash were put into it. It is evident that the only elements present were zinc and potassium; with oxygen and hydrogen, forming the hydrogyned lime, the hydrogyned water, and the application of heat ammonium was evolved, as indicated by its action on moistened turmeric paper, placed in the upper part of the tube. In this experiment, then, ammonia, which is well known to yield azote by its decomposition, appears to have been formed without its presence, and if so, the azote must have been derived from the combination of some of the elements enumerated. At present, however, and until further experiments have elucidated the subject, we must continue to regard azote as an uncombined body, and to class it among the elements.

We shall now state various other modes of procuring azotic gas from atmospheric air, in addition to those already mentioned; and we shall conclude with noticing its production by the decomposition of some of the chemical compounds.

It may be separated from atmospheric air by the slow combustion, as it is termed, of phosphorus; thus, by merely exposing a stick of phosphorus, supported by a wire, in a bottle of air inverted over water.

For the exposure of the gas, iron filings, or iron burnings, in a bottle inverted over water, the metal oxidizes, and the azotic gas is left; this acts even more slowly than the phosphorus in the above experiment.

By the agitation of mercury and lead in a corked bottle, for a few minutes, a black powder is formed, which is probably a mixture of an oxide of lead with finely-divided mercury: azotic gas is left.

The passing of atmospheric air repeatedly over iron, or some other metals, hastened to redness in a tube.
The exposure of air to a solution of sulphuret of lime, or of sulphuret of potash in water: this operation is rather slow.

By mixing over water 100 measures of air and 80 measures of nitrogen gas, nitric acid is formed and absorbed, and about 80 volumes of the gas remain nearly pure.

A mixture of 95 volumes of hydrogen gas over water, and passing the electric spark through the mixture about 80 measures of nearly pure nitrogen gas are left.

By passing electric shocks repeatedly through atmospheric air, we can form a solution of nitric acid which is, however, formed and absorbed, and nitric acid is left: the operation is extremely slow. [See Nitric Acid.]

Nitric acid may also be obtained by decomposing ammoniacal gas by the action of nitrous oxide gas; nitric oxide gas is formed by nitric oxide gas and the action of potassium; by the decomposition of nitrate of ammonia with acid; this last experiment requires certain precautions. (Silliman's Journal, vol. xviii. p. 258.)

Lastly, when flesh is heated in a retort with distilled nitric acid, nitric acid is also obtained: but whether it is derived from the animal matter or from the acid, has not been satisfactorily ascertained.

AZOTUS. [See Aztec.]

The Aztecs is the name of a tribe who settled last in that part of America now called Mexico, or New Spain. They were living as a tribe about the year 1160 of our era, in Aztlan, a country situated to the north of the Gulf of California, on the west of the United States. The tribe, when they left Aztlan, availed himself, as it is said, of the chirping of a bird to persuade the men to leave their native abode. Having crossed the Rio Colorado, or Red River, at a point beyond 35° N. lat., they proceeded south-eastward to the river Gila, where they lived for some time, as appears from the ruins of certain ancient buildings found on the banks of that river. After dwelling in several places, they arrived at Huesoehuacan, or Culiacan, 24° 34' N. lat., 108° 1' W. long. Here they remained three years, formed their calendar, and constructed a wooden image of their god Huittolohchiti. In 1196 they arrived at Tula. From this place they removed, in 1216, to Zumpanco, in the valley, where afterwards the city of Mexico was founded. They were kindly received by the chief of that place, Tocapanexcatl; and after wandering some years about the lake of Texcoco, they finally settled at Acoccolo, a group of islands in the southern extremity of the lake. The chief of Colhuacan waged war against them, and in 1314 reduced them to slavery. In this wretched state they lived for nearly half a century at Tzcapan. A service which the Aztecs rendered to their masters in a war between the Colhuiscans and the Xochimilcians was the means of procuring them their liberty. (Clavigero, p. 166.) The Colhuiscans asked their masters for some victim to offer to their god, and that they were presented with a dead bird, wrapped up in a piece of coarse stuff. During the night the Aztec priest offered a bird, a hawk, in the altars placed instead of some odoriferous plants, and a knife of steel or obsidian. On the following morning they invited the Colhuiscans to the festival, and bringing out four prisoners whom they had converted, the priests sacrificed them in the horrid manner, and afterwards practiced the. Aztecs. The Colhuiscans, horror-struck at this scene of blood, ordered this cruel tribe to remove from their territory. The Aztecs then fixed their abode in Auctliut, and were able to separate themselves still further from their masters, proceeded to Tzitzocinco, a group of islands, which were situated in the western part of the lake. On one of these islands they found an eagle perched upon a nopal, which grew out of a rock, and they selected that spot for their permanent abode, in compliance with the oracle of their god, who gave them that omen as a sign of the termination of their migration. They built there a wooden teocalli or temple to their idol, and encompassed it with houses, giving the place the name of Tenochtitlan, the new home of the Aztecs. The name also on a later occasion, from the name of their god of war, Huittolochiti, or Moctli, from which the present name of Mexico is corrupted by the Spaniards. This event, according to the Aztecs, took place during the year of the rod of the three suns (11125 of our era). They divided their city into four quarters, each of which they dedicated to some particular god, to whose honour they built a teocalli.

In 1338 discard arose among them, and the tribe was divided and met with fortune, one part settling north-west of the teocalli of Moctli, where they built a town, called at first Xaltiocolo, and afterwards Tlatiocolo, which was conquered and united to Tenochtitlan under the reign of Axayacatl, about a.D. 1464.

The government of the Aztec was at first aristocratical. A body of twenty men of the most distinguished in the tribe presided over the affairs of the nation. In 1337 they altered this form of government, and chose for their king Acamapichtli, a noble chief of their own tribe. The latter divided the country into certain districts, each of which was placed under a governor, and this governor was the representative of the king. At his accession, the king of the Aztecs, ruler of the Tezcuintli, the second king of Mexico, it was established as a law, that four of the nobles should elect the king out of the collateral relations of the deceased monarch, so the exclusion of his children. This law continued till the destruction of the empire. Motecuzoma-Ihuacamitli, the first of that name, was the great legislator of the Aztecs. He also erected the great teocalli of Mexico, made several important conquests, and after the great inundation, which took place in 1446, ordered the construction of a magnificent dyke, nine miles long and six feet wide. In a succession of wars with the surrounding states, the Aztecs extended their dominion over all the country comprising the modern districts of Vera Cruz, Oaxaca, Puebla, and Mexico, according to Humboldt, from 18,000 to 20,000 square leagues.

Until the latter times of the empire, the royal authority was restrained within very narrow limits. The emperors were not allowed to undertake any affair of importance which could affect the community, without first obtaining the consent of the three supreme councils of the nation. These councils were composed of the nobility. With the power acquired by conquests the emperors gained every day more ascendancy over the nation, until, under the reign of Motecu-

sum II., the Aztec government degenerated into a complete despotism. When the king was chosen he was consecrated with many fantastic and superstitious ceremonies by the high-priests, after which he was compelled to fast rigorously for four days; then he went to war in order to procure prisoners to serve as victims at the festival of the coronation. When the king returned from this expedition he was solemnly crowned. The crown was a sort of masque, made of thin plates of gold and ornamented with feathers. The mantle was a square piece of cotton stuff, with stripes of deep blue and white colour. The principal servants of his household consisted of a grand-steward, and the treasurer of the jewels. The latter was at the same time the head of the custom-house, and exercised the police and auditing of the financial accounts. The king, the priest, and the other officers in the king's household were held by the first nobility. Other nobles superintended the cultivation of the lands belonging to the king, and had the usufruct of them. These noblemen acceded to the king during his absence, and each presented him with a nosegay on certain occasions.

When war had been decided upon against any nation by the king and his counsellors, an ambassador was sent to the chief of that nation, in order to interest him in the war and to propose the means of avoiding it. If the chief submitted to the terms proposed, peace was granted; if he refused, two successive embassies were sent, the first to the most influential men in the nation and another to the chief people. After that, the polishtes and the setting of gems. All the offices in the king's household were held by the first nobility. Other nobles superintended the cultivation of the lands belonging to the king, and had the usufruct of them. These noblemen acceded to the king during his absence, and each presented him with a nosegay on certain occasions.

The dignity of the last-named was the first in the state after the emperor. There were besides the princes and other officers, who were always chosen out of the nobility, gradually rose from the rank of the common soldier. A new saviour was at first employed in carrying the emperor in the most sumptuous and gorgeous of his masques. He was almost naked. When he entered, he carried a prisoner in chains, with a dower of flowers, which was the first sign of promotion in the army; when he captured four enemies
he received likewise a mantle having two stripes of black and yellow, and a fringe round. They had three military orders, called those of the princes, of the eagle, and of the oculto, or American tiger. The first was the most honorable, and its device consisted in a great crown having a broad bar across it, in front of which was a shield, and on that the points of the eagle, with its beak and tail pointed upward. The hair was usually cut short, and hanging from it as many tassels of cotton as the feast of valour he had performed. The defensive arms of the Aztecs were the shield, the cuirass, and the helmet. The shields were made in various forms, some round, others oval, one being covered with feathers, or of turtle-shell covered with plates of copper, silver, or gold. Some of these shields were large enough to cover their bodies entirely, and were made so that they could be folded together and carried under the arm. The cuirass was made of cotton quilted, and were arrow-proof. Their helmets were made of wood, in the shape of heads of tigers, serpents, and other animals. Their offensive arms were sling, club, javelin, spear, club, and club. They also made use of poisoned arrows. Their sword was a piece of some hard wood, three feet and a half long, the edge of which was formed of obsidian. The first blow of this weapon was terrible; but it was then rendered useless. The judicial system of the Aztecs showed no small degree of civilization. A supreme judge, called cihuaacoatl, decided definitely in all matters, both civil and criminal, and appointed inferior judges and fixed the revenues. A tribunal composed of three judges, called tlatcociatl, decided upon all the cases in the first and second instance. These judges sat every day to hear all the causes brought before them. In civil matters there was an appeal from this tribunal, but not in criminal cases. In every quarter or division of the city there was a certain magistrate elected annually by the people, called tecuiti. This magistrate judged in the first instance, and was obliged to give an account every day to the general council that had been chosen in his peculiar district. These tecuiti had other inferior officers under them. In every commune there were municipal officers elected by the inhabitants. There were also officers who patrolled and watched during the night. In matters of importance the judge took a Roman standard. Every month, or rather every twenty days, all the different judges assembled before the king, when all the causes still left undecided in their respective tribunals were finally settled. There was voluntary homicide, robbery of gold or silver, theft in the market-place, adultery, and incest, were the crimes visited with the utmost rigour of the law. Drunkenness in a young man was punished by hanging, and throwing the body of the deceased, if he was of a rich family; if he was one of the common people, he was made a slave for the first offence, and hung for the second. At the age of seventy, a man or a woman might get intoxicated with impunity. No advocates were in use among the Aztecs: the criminal himself conducted the defence of his own cause. No other proof could be adduced except witnesses, and in the absence of witnesses the criminal was allowed to clear himself by an oath. They swore by the sun: the form of taking this oath was to touch the ground with the edges of a leaf, and to their eagle to the earth. The right of private property was fully understood among the Aztecs. The lands were held by different tenures: some possessed them in full right, and were allowed to transfer them either to their relatives, or others who had an interest in them, and consequently could not dispose of them. The lands were apportioned among the king, the priests, the nobles, and the people. Of these the nobility alone were full possessors; the other three merely enjoyed them in common; and the produce was deposited in storehouses, from which all the inhabitants were supplied gratis according to their wants. In their paintings the lands of the king were painted red, those of the nobility scarlet, and those of the people black. The inhabitants of the conquered countries were obliged to pay a tribute in kind to the king, both of the produce of the field, and of their industry, and there was a storehouse in every town in which the produce of this tax was deposited, and proper officers were appointed to collect it. Slavery was admitted among the Aztecs. Slaves were either bought or persons became so as a punishment for certain crimes, but the son of a slave was in all cases a free man. The Aztecs had some imperfect idea of a Supreme Being, absolute and eternal, to whom worship was due. They believed him to be invisible and incorporeal, and therefore not represented in either painted or sculptured. They gave to this being the name Tlaloc. The names of Ipalnemoani, him by whom we live, and Tloque-Nahuas, he who has all in himself, were also given to him. But the knowledge of this supreme being was obscured by the adoration of the elements and spirits of nature. The existence of an evil spirit, called by them Tlacoteocolotolin, whom they supposed to be always employed in causing evil to mankind. The souls, both of man and beast, they believe at the time of death to ascend into heaven and to become immortal. According to their notions of a future state, there were three different mansions where men enjoyed a future state of existence. The first was the house of the sun, where the soldiers who fell in battle, and the women who died in childbed, were received. It was the daily occupation of the spirits of the departed warriors to hail the sun with hymns and dances on its rising, and to accompany it to the zenith, where it was met by the female spirits, who in like manner escorted the great luminary in the rest of its course. After a period of four years had elapsed, they were formed into birds, owls, or in other animal form, but with plumes, and ascended into heaven to breathe the pure ether, or occasionally descended on the earth, where their time was passed in singing and inhaling the perfumes and flowers of the earth. The second was the home of Tlaloc, or the abode of the god Tlaloc, the god of water, who was the place that the spirits of young children who had been sacrificed to that god, and of all others who had died of certain diseases, inhabited: in this place they were regaled with every sort of delicacy that could procure delight. The third abode was the Mictlan, or hell, where Mixtlanecuhtli and Mixtlanecuatl, the god and goddess of hell, reigned. This place was destined for those who died in any other way. In this place the departed spirits suffered nothing from the inconvenience arising from the complete darkness of the place. The Aztecs supposed that four successive revolutions had at different epochs destroyed mankind. These epochs were called ages or suns. The first was called the age of the earth, which took place 5206 years after the creation of the first sun, in which the giants, who had then dominion over the earth, were destroyed by famine, and those who escaped from this scourge were devoured by the birds. The second epoch was time, and happened 4804 years after the preceding epoch. At this epoch the world was destroyed by fire; and as the birds only could escape the general conflagration, men were changed into birds. A man and a woman were, however, in a cave in the earth, of the thickets of which the aloe was the chief, and which was like the mouth of a dragon; and an old man, who was the god of wind, happened 4010 years after the age of fire. In this revolution the world was destroyed by violent hurricanes, and the few men who escaped were changed into apes. The fourth epoch, Atontub, the age of water, happened 4008 years after the preceding revolution. In this revolution a universal deluge occurred, in which all men were changed into fishes, except a man and a woman. This privileged pair were saved in the hollow of a tree: the children of this tree were all born the same day, and had the same name; but every child learned a different language. The duration of these four ages, which, according to Humboldt's interpretation, is, as we have stated, 18,028 years, does not exceed 1477 years according to the interpretation of the text. (See Humboldt's lectures, vol. ii. p. 209.)

In all the European historians who have written on the antiquities of the Aztecs, the order of these revolutions is different; the age of water being placed first, and that of fire last. This is the order according to their reading the painting which represents this part of the Aztecs' history from left to right, beginning at the top, instead of reading from right to left, beginning at the bottom, which is the system adopted by the Mexican and Spanish writers. Alva Ixtlilxochitl, in his account of the conquest: he was a great grandson of the last king of Acolhuacon. His history of New Spain was in manuscript, in the library of the Jesuits at Mexico.
Besides the supreme being, the Aztecs worshipped innumerable divinities, the principal of which were thirteen. Every trade and profession had its particular god. They had besides their household gods, of which the king and the first noblemen had six, the inferior nobility four, and every plebeian two. These divinities were worshipped by offering to them, each day, of the victims, of their animals, of their dishes, of their fruits; by prayers, hymns, fasting, and other rigorous penances, in which the worshippers frequently shed their own blood. The human sacrifices were so horrible, that the simple recital of them, and the numbers of them, is of itself enough to quench the curiosity of the Mexican historians calculate that no less than 20,000 victims perished every year, but this must be a great exaggeration.

The priests were very numerous. Besides serving in the temple, they were employed in the most important business of the young people, in teaching them to read and write, and in forming and regulating the calendar, in composing hymns, and in other scientific and literary pursuits. The body of the priests was subject to two high priests, the Teocuitlatl, or divine lord, and the Izquidero, or high priest; both offices were elective: but it is not known whether the electors were the body of the priests themselves, or the electors who appointed the king. In Acolhuacan the high priest was always the second son of the king. (Clavigero, vol. ii. ch. vi. p. 39.)

There were also persons of both sexes devoted to the service of the gods, who lived in retirement, practising very severe austerities.

The Aztecs had two ceremonies, resembling the circumcisions of the Jews and the baptism of Christ. A boy child who was devoted by his parents to the service of the temple was consecrated by the priests by making an incision on its breast with a knife of obsidian. A child of either sex, four days after its birth, was taken by the midwife to the court of the temple, and there given to the care of a house, where a ceremony analogous to our baptism was performed.

The Aztecs attended very assiduously to the instruction of their children. In general, every child followed the profession of his father. From their third to their fifteenth year they were under the charge of their parents.

At the age of fifteen they were sent to the temples, or to some private school, to be taught those acquirements which their parents were unable to impart to them. The education of the Aztec youth is described in the Conquest of Mexico, book iii. chap. xiv. (Aguilar, Antiquities of Mexico, vol. 1.)

When a man and a female had arrived at a proper age, which for the former was twenty or twenty-two, and for the latter seventeen or eighteen, the marriage was contracted by the means of a female negotiator who was sent to the bride that the father of the youth had chosen for his son. This woman, accompanied by four other females, with lighted torches in their hands, carried the bride upon her shoulders to the house of the bridegroom. There the ceremony was repeated by the eldest brother, who, after fumigating her with copal, introduced her into the house. The couple were placed upon a mat by the fireside, and the female negotiator tied together the end of their garments, in which ceremony they made the marriage contract. An elderly man and woman, who, at the same time acted as witnesses to the ceremony, then delivered a speech to the newly married couple, and presented them with some food. Four days after they went to the temple to offer to their god the fruits on which they had slept.

The ceremonies which the Aztecs paid to their dead were not less singular. As soon as any one died, a certain master of ceremonies first covered the body with pieces of the paper of amate, and sprinkled the head with water; then he dressed the corpse in a garb of cotton and the particular god or gods who were the patrons of the profession or professions which the deceased had followed in his lifetime. Under this dress they placed a flask of water for the journey which the deceased was going to enter on, and then the body of the deceased was placed upon a coffin, in virtue of which he would be allowed to pass through different places in his voyage. The body was afterwards burnt, with all the ornaments, arms, instruments, and tools of the trade of the deceased, and with a tezcatlipoca, a representation of the deceased, of all the master of ceremonies was kindling the fire, some priests sung funeral hymns. When the body was consumed by the fire, they placed the ashes in a vessel, with a gem or more or less value, according to the means of the deceased's family, and this funeral urn was buried in a deep hole, and libations of pulque offered upon it for several days. With the bodies of kings and great lords, their priest, some of their wives, slaves, and other servants of their household, were killed and then burnt. Those who died of leprosy and other diseases, or before attaining the age of seventeen, were burned without burial; their bodies were placed in niches made of stone and mortar, sitting upon a chair surrounded by their arms, and wearing many valuable jewels. They had no appointed place for burying their dead; some burned them in their own gardens, and others in the teocuitlalli. The ashes of the kings were deposited in a special vault.

The manner adopted by the Aztecs of computing time shows that they had attained a certain degree of astronomical knowledge. They had a solar year of 365 days divided into eighteen months, of twenty days each. The year was divided into four periods of six months each. The length of the year was estimated at twenty days, and by this period the calendar was completed. The names of the months were: Tizoc, a stone, or a rock; Teopalli, a flint; Tepoztlan, a house; and Caltli, a house. The first year of this century was called first rabbit, the second second cane, the third third flint, the fourth house, the fifth fifth rabbit, and so on, till the hundredth ended with the thousandth rabbit. The second period began with the first red, and then followed second flint, third house, and fourth rabbit, and so on, till the hundredth ended with the thousandth rabbit. The second period was flint, house, rabbit, red, and that of the fourth, house, rabbit, red, and flint. The age was represented in their paintings by a circle formed by a serpent biting its tail, and forming four foldings with its body, which corresponded to the four indictions. In the centre of the circle they painted a face representing the sun, and round it the images of a rabbit or hare, a red, a knife of flint, and a house, and upon each sign the number of that sign expressed in dots or round. Their year, according to the computations of Clavigero (vol. ii. p. 231), began on the 26th of January, on the first year of the cycle; but every fourth year it was an intempetant one day, and on the last year of the cycle it began on the fourteenth of the same month, because of the thirteen intercalary days of the leap year. According to Humboldt (Researches, p. 132), the beginning of the Aztec year varied from the ninth to the twentieth day of January.

The day was divided into eight parts, four of which were for the rising and setting of the sun, and two for an passage across the meridian, corresponding to the third,
nia, fifteenth, and twenty-first hours of astronomical time. They ascertained the hour in the day-time by the sun, and at night by the stars. The names of different months were taken from some festival, or from some circumstance, which usually happened in the month, and the same was observed with regard to the names of the days. The days were all designated by a particular name. At the end of every xuthumspilli they held a religious festival, somewhat analogous to the sabbatical year of the Jews. On the eve of the festival they destroyed the furniture of the temple, and put it into the Clupigeras, where it was consumed and consumed by the fires. On the evening of the same day, some priests proceeded from the principal temple into a neighbouring mountain to kindle the new fire. The priests always set out in proper time to arrive at the place a little before day-light; a feather or musk in their hands. As they entered the houses with their faces covered, as the Aztecs believed that they would be changed into wild beasts if they witnessed the ceremony; the men stood in anxious expectation upon the terraces of their houses awaiting the result, for they fancied that if the priests did not succeed in obtaining the new fire the world would be destroyed. The fire was procured by means of the friction of two dry pieces of wood upon the breast of a prisoner, who was afterwards sacrificed upon the mountain. The wood was lighted to the duty, and, having lighted the fire in the temples, they distributed among the inhabitants a portion of this sacred fire.

The next thirteen days were spent in supplying their houses with new things, in the place of those which had been consumed.

The Aztecs had made some progress in the arts of social life. The monuments of architecture, sculpture, and painting which still exist, though very far behind that degree of perfection which these arts had obtained among ancient nations, are still impressive. The Aztec painters had no knowledge of perspective, nor of light and shade. Their designs are coarse and smooth; their figures are fantastic, and only drawn in profile; but they are remarkable for brilliancy and dignity of outline. Their sculpture exhibit a far superior degree of excellence. The Aztecs were also acquainted with the art of casting in metal figures of natural objects. Their mosaic, or rather works of embroidery, were admirable. The method they adopted was to glue feathers of different colours upon a piece of canvas, and then place it upon a tablet of wood or a plate of copper. They laid the feathers so even and matched the colours so admirably, as to give to objects thus represented a question of light and shade, which might with greater propriety be called mosaic, they made pieces of shells of different colours. This work was done by separate artists, each one of whom undertook a certain part of it, and then another artist arranged the different parts of the works of architecture, and painted, a question. The Aztec language is very regular in its construction, and abounds in words adapted to compliment. The word nolazomahuites iconaxtlicui, i.e., my esteemed lord and revered priest, is given to a Mexican in addressing a priest. This word is thus analyzed by Clavigero, no, my, tlazontli, estleem, mahui, revered, teopequixi, god-keeper, priest, tail, father.

The Aztecs cultivated the arts of oratory and poetry. Few of their moral, religious, historical, and dramatic performances have reached us. They had orators, who spoke on certain public occasions, such as on embassies, elections of kings, marriages, and other ceremonies. Specimens of these discourses have been transmitted to us by Father Sahagun in his Historia General de Nueva Espana. (See Aglio Antiquites of Mexico, vol. vii.)

The Aztecs were not acquainted with the art of alphabetic writing, but represented past events by means of hieroglyphics. They drew these signs into clay, burned them in the fire, or by such a part of them as was considered sufficient to convey the meaning of the painter. To record the events of their history they painted round the canvas the signs of the days of the year, and cut them by each other, representing the event which at that period had taken place. In writing any series of hieroglyphics, Humboldt says that their order was from right to left, beginning at the bottom of the page and proceeding upwards; but Clavigero says, that in the time of the Aztecs, when the lines of the canvas, he proceeded horizontally from right to left, if he began at the opposite superior angle, he continued perpendicularly downwards; if he began at the left inferior angle, he proceeded horizontally to the right; and particularly upwards when he began on the opposite inferior angle. We have seen a series of Aztec hieroglyphics.
AZU. DOMENICO ALBERTO. was born at Sassari, in the island of Sardinia, about 1744. He applied early to the study of the law, and paid particular attention to the maritime regulations, which have often been matter of dispute between nations. Azuni becoming known as a distinguished jurist, was made a senator and judge of the tribunal of commerce and of the admiralty of the king of Sardinia. In 1795, after the French had taken possession of Nizza, Azuni published his Sistema universale dei Principi del Diritto Marittimo dell' Europa, in which he endeavoured to reduce the maritime laws to fixed principles. He afterwards ceased his work, and published it in French at Paris, with the title of Droit Maritime de l'Europe, 2 vols. 8vo. 1805. The first volume, which is historical, is a recapitulation of the principal maritime regulations and usages of different nations, ancient and modern. Great warmth is here displayed against what is called the assumption of superiority by the British navy over the flags of other countries, and its disregard of equal rights on the sea, and especially of the rights of neutrals, which formed at the time a subject of loud complaint on the part of Bonaparte's government. The second volume discusses the maritime rights of nations in time of war. The author shows himself decidedly favourable to the practice of arming privateers, and seizing the merchant-vessels and property of persons belonging to an enemy's country, a practice which, although general, has been reprobated by several writers. This work recommended Azuni to Napoleon's ministry, who appointed him one of the commissioners for the compilation of the new commercial code, and entrusted him with the task of preparing a work on maritime law. In 1807 Azuni was appointed president of the Court of Appeal at Genoa, which city and territory had been annexed to France. He was afterwards elected member for the same legislative corps sitting at Paris. Here he published his Essai sur l'Histoire Générale des Polices de la Sardaigne, 2 vols. 8vo., accompanied by a map of that island, the draught of which was taken from the archives of Turin. The second volume is entirely occupied by the natural history of Sardinia. Azuni may be said to have been the first writer who made Sardinia known to the rest of Europe; but since the publication of this work other writers have given a fuller account of that interesting island. In 1809 Azuni wrote a pamphlet, in which he searched in the Roman literature of the ancient and modern time. This engaged him in a warm dispute with those who maintained the prior right of the Italians to the discovery, and especially with the orientalist Hager, professor in the University of Paris, who refuted Azuni's book. Azuni published his Dictionnaire de Maritimes et des Navires, which is much esteemed, and of which a new edition was published at Leghorn in 1822. He continued his functions in the tribunal of Genoa until the fall of Napoleon, when, like many others, he lost his situation. He then withdrew first to Nizza, and afterwards to his native island of Sar- dinia, where the late King Charles Felix appointed him judge of the consulate of Cagliari, and librarian to the University of the same city. He died at Cagliari in January, 1827. He also wrote several other works, among which were: Memoire pour servir à l'Histoire Marine des Marines du Roy de Sardaigne, and Memoires pour servir à l'Histoire Maritime des Naviculaires de Marseille. Azuni was member of several academies. (Biografia degli Italiani Venti.)

AZURITE, a term used by Phillips to denote lapis lazuli, under which name this mineral is most generally described by mineralogists. [See LArgile.] It is different from azure-stone, by which name lapis lazuli, the talc-murium of painters, is sometimes known.
B, which occupies the second place in the Hebrew alphabet, and those derived from it, is the medial letter of the order of labials. It readily interchanges with the letters of the same organ. 1. With v, as habare Latin, ovare Italian, to have; habladus Latin, overse Ital. I had. In Spain, and the parts of Spain, corresponding to p, it is always found in words which in the kindred languages prefer the v. This peculiarity has been marked in the following epigram by Scaliger—

\[\text{Hand borev antipea metal Vauvoso vossan.}\]

The modern Greeks pronounce the b, or second letter of their alphabet, like a v, thus \(\text{Baulek, Kalileus,}\) is pronounced by them \(\text{vanile}\). When they write foreign words, or words of foreign origin, it is not unusual for them to express their sound of b by \(\nu\) (m p). It appears probable that the ancient Greeks pronounced the b more like the Spaniards and modern Greeks than we do; for they wrote the Roman names \(\text{Farvo, Virgilus, thus—Baffro (Barron), Burgilus (Birgillus).} The Macedonian Greeks wrote \(\Phi\alpha\gamma\rho\iota\sigma\varsigma\) thus—\(\Phi\alpha\beta\iota\sigma\varsigma\) (Philippus).

2. The interchange of m and b takes place very frequently, especially when they are followed by the liquids l or r. This interchange is not two Greek common with other languages, the uniformity soft. Melis, in the same language, means honey, and \(\beta\alpha\iota\tau\iota\) signifies 'I remove the honey from the comb.' So \(\beta\rho\iota\tau\alpha\), the Greek for mortail, and \(\sigma\mu\iota\rho\iota\) the Latin for to die, contain a common root. An interchange of a similar nature marks the difference between the Greek and the Latin: \(\text{molubdes, lead, and the Latin plumbum.}\) If an m in the middle of a word be followed by either of these liquids, the m is retained, but is strengthened by the addition of a b, just as a d inserts itself between n and r. Instances are to be found in nearly all languages: \(\text{mas-emera}, \text{mid-day, was reduced by the Greek ear to meiemorhia; the Latin cumularium, to heap, has been changed to the French combler; the Latin numerarius, number, to the French nombre.}\) This interchange is of too frequent occurrence to be the result of mere chance, and the manuscripts examined are of far greater age than can be accounted for. Thus, if a Latin word contain the letters \(\text{min},\) after an accented syllable, we find in the corresponding Spanish term the syllable \(\text{bra or bra: homine Latin, hombre Spanish, man, femina Latin, hembra Spanish, female;} \text{famina (middle-age Latin), hambre Spanish, hunger.}\) (See Alhambra.) This corruption arises from a previous interchange of the \(\text{n into an r, as in dncoee Spanish, deacon, discer in French. The Spaniards have carried this corruption even further, by changing the Latin suffix \(\text{tudina (tudor) into tumbra or dumbr: consetudinae Latin, costumbre Spanish, coutume French, custom; multitudinae Latin, muchedumbre Spanish, multitude.}\) 3. Interchanges with p. Of this the Greek \(\text{pe-leu, pelleu},\) the name of the English language by the Welsh and Germans presents sufficient examples. 4. With f. Thus the term \(\text{lirf-wards appears to have meant originally, lirf-wards, body-wards, from the German in, body. The word was probably introduced by the Hanoverian Dynasty.}\)

5. Before a vowel in the old Latin language became s in the more common forms of that language. Thus, in the old writings of Rome, we find \(\text{dunums, wood, dianem, dam, war, &c. in place of bonum, beliu, belheu.}\) The Roman admiral Dullus is sometimes called Bilius; and in the same way we must explain the forms \(\text{bas (bass) twice, and siguini (sini-gini) twenty (sinamny) compared with thir, &c.}\) 6. Before a vowel has taken the form of a soft g or j in several French words derived from the Latin: \(\text{combiare (a genuine Latin word), chanter, French; rubus, rage, French; Dibson, Dynum; so rough has for its parent some derivative of ruber, and rage is from com.}\) 7. In some dialects of the Greek language it has been as perfectly as in English the sound of an m before the initial r, where the other dialects omit it: as \(\text{bradon, a rose, &c.}\) Again \(bl\) and \(gl\) are interchanged in dialects of the same language. Thus \(\text{balones Greek, and glane Latin, are related words, as in English,}\) but in Latin, signifying 'soft' or 'softly, called \(\text{magnus Greek, which has the same signification. For the forms of the letter B, see Alphabet.}\)

In the Sanskrit alphabet the letter \(\text{b is placed in that division of the consonants called mutes, and in that subgroup of the mutes called labials. The subdivision of labials contains four letters—p, ph; b, bh; and m. The p and ph are called hard (sord) consonants; the \(b\) and \(bh\) are called soft (sonant) \(bh\) is the aspirated sonant. (See Journal of Education, N.o xvi, p. 341, &c.)}\) B (in music), the seventh note of the diatonic scale, answering to the \(\text{si of the Italians and French. In Germany it is always signifies B-flat, B-natural there taking the name of B, but also stands for base.}\)

**BAAL** (from the root יָבָל, be governed or possessed) means literally lord, owner; hence also Ahabed. Baal, with the definite article, יָבָל, the Baal, means the deity of the Phoenicians and Carthaginians, whose complete title seems to occur in a Maltese inscription, יָבָל הַבַּת הַבַּת. Malkereth Baal Toor, i. e. King of the City, Lord of Tyrus. (See Philosoph. Transact. T. 34 pl., l. 1.) The name Malkereth is a contraction of יָבָל הַבַּת, king of the city.

Hence it appears likely that Baal and Malche are names of the same idol. The cruel worship of Baal, together with that of Astarte, was frequently introduced among the Israelites, especially at Samaria. As the Greeks, Germans, and other nations frequently form the names of men by combining them with the names of God (e.g. Gotthob, Gotthold, Parchegoll, Geierlos, Georgius, Yehuda, &c.), so the Phoenicians and Carthaginians frequently formed names by composition with Baal, as Ethbeal (יהבאל, with Baal, the name of a king of the Sidonians (1 Kings xvi. 31), whose Josephus calls יָבָל יָבָלָא, from יָבָל וָבָל. i. e. with his Baal; Jerubabel, יָבָל, i. e. Baal well beheld it. Hannibal is written in Punic inscriptions יבאל ויבאל. i. e. grace of Baal; Hasdrubal ייבאל ויבאל, i. e. help of Baal.

In Hebrew also many names of cities occur, compounded with Baal; as Baal-Gad, Baal-Hammon, Baal-Thamer, &c. The statues erected to Baal were called Bealim, יָבָלִים. The temples and altars of Baal were strikingly built on the tops of hills under trees, and also on the roofs of houses.

The worship of Baal gave employment to a numerous priesthood, who were invested in, sacrificed children, danced round the altar, and if their prayers were not heard, cut themselves with knives and lances till the blood gushed out upon them. By this self-sacrifice, the priests expected to excite the compassion of Baal, and thus to obtain the object of their prayers.

The general character of Astarte idolatry renders it likely that Baal meant originally the true lord of the universe, and that his worship degenerated into the worship of a powerful being in the material world. Sanchonatius states that the Phoenicians worshipped the sun as יָבָל אִישׁ אִישׁ, 'the only lord of Heaven,' called באלגידע, באלדטימ (i. e יָבָל הַבַּת, lord of heaven); and that this Baalism was the Greek Zeus, Ζεύς. In the Septuagint, Baal is called Βαλας, Hercules, called in the Phoenician language יָבָל הַבַּת. On-cul. i. e. light of all. Some mythologists have asserted that Baal was Saturn (compare Somers on Καλλίστα, i. 19), others have considered Baal to be the planet Jupiter. A supreme god might easily be composed of the names of other nations, hence arose this variety of opinions.

The statement of Herodian (i. 3; and Capitul. vet. Macrin.) that the Phoenicians and Syrians worshipped the sun, is confirmed by the name of the name of Baal together with that of the sun on Carthaginian gems and Palmyrene inscriptions, יָבָל נַבָּל, יָבָל נַבָּל. The name of Baal occurs frequently with epithets, as
Beal, Brith (βαλ, βρίθ) i.e. lord of confederacy, or God of trustees, like the Greek Δεξιος, and Latin, Deus Fidius. Beulbeulba, (βαλ, βρίθ) i.e. lord of bliss, corresponds to the Greek Δεξιος, δέξιος, Zeus the fly-chaser (Pausan. v. 14): compare Hercules δέξιος.

Beal Per (βαλ, μέγας) is the Priest worshipped by the Moslems on Mount Beal, from διστέντιον.

To worship Beal signifies frequently, in the phraseology of the Jewish writers of the middle ages, to practise the rites of the Christian religion. Rabbi Joseph Ben Jonas Ben Meir tells us, in his Chronicles, that Chlovis forsook his God, and became a mark for this -delight. And that a high place was dedicated at Paris for Beal Donysius, i.e. the Cathedral of St. Denis. Rabbi Joseph informs us also that the Friar Vincent, of the sect of Beal Donici, i.e. the Dominican Friar, was a Sina unto the Jews in Spain about a.d. 1430.

For further information on Beal we refer to the commentators on Judges, Kings, Chronicles, Isaiah, Jeremiah, Hosea: J. E. Blenner, De Rituo Beael exordium, Ling. 1723; Frommman, De Cultu Deorum ex Omnotheria illustris, Altior, 1745, 4to et seq.; Müller, Religion der Cathagen, Kopenhagen, 1812, 8vo; Serr. ad An. i. 729; Lingua Plancte Deus Bai dictatur, Isidor. Origin. viii. 11; Creutzer's Symbolica, s. 248, &c.; Russell Preparatio evangelica, i. 16; Preparatio Sathanica, etc.; Orelli, has mentioned it in his dictionary, in the Halliche Encyclopedia; Winer's Bibbacheus Rector Wurtzburch; Classical Journal, vii. p. 233.

BAALBEC, or BALBEC, called by the Greeks Helopolis. The City of the Sun, is in Coelesyria, in 36° 1' N. lat., and 35° 38' E. long., according to a map of the Holy Land and Syria, published in Pococke's Travels in 1745. Its situation, however, ought to be elsewhere about 34° 1' 30" N. lat., and 36° 11' E. long., according to Major Rennell. (See his Preparatory to the Correct Geographical Map of Western Asia, vol. i. p. 75.) Major Rennell makes the distance from Tripoli 389 geographical miles, and from Palmyra 109 geographical miles.

Balbec signifies, in the Syrian language, the City of Beal, or the Sun; the Greeks, changing it into Helipolis, as in many other cases, translated the Oriental name, which the Romans appear to have retained, until it was again changed into its original Syrian name, Balbec.

The city is pleasantly situated on a rising ground, near the north-east extremity of the plain of Boctas, and immediately under the mountain-range called Anti-Libanus. This plain extends from Balbec almost to the sea, in the direction of N. E. by N. to S. W. by S.; the width appears to be a few places more than four, and not in any less than three leagues.

The rivers which water the plain are the Litane and the Bardouni; the former takes its rise in Anti-Libanus, a lake to the north of Balbec; the latter rises in a valley at the foot of Mount Litaneus, near a village called Zakely (Wood and Dawkins) or Zahala (Bruce), about eight hours' journey south-west of Balbec. This river joins the Litane in the plain, about an hour's journey from a village called Barallia. Pococke and De La Roque mention also another river called Ais, which they suppose to be the ancient Orentes. It rises in the same plain about eight hours' journey north of Balbec, near a village called Ras. (Pococke's Travels, vol. ii. p. 350.) There is also a great increase of water from a fine fountain close by the city walls, called Ras el Ain, the fountain's head. These streams are augmented by several constant rills from the melting snows of Libanus, and form the river Casimoth, which enters the sea near Tyros. This abundance of water must at all times have rendered Balbec a delightful residence.

When the city was in a flourishing state, it is probable that on its coins it was joined with Tyre in connection with Palmyra, and the traffic with India, may have been very great, and possibly the source of its wealth, and the means of erecting those edifices, the ruins of which still exist. The ruins in front of the great temple, of which a part, if not all, was destroyed by the Saracens, were most probably assigned for Fora (markets or places of business), and are therefore provided with suitable shady porticos and exedras, on which the merchants could conveniently transact their business

* Rouss in commonly written — Baal, Bala, Bala, Bala, and Balaah (Aen. Wood and Dawkins, Bruce, De Keerke, Rouss, &c.)

In the few instances in which the accentuation given in the above Index varies from that given in the body of the work, that in the Index has been adopted after deliberate consideration.
B.

the modern Greeks pronounce the b, or second letter of their alphabet, as β, thus βασιλευς, βασιλευς, is pronounced by them βασιλεβις. When they write foreign words, or words of foreign origin, it is not unusual for them to express our sound of b by μ (mp). It appears probable that the ancient Greeks pronounced the b more like the Spaniards and modern Greeks than we do; for they wrote the Roman names Varro, Virginius, thus — βαρρος (Barron), βιργινιος (Birgilias). The Macedonian Greeks wrote βαρρος thus — βιργινιος (Bilipuss).

2. The interchanges of m and n takes place very frequently, especially when they are followed by the liquids l or r. Thus the letters are very nearly always of the same pronunciation:

- 

mētrikos νευρατικος

- 

μινυστήρ 

M目前, in the same language, means the same, but in Italian, and blatto signifies 'I remove the honey from the comb.' So bro-tos, the Greek for mortal, and mor-i, the Latin for to die, contain a common root. An interchange of a similar nature marks the difference between the Greek melodes and melodes, lead, and the Latin plumbeum. If an m in the middle of a word be followed by either of these liquids, the m is retained, but is strengthened by the addition of a μ, thus διμοσίων, inserts itself between m and r. Instances are to be found in nearly all languages: mētrikos νευρατικος, a still greater change. Thus, if a Latin word contain the letters m, after an accented syllable, we find in the corresponding Spanish term the syllable br or br: homine Latin, hembre Spanish, man; feminin Latin, hembre Spanish, female; feminis (middle-age Latin), hembre Spanish, hunger. (See Almanias.) This corruption arises from a previous interchange of the n into an r, as in dicoons Greek, deacon, diacre in French. The Spaniards have carried this corruption even further, by changing the Latin suffix tūdina (tudo nom.) into tūmbra or duambr: consuetudine Latin, costumbre Spanish, custome French, custom: multitudine Latin, muchedumbre Spanish, multitude. Interchanges with p. Gr. Thus the pronunciation of the English language by the Wedes and Germans presents sufficient examples. With f. Thus the term life-guards appears to have meant originally, leb-guards, body-guards, from the German leb, body. The word was probably introduced by the Hunserean Dynasty. But before a vowel in the old Latin language became b in the more common forms of that language. Thus, in the old writings of Rome, we find domus, good, durus, hard, war, &c. in place of bonas, belles, belium. The Roman admiral Dullius is sometimes called Bius; and in the same way we must explain the forms bus (due) twice, and sogni (due-gni) twenty (seventy) compared with thirty, &c.

6. B: before a vowel has taken the form of a soft g or j in several French words derived from the Latin: conmbris (a genuine Latin word), changer, French; rago, rage, French; Debon, Dyem; so rude has for its parent some derivative of τρυγος, the rage is from cowes. 7. In some dialects of the Greek language it is not so much as an interchange before the initial r, where the other dialects omit it — brdon, a rose, &c. Again bl and gl are interchanged in dialects of the same language. Thus balamos Greek, and plan Latin, signifying 'soft, mild, calm,' and great Great, which has the same signification. For the forms of the letter B, see Alphabet.

In the Sanskrit alphabet the letter b is classed in that division of the consonants called mutes, and in that subdivision of the mutes called labials. The subdivision of labials contains four letters — p, ph; b, bh; and m. The p and ph are called hard (sord) consonants; the b and bh are called soft (romant); bh is the aspirated sonant corresponding to ph the aspirated sord. (See Journal of Education, No. XV. p. 341, &c.)

The modern Greeks pronounce the b, or second letter of their alphabet, as β, thus βασιλευς, βασιλευς, is pronounced by them βασιλεβις. When they write foreign words, or words of foreign origin, it is not unusual for them to express our sound of b by μ (mp). It appears probable that the ancient Greeks pronounced the b more like the Spaniards and modern Greeks than we do; for they wrote the Roman names Varro, Virginius, thus — βαρρος (Barron), βιργινιος (Birgilias). The Macedonian Greeks wrote βαρρος thus — βιργινιος (Bilipuss).

2. The interchanges of m and n takes place very frequently, especially when they are followed by the liquids l or r. Thus the letters are very nearly always of the same pronunciation:

For the forms of the letter B, see Alphabet.

In the Sanskrit alphabet the letter b is classed in that
Baal-Berith, or Baal-Berith, called by the Greeks Helipolis, the City of the Sun, is in Coele-Syria, in 34° 9' N. lat., and 36° 58' E. long., according to a map of the Holy Land and Syria, published in Pococke's Travels in 1745. Its situation, however, ought to be somewhere about 34° 1' 30" N. lat., and 36° 11' E. long., according to Major Rennell. (See his Treatise on the Comparative Geography of Western Asia, vol. i. p. 75.) Major Rennell makes the distance from Tropolis 330 geographical miles, and from Palmyra 109 geographical miles.

Baalbec signifies, in the Syrian language, the City of the Baal, or the Sun; in the Greeks, changing it into Helipolis, as in many other cases, translated the Oriental name, which the Romans appear to have retained, until it was again changed into its original Syrian name, Baalbec.

The city is pleasantly situated on a rising ground, near the north-east extremity of the plain of Bocot, and immediately under the mountain-range called Anti-Libanus. This plain extends from Baalbec almost to the sea, in the manner set forth by N. d'Ohsson, S. de Sacy, and Schiaparelli, to be in few places more than four, and not in any less than three leagues.

The rivers which water the plain are the Litane and the Barakouni; the former takes its rise in Anti-Libanus, and is the largest; the Litane rises at the foot of Mount Libanus, near a village called Zakely (Wood and Dawkins) or Zahala (Bruce), about eight hours' journey south-west of Baalbec. This river joins the Litane in the plain, about an hour's journey from a village called Barailles. Pococke and De La Roque mention another river called Aes, which they suppose to be the ancient Orontes. It rises in the same plain about eight hours' journey north of Baalbec, near a village called Ras (Pococke's Travels). For a description of the Litane, see the account of "Colonia Julia Antonina," vol. ii. p. 172; and for a great increase of water from a fine fountain close by the city walls, called Ras el Aïn, the fountain's head. These streams are augmented by several constant rills from the melting snows of Libanus, and form the river Casimah, which enters the sea near Tyr. This abundance of water must at all times have rendered Baalbec a delightful residence.

When the city was in a flourishing state, it is probable that the advantages arising from its commerce with Tyre, as connection with Palmyra, and the traffic with India, may have been very great, and possibly the source of its wealth, and the means of erecting those edifices, the ruins of which still exist. The ruins in front of the great temple, of which theidea shall almost certainly be correct, are substantially designed for a market or business, and are therefore provided with suitable shady porticos and exedrae, in which the merchants could conveniently transact their affairs. The history of the place itself is very obscure; but from two Roman inscriptions of the time of Antoninus Pius, there can be no doubt that it was then a place of some importance, under the name of Helipolis. These facts are also confirmed by several coins of Roman emperors.

At what time and by whom the city was first founded is wholly unknown; even the epoch when the temples, which from their style must be attributed to the Roman period, were erected, is matter of much uncertainty. The only historical authority for building the temples of Baalbec, is that of John of Malala, from whom we learn that Eliaus Antoninus Pius built a great temple to Jupiter at Helipolis, near Libanus in Phoenicia, which was one of the wonders of the world. (Joan. Malal., Hist. Chron. lib. i.)

The temple of Helipolis was, according to the life of this emperor, does not mention the temple of Helipolis.

From the reverses on several coins of the Roman emperors, we find, first, that Helipolis was established as a colony by Julius Caesar; and again, at a future period, having received part of the veterans from the fourth and eighth legions in the time of Augustus, was eventually made Julia Italicus by Septimius Severus (Ulpianus, lib. i. de Cenab.) and we accordingly find its temple, for the first time, on the reverses of this emperor's coins.

At the same time also that we meet with Helipolis on the coins of Julia Domna and Caracalla, vows in favour of that emperor and empress are inscribed on the pedestals of the columns of a great portico ('marked A on the plan), forming a sort of Propylæa to the extensive inclosures which we conjecture to have been used as Fora by the merchants. Several coins which appear to belong to Helipolis are preserved in the British Museum.

The representations of the temples at Helipolis, impressed on these coins, are not always exact with regard to the form of the temple they mean to represent, as will probably appear in the following instances: — On the reverse of the medal of Septimius Severus, we find a temple, in form like the great temple of Baalbec, and having, like it, ten columns in front with the legend COL. HEL. I. O. M. H. Colonia Helipopolitana Jovi Optimo Maximo Helipopolitano. On the reverse of another medal of the name, with the same legend, there is a temple in perspective, having indeed the same number with both the great and the smaller temple of Baalbec, but with only six columns in front, which is less than the number in either; and the same is repeated on the reverse of a medal of Caracalla. On the reverses of some medals of Philip the Eider, and his wife Otacilia, we find the same temple with a temple of a different form and size, bearing no resemblance to any of the temples of Baalbec. Upon the reverse of another medal of the same Philip, we find a fourth temple, which seems to belong to Helipolis, by the inscription, J.U. Aug. Fel. Const. C. Aug. Felix Helipopolitana.' (Wood and Dawkins, Ruins of Baalbec.) On the reverse of this coin, there is a flight of several steps leading to an area, in which is a temple of the form of the great temple of Baalbec. This is all probability an awkward and certainly an incorrect representation of that great temple, with the courts and the steps leading up to them. The propylæa do not appear to

(Copper coin in the Brit. Mus. Actual size.)
have been then built. On the reverse of the coin of Otacilia there is however a tolerable representation of this portico or propylaeum, varying in some particulars from the restoration by Mr. Wood. It would therefore appear to have been added after the first coin was struck.

Abulfaragius says that Constantine built a temple here, and that he abolished a custom of this place which permitted the promiscuous use of wives. (Greg. Abulfaragii Hist. Compend. Dynast., p. 83.) We learn also from the Chronicon Paschale, that while Constantine closed the temples of the pagans only, Theodosius destroyed some, and converted the great and famous temple of Heliospolis into a church. (Chron. Pasch. Olymp. celssxxii., p. 363.) "Church history gives little more than the names of some bishops and martyrs of Heliospolis, and informs us that when Mahometanism prevailed, this part of the country fell under the government of the caliphs, called the Qaumisades, an ignorant and inerous race, during whose time we find only that Balbec was a considerable city." (Herbelot, Bibliothèque Orientale.)

In the annexed cut we have given a plan of the city, principally from the drawings made by Wood and Dawkins, and corrected from a more recent survey by F. L. Cassas.
